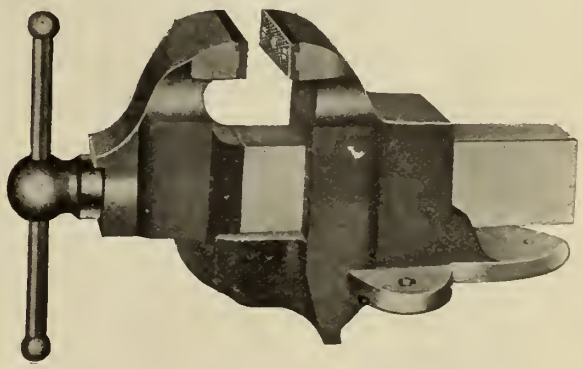
BENCH VISES

Made in Canada and a credit to any country



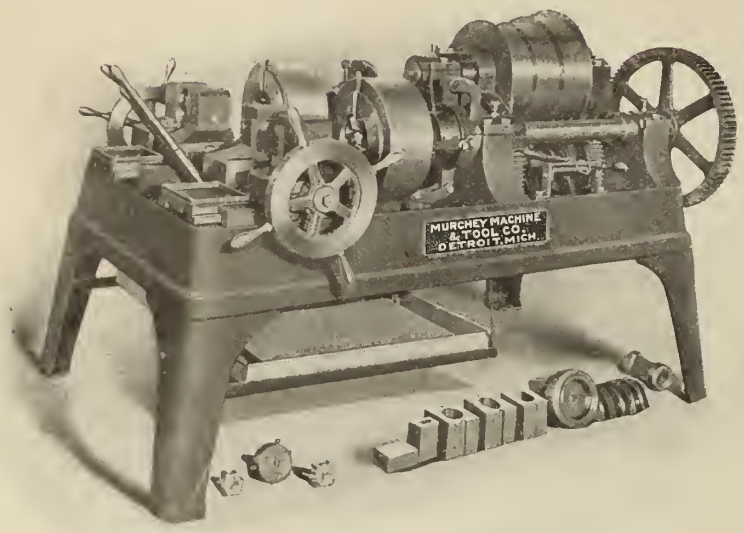
We put the same high-class workmanship on these Vises as we do on our other products.

Manufactured by

THE STEVENS COMPANY OF GALT,
LIMITED
Galt, Ont., Canada.

Also Manufacturers of Drill Vises with Jig attachments Milling Machine Vises, Bench Vises and Pattern Makers' Universal Vises, etc.

The Time Saving Features



of MURCHEY NIPPLE and PIPE THREADING MACHINES count a lot when it comes to close figuring. One "Murchey" will cut more threads in a given time than any three machines of other makes, and produces absolutely uniform work.

The No. 3 machine, as shown, threads and reams at one operation, has capacity for pipe from 1½" to 4", inclusive, and will thread 300 four-inch short nipples complete in ten hours time. Dies open automatically, so no attention is required after the thread is once started. Gripping chuck jaws will not slip nor crush the pipe; all adjustments easily made. If you are interested in first-class Pipe Cutting Machines, you need our Catalogue, sent on request.

We also make the Murchey Improved Tapping Machine with Frictionless Driving Head

Murchey Machine and Tool Co. Corner 4th and Porter Streets DETROIT, MICH., U.S.A.

WHAT THE MERRELL MEANS TO YOU.

Simplicity of Construction.

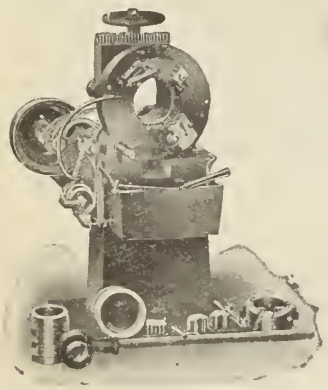
Ease of Control and Operation.

Speed in Cutting either Iron or Steel—Rough or Smooth—Pipe.

Exactness—Not a machine leaves our factory until it has passed the MERRELL test, which means not until it has undergone every test for any kind of work it could be called upon to do—is the reason why we can give you this.

COMBINED HAND and POWER MERRELL
FOR FULL 30 DAYS FREE TRIAL.

We know it will do all your work in an easier, less costly and speedier manner.



This machine has great range of work. Our improved cutting-off tool cuts cleanly and quickly. Quick opening and closing die-head; encased gears; exceptionally fine steel chasers that may be released from threading while the machine is in motion.

The Head may be removed from the base and used as a portable hand machine. It will cut any size—any kind—of pipe up to 6-in.

The STURTEVANT SYSTEM of Heating and Ventilation

By a Forced Circulation of Warm Air is Applicable to all Classes of Buildings

The Sturtevant System is Superior to Direct Heating

Because The apparatus is centralized and under one man's control. There is no steam piping scattered around the building. Consequently no danger of freezing or of damage from leaky joints, valves or air cocks. The heater is specially adapted to the use of exhaust steam. Heating can be accomplished with great rapidity. Building can be cooled and ventilated in summer. Humidity can be regulated.

Because Ample and positive ventilation is provided. Quantity and quality of air are under absolute control. Constant temperature can be maintained and air volume varied when "hot and cold system" is used. The heating surface is enclosed in a fireproof casing. The air ducts are fireproof. There is no tendency to noise. Operation is independent of wind and weather.

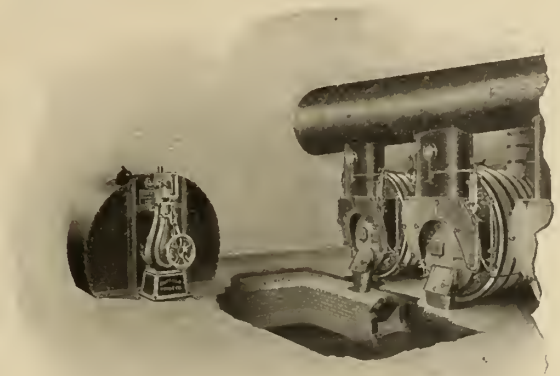
Mechanical Draft

An application of fans for securing the highest efficiency of fuel and the greatest steaming capacity of boilers—Fiske.

THERE is nothing new or irrational about Mechanical Draft—It dates back from the first use of bellows, and is best appreciated in the latest and largest power plants.

Buffalo Electric "B" Volume Exhauster

MECHANICAL DRAFT means a positive control over your boilers. No dependence on weather conditions. No fixed limit to boiler capacity. Quick response to demands for steam.



A typical Buffalo Induced Draft Plant.

Left Hand Bottom Horizontal Discharge Fan with Cylinder below shaft engine.

MECHANICAL DRAFT means no tall, expensive chimneys. Perfect combustion of low-grade fuels. Realizes, in connection with fuel economizers, the highest possible boiler efficiency.

MECHANICAL DRAFT has long ceased to be an experiment, but is well defined and accepted engineering practice. The best results are only possible when installations are designed and executed by specialists in this service. Bring your draft problems to us.

Old and New Tariffs Compared

Speech of Finance Minister Fielding giving the Government's reasons for the changes made—Comments of manufacturers and Jobbers.

Mr. Fielding, in his address in Parliament, referred to the fact that this was the second general revision under his regime. The first one was made in 1898. The Government wanted to encourage stability and not to be hasty in making changes. In the past it had resisted many applications for increases, and he did not believe any severe loss had resulted. So prosperous was the country no radical changes were required In changing the form of the schedules it was proposed to put articles under different classes according to their nature and duty. The free list schedule would be abolished, and each item without duty put in its class in the general tariff with the word "free" opposite, while other articles would have the rates of duties also placed opposite. Articles would be arranged in eleven groups, one of which would be "miscellaneous."

Under the old tariff there were practically four tariffs :

1. British Preference.
2. General Tariff.
3. Surtax.
4. French Treaty.

All these features would be retained, and in addition there would be an intermediary tariff. The general tariff would be substantially the tariff of the day, and not much above the present tariff, but there would be higher duties on a few items. The intermediate tariff, the new feature, would not be put into operation at once.

The British Preference.

The British preference would be adhered to. It had made Canada prominent, and the nation had derived an advantage from it, if it was derived from sentiment. British sales to Canada, which had decreased from 43 millions in 1890 to 29½ millions in 1897, when the preference was given, had now increased to 69 million dollars. The dutiable goods had increased from 20 to 52 millions.

The lower duties on British goods had put so much money into the pockets of the Canadian consumers, the saving to them since the preference was established, being estimated at $28,000,000. In addition, the low British prices had largely governed foreign sales in Canada.

The British preference schedule, while adhering to the general principle of one-third off, would have the duty applied to each specific article, and in some cases this would vary from 33 1-3 per cent. In some cases the preference would be less ; in some higher; but on the whole it would be more favorable to Britain.

Special account was being taken of British metals, and the preference on these would be increased, and would enable Britain to better meet severe competition.

In future articles qualifying for the preference would require to have had 25 per cent. of their value put into them in the shape of British labor. This would prevent foreign countries sending goods here through Britain without work of much cost being done on them here.

The Intermediate Tariff.

The intermediate tariff would grant rates of duties somewhat below those of the general tariff, and on articles averaging a 30 per cent. duty the reduction should amount to 10 per cent., but still leave a material advantage to countries enjoying the British preference. The object of this tariff was to afford Canada an instrument wherewith she could conduct negotiations with any country willing to give her more favorable conditions.

The Drawback Clause.

The object of the clause referring to drawbacks was to prevent the abuse of the free admission of articles granted for a particular purpose—chiefly manufacturing. As to a few of these about which there could be no difficulty, there would be no change, but other articles would have to pay the regular duty, and when it was proved that the particular purpose had been served, a rebate of 95 per cent. of the duty, in the shape of a drawback, would be made

Anti-Combine and Dumping Clauses.

The anti-combine clause adopted ten years ago would be retained. It had been a good thing in smashing the paper combine, which was followed by a reduction of 15 per cent. in duty, and though not often utilized, it had a wholesome effect. The clause provided or the abolition of duties where trusts charging extortionate prices were proved before a judicial committee to exist.

The dumping clause had also served a useful purpose. It would be so amended as to apply to articles on the free, as well as on the dutiable list. The special duty, which, except under certain conditions, has been equal to the difference between the fair market price of the article and the selling price, is, in the case of free goods, limited to 15 per cent.

German Surtax Stands.

The German surtax, would stand exactly as it was. Germany would be liable to the general tariff, plus a surtax of one-third. While there was no likelihood of early negotiations with Germany for a reduction from the general tariff, there was a lively hope of a better understanding as to the surtax. The imposition of the surtax was partly the result of a misunderstanding on the part of Germany.

Iron and Steel Bounties.

In discussing the new tariff and bounties on metals, Mr. Fielding said:

In 1897, we regarded it as important, that the cost of iron and steel to the consumer in Canada should not be too high, because iron and steel at moderate cost are the foundation of an immense variety of industrial enterprises. Therefore, we cut down the customs on iron and steel, and we arranged a system as follows:—On iron from native ore. $3 per ton; upon foreign ore, $2 per ton; upon steel, $3 per ton. These bounties were fixed on a sliding scale, and gradually diminished. Last year they were fifty-five per cent. of the original amount. This year, since the 1st of July, they stand at thirty-five per cent. of the original amount. They will expire on the 1st of July next, under existing legislation. As we have six months to run yet, that means an extension period of three years and a half, four years from the 1st of January, but one-half year is provided under the existing law.

We adopt to some extent a sliding scale. On pig iron manufactured from foreign ore for the calendar year 1907, $1.10 per ton; and for 1908, $1.10; for 1909, 70c.; for 1910, 40c. On steel ingots, we propose, in 1907, $1.65; in 1908, $1.65; in 1909, $1.65; in 1910, 60 cents. Iron bars are treated in the same way as steel ingots, but as they are not made in any considerable quantity, they are not of any practical importance.

To-day the bounty on iron from Canadian ore is 35 per cent. of $3, that is equal to $1.05 per ton. The bounty on iron from foreign ore is 35 per cent. of $3, which is 70 cents per ton. The difference to-day is 35 cents per ton. This

difference is not sufficient to encourage native industry. Those interested have represented that if we could have kept that difference of $1 there would be some inducement, some larger prospect of the development of native ores. We are impressed with this argument, because while we wish to encourage the iron industry generally, we particularly want to encourage iron made from native ore in order to encourage the development of the ores of Canada. We propose, therefore, that the rates of bounty during these four years periods should be as follows:

For the year 1907 the bounty on iron from native ore will be $2.10, and on foreign ore, $1.10. For the next year we keep the figures the same, $2.10 for native ore, and $1.10 for foreign ore. For the third year the bounty on iron from native ore will be $1.70, whereas on iron from foreign ore it is reduced to 70 cents. Then for the fourth year we reduce the bounty on the native ore to 90 cents, and the bounty of the foreign ore to 40 cents, keeping up the difference of 50 cents between the two.

We propose that these bounties shall not apply to articles exported. There are rumors that the great steel trust of the United States may come into Canada to do business in the ordinary way, well and good, but if it comes here to make up iron and steel for export it might add largely to our burden. We think it is well to have it understood that we are giving these bounties for the encouragement of iron and steel for consumption in Canada, and if any parties undertake to export these articles they shall not be entitled to the bounty upon it.

Then there are bounties at present on angles, plates and iron rods. With respect to angles and plates there is a bounty of $3 and a duty of ten per cent. We have decided to abolish the bounty and allow these articles to fall as a rule into a third class at $7 per ton, subject to the preferential reduction. The bounty is at present $3 and the duty ten per cent.; we strike out the bounty and put them in with the usual tariff instead of the bounty in this case.

The result of the change is to give about the same degree of protection but to get rid of the bounties. Articles are now made in Canada to a considerable extent. We would be glad to do the same thing if we could find it convenient in relation to the bounty on iron rods. The difficulty there, however, is that iron rods are not iron articles. They are used by the manufacturers of other lines of goods, and if we impose a considerable duty on iron rods we will have to change the duties on the articles which are made from iron rods, and we do not wish at present to disturb that class of duties, so we continue the bounties we have at present. The other bounties are for fixed periods. The bounty on iron rods was not for any fixed period, and it is like a tariff item which may be changed from time to time.

Benefits of Bounty System.

This bounty question is one of widespread interest, and in some quarters strong objections have been taken to bounties, criticisms of a varied character. Some object to bounties because they are a protection, others because they think bounties are something which impose tremendous burdens upon the country for which the country receives no advantage. I think those who condemn bounties generally, do not stop to consider what would happen if we did not adopt this system. If we did not adopt the bounty system then unquestionably we should be obliged largely to increase the duties on iron, or to allow industries of a considerable character probably to close up, and we do not think that is desirable. Those who think that these bounties can be dispensed with have not perhaps given the matter as careful consideration as they might. These bounties have not been fruitless of good. They have accomplished a great deal in the development of the interests of the country. They have built up great establishments, and have given employment to thousands of men.

Then there is another view which is perhaps lost sight of. If you turn to the customs returns of ports, connected with the iron industry at Sault Ste. Marie, Midland, New Glasgow, Sydney and North Sydney, take all the various points where the Customs Department comes in touch with these iron industries, you will discover that during the period of these iron bounties there has been an enormous development of trade at these ports, the greater part of which is directly due to the development of these industries, and if you make a comparison between the customs revenues of those ports a few years ago, and the customs revenues as they have been under the influence of this bounty system, you will find that the increased collection of revenue at these ports is fully equal to every dollar that the Government ever paid by way of bounties, and so any impressions that may exist in the minds of any that the bounties are not in any way returning anything to the country is certainly a mistake.

British Preference on Metals.

The rates on lead manufactures, including lead pipe, lead shot and lead bullets, have been reduced about 5 per cent. and the preferential rate on lead in bars and sheets has also been reduced from 16 2-3 to 15 per cent.

In item 384 of the new tariff, an effort is made to divert trade to Great Britain, and at the same time to cheapen the cost to the consumer. This item reads:—Rolled iron or steel sheets, number fourteen gauge and thinner, n.o.p., Canada plates; Russia iron; flat galvanized iron or steel sheets; terne plate and rolled sheets of iron or steel, coated with zinc, spelter or other metal, of all widths or thicknesses, n.o.p., and rolled iron or steel hoop, hand scroll or strip, No. 14 gauge, and thinner, galvanized, or coated with other metal, or not, n.o.p. The articles are made free from Great Britain and dutiable from other countries. Tin plate is free under all tariffs, in the interests of manufacturers and consumers. The item has been enlarged by increasing the gauge of iron and steel sheets from seventeen to fourteen gauge, and the gauge of hoop, band, scroll and strip from eighteen to fourteen gauge.

The preferential rate on japanned ware, tinware and all manufacturers of tin, whether "hollowware" or not, also on manufactures of zinc and manufactures of aluminum is reduced from 16 2-3 per cent. to 15 per cent, while the general tariff rate of 25 per cent is continued.

Brass and copper wire, Britannia metal, nickel, silver, Nevada and German silver, etc., are all increased, but it will be observed that the ratio of preference to Great Britain is greater than it was before.

Boiler tubes were formerly dutiable at five per cent. general and 3 1-3 per cent. preference. They are now made free from Great Britain.

Galvanized iron or steel wire, 9, 12 and 13 gauge, formerly on free list is now made a dutiable at five per cent. under the general and intermediate tariffs and free from Great Britain. This is an item of very considerable importance, as over a million dollars' worth was imported last year, mostly from the United States.

Well-drilling machinery for boring and drilling for water is made free, whether made in Canada or not. It was formerly free, but the free admission was confined to such machinery as was not made in Canada. We think that boring for water is a matter of such importance and so we make the machinery free altogether.

A number of articles of iron and steel specified in old tariff are not named in new tariff. They fall under this general item, " manufactures of iron or steel, n.o.p." The principal exceptions are iron and steel castings, in the rough, formerly dutiable at 25 per cent, now 30 per cent.

OLD AND NEW TARIFFS COMPARED

The following table includes practically every artiele in which the machinery and kindred trades are interested. In the four columns are given the British preferential the intermediate, the new general and the old tariffs, the latter being given for the purpose of comparison. The German surtax of 33 1-3 per cent. is the only part of the tariff not included. In a study of the table it will be an easy matter to figure out the effect of the changes, remembering, of course, that the British preferential duty was formerly an even 33 1-3 per cent. whereas now each item stands by itself. For a more complete analysis, such as few will find necessary, it will be necessary to have a copy of the old tariff for reference as the classifications are entirely changed and the table is arranged on the basis of the present tariff.

Group 5—Pulp, Paper and Books.

	British Pref.	Intermediate	General	Former Tariff
Hemp paper, made on four cylinder machines and calendered to between .006 and .008-inch thickness, adapted for the manufacture of shot shells, primers, adapted for the manufacture of shot shells and cartridges, and felt board sized and hydraulic pressed and covered with paper or uncovered, adapted for the manufacture of gun wads	F	F	F	F
Strawboard, millboard and cardboard, tarred paper, felt board, sandpaper, glass or flint paper and emery paper or emery cloth, p.c.	15	22½	25	25

Group 6—Chemicals, Drugs, Oils and Paints.

Glue, liquid, powdered, or sheet, mucilage, gelatine, casein, adhesive paste and isinglass, p.c.	17½	25	27½	25
Lamp black, carbon black, ivory black and bone black	F	F	F	F
Ultramarine blue, dry or in pulp; whiting or whitening; Paris white and gilders' whiting; blanc fixei, satin white	F	F	F	F
Litharge	F	F	F	F
Dry red lead, orange mineral and zinc, white, p.c.	F	5	5	5
Dry white lead, p.c.	20	27½	30	30
White lead ground in oil, p.c.	25	32½	35	35
Ochres, ochrey earths, siennas and umbers, p.c.	10	12½	15	20
Oxides, fireproofs, rough stuff, fillers, laundry blueing and colors, dry, n.o.p., p.c.	15	20	22½	25
Liquid fillers, anti-corrosives and anti-fouling paints, and ground and liquid paints, n.o.p., p.c.	15½	25	27½	25
Paints and colors, ground in spirits, and all spirit varnishes and lacquers, per gallon	$1.00	$1.00	$1.00	$1.12½
Varnishes, lacquers, japans, japan driers, liquid driers and oil finish, n.o.p., per gallon	15c	15c	15c	20c
And per cent.	15	20	22½	20
Paris green, dry, p.c.	5	7½	10	10
Gold liquid paint, p.c.	15	22½	25	25
Putty, of all kinds, p.c.	12½	17½	20	20
Linseed or flaxseed oil, raw or boiled, per 100 lbs.	80c	$1.10	$1.20	25p.c.
Turpentine, raw or crude	F	F	F	F
Turpentine, spirits of	5	5	5	5
Illuminating oils, composed wholly or in part of the products of petroleum, coal, shale, or lignite, costing more than 30c. per gal., p.c.	15	17½	20	20
Lubricating oils, composed wholly or in part of petroleum, costing less than 25c per gallon, per gallon	1½c	2¼c	2½c	2½c
Crude petroleum, gas oils, other than naptha, benzine and gasoline, lighter than .8235, but not less than .775 specific gravity, at 60 degrees temperature, per gallon	1c	1¼c	1½c	1½c
Oils, coal and kerosene, distilled, purified, or refined, petroleum, and products of petroleum, n.o.p., per gallon	1½c	2¼c	2½c	2½c
Gasoline or naphtha, under .775 specific gravity at 60 degrees temperature	F	F	F	F
Lubricating oils, n.o.p., and axle grease, per cent.	12½	17½	20	20

Group 7—Earths, Earthenware and Stoneware.

Fire brick, p.c.	5	7½	10	F
Building brick, paving brick, and manufactures of clay or cement, n.o.p., p.c.	12½	20	22½	20
Drain tiles, not glazed, p.c.	15	17½	20	20
Drain pipes, sewer pipes and earthenware fittings therefor, chimney linings or vents, chimney tops and inverted blocks, glazed or unglazed, earthenware tiles, n.o.p., p.c.	25	32½	35	35
Tiles or blocks of earthenware or of stone prepared for mosaic flooring, p.c.	20	27½	30	35
Closets, urinals, basins, lavatories, baths, bath tubs, sinks and laundry tubs of earthenware, stone, cement, or clay, or of other material, n.o.p., p.c.	20	30	35	30
Cement, Portland and hydraulic or water lime, in barrels, bags, or casks, the weight of the package to be included in the weight for duty, per 100 pounds	8c	11	12½	12½
Bags in which cement or lime mentioned in the next preceding item is imported, p.c.	15	20	20	20
Plaster of paris, or gypsum, calcined, and prepared wall plaster, the weight of the package to be included in the weight for duty, per 100 lbs.	8c	11c	12½c	12½c
Plaster of paris or gypsum, ground, not calcined, p.c.	10	12½	15	15
Clays, including china clay, fire clay and pipe clay not further manufactured than ground; ganister and sand; gravels; earths, crude only	F	F	F	F
Pumice, calcarous tufa, pumice stone and lava, not further manufactured than ground	F	F	F	F
Crucibles, clay or plumbago	F	F	F	F
Grindstones, not mounted, and not less than 36 inches in diameter, p.c.	10	12½	15	15
Grindstones, mounted or not, n.o.p. p.c.	17½	22½	25	25
Ashestos in any form other than crude, and all manufactures thereof, p.c.	15	22½	25	25
Plumbago, not ground or otherwise manufactured, p.c.	5	7½	10	10
Plumbago, ground, and manufactures of, n.o.p., and foundry facings of all kinds, p.c.	15	22½	25	25
Common and colorless window glass p.c.	7½	12½	15	15
Glass, in sheets and bent plate glass, n.o.p., p.c.	17½	22½	25	20
Plate glass, not beveled, in sheets or panes not exceeding seven square feet each, n.o.p., p.c.	7½	10	10	10
Plate glass, not beveled, in sheets or panes, exceeding seven square feet each and not exceeding twenty-five square feet each, n.o.p., p.c.	15	25	27½	25
Plate glass, n.o.p., p.c.	22½	30	35	35
Stained or ornamental glass windows, per cent.	20	27½	30	30
Glass demijohns or carboys, bottles, decanters, flasks, phials, glass jars and glass balls, lamp chimneys, glass shades or globes, cut, pressed or molded crystal or glass tableware, decorated or not, blown glass tableware, and manufactures of glass, n.o.p., p.c.	20	30	32½	30

Group 8—Metals and Manufactures Thereof.

Antimony, or regulus of, not ground, pulverized or otherwise manufactured	F	F	F	F
Bismuth, metallic, in its natural state	F	F	F	F

	British Pref.	Inter-mediate	General	Former Tariff
Cinnabar, quicksilver, radium	F	F	F	
Tea lead	F	F	F	F
Lead, old, scrap, pig and block, p.c.	10	15	15	15
Lead, in bars and in sheets, p.c.	15	22½	25	25
Lead, manufactures of, n.o.p., p.c.	20	27½	30	35
Babbitt metal and type metal, in blocks, bars, plates, and sheets, p.c.	10	15	15	10
Phosphor tin and phosphor bronze in blocks, bars, plates, sheets and wire, per cent.	5	7½	10	10
Tin in blocks, pigs, bars, plates, or sheets, tin strip waste, and tin foil	F	F	F	F
Japanned ware, tinware, and all manufactures of tin, n.o.p., p.c.	15	22½	25	25
Zinc dust, zinc spelter and zinc in blocks, pigs, bars, rods, sheets and plates, and seamless drawn tubing of zinc	F	F	F	F
Zinc, manufactures of, n.o.p., p.c.	15	22½	25	25
Brass and copper, old and scrap, or in blocks, ingots, or pigs, copper and bronze in bars and rods, in coil, or otherwise, not less than six feet in length, unmanufactured, copper in strips, sheets or plates, not polished, planished, or coated, brass or copper tubing, in lengths of not less than six feet, and not polished, bent, or otherwise manufactured	F	F	F	F
Brass, in bars and rods, in coil or otherwise, not less than six feet in length, and brass in strips, sheets, or plates, not polished, planished, or coated, p.c.	5	7½	10	F
Brass wire, plain, p.c.	7½	10	12½	10
Copper wire, plain, tinned, or plated, per cent.	7½	10	12½	10
Brass and copper nails, tacks, rivets and burrs or washers; bells and gongs, n.o.p., and manufactures of brass or copper, n.o.p., p.c.	20	27½	30	30
Aluminum ingots, blocks, bars, rods, strips, sheets or plates; aluminum tubing in lengths not less than six feet, not polished, bent or otherwise manufactured	F	F	F	F
Manufactures of aluminum, n.o.p., p.c.	15	22½	25	25
Britannia metal, nickel silver, Nevada and German silver, manufactures of, not plated, n.o.p., p.c.	17½	27½	30	25
Gold, silver, and aluminum leaf; Dutch or Schlag metal leaf; brocade and bronze powder	15	25	27½	25
Articles consisting wholly or in part of sterling or other silverware, nickel-plated ware, gilt or electro-plated ware, n.o.p., manufactures of gold and silver, n.o.p., p.c.	22½	30	35	30
Platinum wire and platinum in bars, strips, sheets or plates	F	F	F	F
Clocks, watches, time recorders, watch glasses, clock and watch keys, clock cases and clock movements, p.c.	20	27½	30	25
Chronometers and compasses for ships	F	F	F	F
Blast furnace slag	F	F	F	F
Scrap iron and scrap steel, old and fit only to be remanufactured, being part of or recovered from any vessel wrecked in waters subject to the jurisdiction of Canada	F	F	F	F
Iron or steel scrap, wrought, being waste or refuse, including punchings, cuttings or clippings or iron or steel plates or sheets having been in actual use; crop ends of tie plate bars, or of blooms, or of rails, the same not having been in actual use, per ton	70c	90c	$1.00	$1.00
But nothing shall be deemed scrap iron or scrap steel except waste or refuse iron or steel fit only to be remanufactured in rolling mills or furnaces, provided that articles of iron or steel, damaged in transit, if broken up under Customs supervision and rendered unsaleable except as scrap, may be entered for duty as scrap.				

	British Pref.	Inter-mediate	General	Former Tariff
Iron in pigs, iron kentledge, and cast scrap iron, farro-silicon, ferro-manganese, and spiegeleisen, per ton	$1.50	$2.25	$2.50	$2.50
Iron or steel billets, weighing not less than sixty pounds per lineal yard; ingots, cogged ingots, blooms, slabs, puddled bars, and loops or other forms, n.o.p., less finished than iron or steel bars, but more advanced than pig iron, except castings, per ton	$1.75	$2.50	$2.75	$2.75
Rolled iron or steel angles, tees, beams, channels, girders and other rolled shapes or sections, not punched, drilled, or further manufactured than rolled, per ton	$4.25	$6.00	$7.00	$7.00
Bar iron or steel, rolled, whether in coils, rods, bars or bundles, comprising rounds, ovals, and squares and flats; steel billets, n.o.p., and rolled iron or steel hoop, band, scroll, or strip, twelve inches or less in width, number thirteen gauge and thicker, n.o.p., per ton	$4.25	$6.00	$7.00	$7.00
Rolled iron or steel beams, channels and angle-bars, weighing not less than forty pounds per lineal yard, and universal mill or rolled edge plates of steel, over twelve inches wide, for use in the manufacture of bridges, when imported by manufacturers of bridges, p.c.	5	10	10	10
Rolled iron or steel plates, not less than thirty inches in width, and not less than one-quarter of an inch in thickness, when imported by manufacturers of boilers for use in the manufacture of boilers, p.c.	5	10	10	10
Rolled iron or steel plates, not less than forty-eight inches in width and exceeding one-half inch in thickness, n.o.p., p.c.	5	10	10	10
Rolled iron or steel sheets or plates, sheared or unsheared, and skelp iron or steel, sheared or rolled in grooves, n.o.p., per ton	$4.25	$6.00	$7.00	$7.00
Skelp iron or steel, sheared or rolled in grooves, when imported by manufacturers, or wrought iron or steel pipe for use only in the manufacture of wrought iron or steel pipe in their own factories, p.c.	5	5	5	5
Rolled iron or steel sheets, number thirteen gauge and thinner, n.o.p., Canada plates, Russia iron, flat galvanized iron or steel sheets; terne plate and rolled sheets of iron or steel, coated with zinc, spelter or other metal, of all widths or thicknesses, n.o.p., and rolled iron or steel hoop, band, scroll, or strip, number fourteen gauge and thinner, galvanized or coated with other metal or not, n.o.p., p.c.	F	5	5	F
Chrome steel, p.c.	10	12½	15	15
Rolled iron or steel, bars, bands, hoops, scroll or strip, sheet or plate, of any size, thickness, or with galvanized or coated with any material or not, and cast steel when of greater value than three and a half cents per pound, n.o.p., p.c.	F	5	5	5
Swedish rolled iron and Swedish rolled steel nail rods, under half an inch in diameter, for the manufacture of horse-shoe nails, p.c.	10	12½	15	15
Iron and steel railway bars or rails of any form, punched or not, n.o.p., for railways, which term for the purposes of this item shall include all kinds of railways and tramways, even although they are used for private purposes only, and even although they are not used or intended to be used in connection with the business of common carrying of goods or passengers, per ton	$4.50	$6.00	$7.00	30p.c.

	British Pref.	Intermediate	General	Former Tariff
Iron or steel railway bars or rails, which have been in use in the tracks or railways in Canada and which have been exported from Canada and returned thereto after having been re-rolled, and weighing not less than fifty-six pounds per lineal yard when re-rolled, and which are to be used by the railway company importing them on their own tracks under regulations prescribed by the Minister of Customs, p.c.	25	25	25	25
Provided that the value for duty of such re-rolled rails shall be the cost of re-rolling the same. Provided also that whenever the Governor-in-Council is satisfied that a mill adapted and equipped for re-rolling such rails in substantial quantities has been established in Canada, the Governor-in-Council may by order-in-council to be published in the Canada Gazette abolish the duty specified in this item, and thereupon all such rails when imported shall be subject to such duty as otherwise provided in the Customs tariff.				
Railway fish and plates and tie plates, per ton	$5.00	$7.00	$8.00	$8.00
Switches, frogs, crossings, and intersections for railways, p.c.	20	30	32½	30
Iron or steel bridges or parts thereof, iron or steel structural work, columns, shapes or sections, drilled, punched or in any further state of manufacture than as rolled or cast, n.o.p., p.c.	22½	30	35	35
Springs, axles, axle bars, n.o.p., and axle blanks, and parts thereof, of iron or steel, for railway, tramway, or other vehicles, p.c.	22½	30	35	35
Forgings of iron or steel of whatever shape or size, or in whatever stage of manufacture, n.o.p., and steel shafting, turned, compressed, or polished, and hammered, drawn, or cold rolled iron or steel bars or shapes, n.o.p., p.c.	20	27½	30	30
Cast iron pipe of every description, per ton	$6.00	$7.00	$8.00	$8.00
Wrought or seamless iron or steel tubes for boilers, n.o.p., under regulations prescribed by the Minister of Customs, flues and corrugated tubes for marine boilers, p.c.	F	5	5	5
Seamless steel tubing valued at not less than 3½c per lb., rolled or drawn square tubing of iron or steel adapted for use in the manufacture of agricultural implements, p.c.	F	5	5	5
Tubes of rolled iron or steel, not joined or welded, not more than one half-inch in diameter, n.o.p., p.c.	5	7½	10	10
Wrought or seamless iron or steel tubing, plain or galvanized, threaded and coupled or not, over 4 inches in diameter, n.o.p., p.c.	10	12½	15	15
Wrought or seamless iron or steel tubing, plain or galvanized, threaded and coupled or not, 4 inches or less in diameter, n.o.p., p.c.	20	30	35	35
Iron or steel pipe or tubing, plain or galvanized, riveted, corrugated, or otherwise specially manufactured, including lock joint pipe, n.o.p., p.c.	20	27½	30	30
Wire-bound wooden pipe, p.c.	15	22½	25	25
Iron or steel fittings, for iron or steel pipe, of every description, p.c.	20	27½	30	30
Wire, crucible, cast steel, valued at not less than 6c per lb., p.c.	F	5	5	5
Galvanized iron or steel wire, Nos. 9, 12 and 13 gauge, p.c.	F	5	5	5
Buckthorn strip fencing, woven wire fencing, and wire fencing of iron or steel, n.o.p., not to include woven wire or netting made from wire smaller than No. 14 gauge, nor to include fencing of wire larger than No. 9 gauge, p.c.	10	12½	15	F
Wire of all metals and kinds, n.o.p., per cent.	15	17½	20	20
Wire, single or several, covered with cotton, linen, silk, rubber or other material, including cable so covered, n.o.p., p.c.	20	27½	30	30
Wire rope, stranded or twisted wire, clothes lines, picture, or other twisted wire, and wire cable, n.o.p., p.c.	17½	22½	25	25
Wire cloth or woven wire and wire netting of iron or steel, p.c.	20	27½	30	25
Coil chain, coil chain links, and chain shackles, of iron or steel, five-sixteenths of an inch in diameter and over, p.c.	5	5	5	5
Iron or steel nuts, washers, rivets, and bolts, with or without threads, nut bolt and hinge blanks, and T and strap hinges of all kinds, n.o.p., per 100 lbs.	75c	75c	75c	75c
And per cent.	10	20	25	25
Screws, commonly called "wood screws," or iron or steel, brass or other metal, including lag or coach screws, plated or not, and machine or other screws, n.o.p., p.c.	22½	30	35	35
Iron or steel cut nails and spikes (ordinary builder's), and railroad spikes, per 100 lbs.	30c	45c	50c	50c
Composition nails and spikes, and sheathing nails, p.c.	10	12½	15	15
Wire nails of all kinds, n.o.p., per 100 lbs.	40c	55c	60c	60c
Nails, brads, spikes and tacks of all kinds, n.o.p., p.c.	20	30	35	30
Wire cloth, or woven wire of brass or copper, p.c.	17½	22½	25	25
Iron or steel hollow ware, plain black, tinned or coated, n.o.p., and nickel and aluminum kitchen or household hollow-ware, n.o.p., p.c.	20	27½	30	30
Lamp springs, p.c.	7½	10	10	10
Lamps, side lights and head lights, lanterns, chandeliers, gas, coal oil, or other lighting fixtures, including electric light fixtures, or metal parts thereof, lava or other tips, burners, collars, galleries, shades, and shade holders, p.c.	20	27½	30	20
Gas meters and finished parts thereof, per cent.	22½	30	35	35
Fire engines and fire extinguishing machines, including sprinklers for fire protection, p.c.	22½	30	35	35
Threshing machine outfit, when consisting of traction or portable engine and separator, p.c.	15	17½	20	25
Hay loaders, potato diggers, horse powers, separators, n.o.p.; wind stackers, fodder or feed cutters, grain crushers, fanning mills, hay tedders, farm, road, or field rollers, post-hole diggers, snaths, and other agricultural implements, n.o.p., p.c.	15	22½	25	25
Shovels and spades, iron or steel, n.o.p.; shovel and spade blanks, and iron or steel cut to shape for the same, and lawn mowers, p.c.	20	30	32½	35
Stoves of all kinds, for coal, wood, oil, spirits, or gas, p.c.	15	22½	25	25
Belt pulleys of all kinds for power transmission, p.c.	15	25	27½	25
Telephone and telegraph instruments, electric and galvanic batteries, electric motors, dynamos, generators, sockets, insulators of all kinds, electric apparatus, n.o.p.; boilers, n.o.p.; and all machinery composed wholly or in part of iron or steel, n.o.p.; and integral parts of all machinery specified in this item, p.c.	15	25	27½	25
Manufactures, articles or wares of iron or steel, or of which iron and steel, or either, are the component materials				

	British Pref.	Inter-mediate	General	Former Tariff
of chief value, n.o.p., p.c.	20	27½	30	30
Anchors for vessels	F	F	F	F
Ingot molds, glass molds of metal, p.c.	5	7½	10	F
Iron sand or globules or iron shot and dry putty, adapted for polishing glass or granite, or for sawing stone	F	F	F	F
Steel bowls for cream separators and cream separators	F	F	F	F
Sundry articles of metal, as follows, when for use exclusively in mining or metallurgical operations, viz.: diamond drills, not including the motive power, coal-cutting machines, except percussion coal cutters, coal heading machines, coal augers, rotary coal drills, core drills, miners' safety lamps and parts thereof; also accessories for cleaning, filling and testing such lamps, electric or magnetic machines for separating or concentration iron ores, blast furnaces for the smelting of copper and nickels, converting apparatus for metallurgical processes in iron or copper; copper plates, plated or not, machinery for extraction of precious metals by the chlorination or cyanide processes; amalgam safes, automatic ore samplers, automatic feeders, retorts, mercury pumps, prometers, bullion furnaces, amalgam cleaners, blast furnace blowing engines, wrought iron tubing, butt or lap welded, threaded or coupled or not, over four inches in diameter, and integral parts of all machinery mentioned in this item	F	F	F	F
Machinery of a class or kind not made in Canada, for the manufacture of twine, cordage, or linen, or for the preparation of flax fibre	F	F	F	F
Well-drilling machinery and apparatus for boring and drilling for water	F	F	F	F
Iron or steel masts, or parts thereof, and iron or steel beams, angles, sheets, plates, knees, and cable chain, for wooden, iron, steel, composite ships and vessels, and iron, steel, or brass manufactures which at the time of their importation are of a class or kind not manufactured in Canada, when imported for use in the construction or equipment of ships or vessels under regulations prescribed by the Minister of Customs	F	F	F	F
Rolled round wire rods in the coil of iron or steel, not over three-eighths of an inch in diameter, when imported by wire manufacturers for use in making wire in the coil in their own factories	F	F	F	F
Materials under which enter into construction and form part of cream separators, when imported by manufacturers of cream separators to be used in their own factories for the manufacture of cream separators	F	F	F	F
Rolled steel for saws and for straw cutters, not tempered or ground, nor further manufactured than cut to shapes, without indented edges	F	F	F	F
Crucible sheet steel, eleven to sixteen gauge, 2½ to 18 inches wide, for the manufacture of mower and reaper knives, when imported by the manufacturers thereof for use exclusively in the manufacture of such articles in their own factories	F	F	F	F
Steel strip and flat steel wire, when imported into Canada by manufacturers of buckhorn and plain strip fencing for use exclusively in the manufacture of such articles in their own factories; and barbed fencing wire of iron or steel	F	F	F	F
Steel wire, Bessemer soft drawn spring of Nos. 10, 12, and 13 gauge, respectively, and home steel spring wire of Nos. 11 and 12 gauge, respectively, when imported by manufacturers of wire mattresses, to be used exclusively in the manufacture of such articles in their own factories	F	F	F	F
Cups, brass, being rough blanks for the manufacture of paper shells or cartridges, when imported by manufacturers of brass and paper shells and cartridges, for use exclusively in the manufacture of such articles in their own factories	F	F	F	F
Brass caps adapted for use in the manufacture of electric batteries	F	F	F	F
Iron tubing, lacquered or brass covered, not over two inches in diameter, and brass trimmings when imported by manufacturers of iron or brass bedsteads, for use exclusively in the manufacture of such articles in their own factories	F	F	F	F
Platinum crucibles	F	F	F	F
Platinum retorts, pans, condensers, tubing and pipe, and preparations of platinum, when imported by manufacturers of sulphuric acid, for use exclusively in the manufacture or concentration of sulphuric acid in their own factories	F	F	F	F
Steel balls, adapted for use on bearings of machinery and vehicles, p.c.	F	7½	10	10
Steel wood, p.c.	5	7½	10	10
Group 9—Wood and Manufactures Thereof.				
House, office, cabinet or store furniture, of wood, iron or other material, in parts or finished; wire screens, wire doors and wire windows; cash registers; window cornices and cornice poles of all kinds; hair, spring and other mattresses; curtain stretchers; furniture springs and carpet sweepers, per cent.	20	27½	30	30
Group 10—Cotton, Flax, Hemp, Jute and Other Fibres.				
Hemp, dressed or undressed	F	F	F	F
Oakum or jute or hemp	F	F	F	F
Twine and cordage of all kinds, n.o.p., per cent.	20	22½	25	25
Sails for boats and ships, p.c.	15	22½	25	25
Lamp wicks, p.c.	17½	22½	25	25
Mats, door or carriage, other than metal, n.o.p., p.c.	25	30	35	35
Group 11—Miscellaneous.				
Asphalt or asphaltum solid; bone pitch, crude only; and resin or resin in packages of not less than 100 lbs.	F	F	F	F
Coal and pitch pine, Burgundy pitch; and coal and pine tar crude in packages of not less than fifteen gallons	F	F	F	F
Coal, anthracite; anthracite coal dust; coke	F	F	F	F
Bituminous slack coal; such as will pass through a ¾-inch screen, subject to regulations prescribed by the Minister of Customs, per ton	10c	12c	14c	15c
Bituminous round and run of mine, and coal, n.o.p.; per ton	35c	45c	53c	53c
Freight wagons, farm wagons, drays and sleighs, p.c.	17½	22½	25	25
Buggies, carriages, pleasure carts and vehicles, n.o.p., including automobiles and motor vehicles of all kinds; tires of rubber for vehicles of all kinds, fitted or not; cutters, children's carriages and sleds, and finished parts of all articles in this item, n.o.p., p.c. Provided that for duty purposes the minimum value of an open buggy shall be $40, and the minimum value of a covered buggy shall be $50.	22½	30	35	35
Railway cars or other cars, wheel-barrows, trucks, road or railway scrapers, and hand carts, p.c.	20	27½	30	30

	British Pref	Inter-mediate	General	Former Tariff
Bicycles and tricycles, n.o.p., p.c.	20	27½	30	30
Hides and skins, raw, whether dry, salted or pickled, and raw pelts	F	F	F	F
Fur tails, in the raw state	F	F	F	F
Fur skins of all kinds, not dressed in any manner	F	F	F	F
Belting, of leather, p.c.	12½	17	20	20
Belting, n.o.p., p.c.	20	25	27½	25
Harness and saddlery, including horse boots, p.c.	20	27½	30	30
Rubber cement, and all manufactures of India rubber and gutta percha, n.o.p., per cent.	15	25	27½	25
India rubber clothing, and clothing made waterproof with India rubber or gutta percha hose, and cotton or linen hose lined with rubber; rubber mats or matting and rubber packing, p.c.	22½	30	35	35
Gloves and mitts, of all kinds, p.c.	22½	30	35	35
Clothes wringers for domestic use, and parts thereof, p.c.	22½	30	35	35
Signs of any material other than paper, framed or not, letters and numerals of any material other than paper, p.c.	20	27½	30	30
Glycerine, when imported by manufacturers of explosives, for exclusively in the manufacture of such articles in their own factories	F	F	F	10
Nitro glycerine, giant powder, nitro and other explosives, n.o.p., per lb.	1¾c	2¼c	2½c	3c
Blasting and mining powder, per lb.	1 1-3c	1¾c	2c	2c
Cannon, musket, rifle, gun and sporting powder and cannister powder, per lb.	2c	2¾c	3c	3c
Emery, in bulk, crushed or ground	F	F	F	F
Emery wheels, carborundum wheels and manufactures of emery or of carborundum, p.c.	17½	22½	25	25
Junk, old; rags of cotton, linen, jute, hemp and wool; paper waste clippings, and waste of all kinds, n.o.p., except metallic; broken glass, or glass cullet	F	F	F	F
Fish hooks, for deep sea or lake fishing, not smaller in size than number 2.0; bank, cod, pollock and mackerel, fish lines; and mackerel, herring, salmon, seal, seine, mullet, net and trawl twine in hanks or coil, barbed or not, in variety of sizes and threads, including gilling thread in balls, and head ropes for fishing nets; manilla rope for holding traps in the lobster fishery; barked marline, and net morsels of cotton, hemp or flax; and deep-sea fishing nets or seines, when used exclusively for the fisheries, not to include hooks, lines or nets commonly used for sportsmen's purposes	F	F	F	F
Coverings, inside and outside, used in covering or holding goods imported therewith, shall be subject to the following provision, viz.—				
(a) Usual coverings containing free goods only; usual coverings, except receptacles capable of holding liquids, containing goods subject to a specific duty only, n.o.p.	F	F	F	F
(b) Usual covering containing goods subject to any ad valorem duty when not included in the invoice value of the goods they contain, p.c.	15	20	20	
(c) Provided that usual coverings containing goods subject to any ad valorem duty if included in the invoice value of the goods they contain, and not charged separately on the invoice, shall be subject to the same rate of duty ad valorem as the goods they contain, and may be combined with the goods for valuation and duty on the customs entry.				
(d) Provided further that receptacles capable of holding liquids, when containing goods, subject to a specific duty, shall be charged with the rate of duty to which the same would be subject if imported separately, except when the coverings and the goods contained therein are rated together in the tariff item;				
(e) Provided further that usual coverings designed for use other than in the bona fide transportation of the goods they contain, shall be charged with the rate of duty to which the same would be subject if imported separately;				
(f) Provided also that the term covering in this paragraph shall include packing boxes, crates, casks, cases, cartons, wrapping, sacks, bagging, rope, twine, straw or other articles used in covering or holding goods imported therewith, and the labor and charges for packing such goods, subject to regulations prescribed by the Minister of Customs;				
All goods not enumerated in this act as subject to any other rate of duty nor declared free of duty by this act, and not being goods the importation whereof is by this act or any other act prohibited, p.c.	15	17½	20	

Schedule B—Goods Subject to Drawback for Home Consumption.

	Drawback
Oil fuel and other articles, not machinery—when entering into the cost of binder twine manufactured in Canada	95 p.c.
Rolled iron, rolled steel and pig iron—when used in the manufacture of mowing machines, reapers, harvesters, binders, and attachments for binders	95 p.c.
Hemp bleaching compound—when used in the manufacture of rope	95 p.c.
Steel under one-half inch in dinmeter or under one half inch square—when used in the manufacture of locks and knobs	95 p.c.
Steel cut to shape—when used in the manufacture of spoons	95 p.c.
Flat spring steel, steel billets and steel axle bars—when used in the manufacture of springs and axles for vehicles other than railway or tramway vehicles	95 p.c.
Spiral spring steel—when used in the manufacture of railway spiral springs	95 p.c.
Steel—when used in the manufacture of cutlery, files, augers, auger bits, hammers, axes, hatchets, scythes, reaping hooks, hoes, hay or straw knives, agricultural forks, hand rakes, skates, stove trimmings, bicycle chain and windmills	95 p.c.

PROHIBITED GOODS.

Goods manufactured or produced wholly or in part by prison labor, or which have been made within or in connection with any prison, jail or penitentiary, also goods similar in character to those produced in such institutions, when sold or offered for sale by any person, firm or corporation having a contract for the manufacture of such articles in such institutions, or by any agent of such person, firm or corporation, or when such goods were originally purchased from or transferred by any such contractor.

Metallic trading checks.

Any goods (a) which, if sold would be forfeited under the provisions of part of the Criminal Code; or (b) manufactured in any foreign state or country which bear any name or trade mark which is or purports to be the name or trade mark of any manufacturer, dealer or trader in the United Kingdom or in Canada, unless such name or trade mark is accompanied by a definite indication of the foreign state or country in which the goods were made or produced. Provided, that for the purposes of this item, if there is on any goods a name which is identical with or a colorable imitation of the name of a place in the United Kingdom or in Canada, such name, unless it is accompanied by the name of the state or country in which it is situate, shall, unless the Minister decides that the attaching of such name is not calculated to deceive (of which matter the Minister shall be the sole judge), be treated as if it was the name of a place in the United Kingdom or in Canada.

Iron and Steel Bounties.

Mr. Fielding's resolution on iron and steel bounties is as follows:

Resolved: (1) That it is expedient to repeal chapter 8 of the statutes of 1899 and chapter 60 of the statutes of 1903, from and after the 1st January, 1907.

(2) That it is expedient to provide that the Governor in Council may authorize the payment from the consolidated revenue fund of the following bounties on the under-mentioned articles manufactured in Canada for consumption therein, viz:

(a) In respect of pig iron manufactured from ore, on the proportion from Canadian ores produced during the calendar years — 1907, $2.10 per ton; 1908, $2.10 per ton; 1909, $1.70 per ton; 1910, 90c per ton.

(b) In respect of pig iron manufactured from ore on the proportion from foreign ores produced during the calendar years — 1907, $1.10 per ton; 1908, $1.10 per ton; 1909, 70c per ton; 1910, 10c per ton.

(c) On puddled iron bars manufactured from pig iron made in Canada, during the calendar years—1907, $1.65 per ton; 1908, $1.65 per ton; 1909, $1.05 per ton; 1910, 60c per ton.

(d) In respect of rolled round wire rods not over three-eighths of an inch in diameter, manufactured in Canada from steel produced in Canada from ingredients of which not less than fifty per cent. of the weight thereof consists of pig iron made in Canada, when sold to wire manufacturers for use in making wire in their own factories in Canada, on such wire rods made after the 31st December, 1906, $6 per ton.

(e) In respect of steel ingots manufactured from ingredients of which not less than 50 per cent. of the weight thereof consists of pig iron made in Canada, on such ingots made during the calendar years—1907, $1.65 per ton; 1908, $1.65 per ton; 1909, $1.05 per ton; 1910, 60c per ton. Provided that bounty shall not be paid on steel ingots from which steel blooms and billets for exportation from Canada are manufactured.

(3) That it is expedient to provide that the Governor in Council may make regulations to carry out the intentions of these resolutions.

(4) That it is expedient to provide that the Minister of Trade and Commerce shall be charged with the administration of the foregoing provisions.

OPINIONS ON THE NEW TARIFF

Canadian Fairbanks Co.

H. J. Fuller, whose views were incorrectly reported by a Montreal evening paper, has given his views on the recent changes in the tariff as follows:

(1) That I believe that the giving of the preferential tariff in favor of Great Britain is an entirely proper policy on the part of the Government; that Canada should buy, as far as possible, her surplus requirements from Great Britain.

(2) That however, the minimum tariff should at least be an equalizing tariff or, in other words, that the Canadian manufacturer should have at least an equal opportunity with the British manufacturer to supply the Canadian market.

(3) I do not believe that the tariff of 15 per cent. on machinery is fair protection to the Canadian manufacturer of these lines when the lower cost of labor, material, and the advantageous through freight rates are taken into consideration; to say nothing of the comparatively limited quantities in which he is able to manufacture.

(4) I believe that the increase in the duty to 27½ per cent. against American machinery is excessive, and that the many American manufacturers who have invested millions in their plants in Canada are entitled to at least some consideration when they are of necessity compelled to import from their affiliated plants in the United States some sizes and styles of machines which the present comparatively limited market in Canada does not enable them to make here.

It was in reference to this that I made mention of a number of Canadian-American concerns located here

Ship Building Interests.

Speaking of the new tariff, as affecting the shipbuilding interests of Canada, Frederic Nicholls, managing director of the Canadian General Electric Co., stated that the disabilities of the industry have been fully explained to the Finance Minister from time to time and all connected with it thought it would receive favorable consideration at his hands. The reason for this consideration being asked, is that there is no other such anomally existing throughout the entire Canadian tariff.

"Those of us who are manufacturing ships have to pay duty on nearly all the material that enters into the manufacture. For instance, if we manufacture engines, boilers or other accessories, we have to pay duty on raw materials and again, if we import finished engines or boilers we also have to pay duty.

"The same applies to everything included in fittings and furnishings, such as furniture, tableware, cutlery, glassware, and in fact, every detail of a ship. On the other hand, if a ship is imported from Great Britain, with furnishings complete it is allowed to enter Canada absolutely free of duty.

"We are hoping that this matter will receive separate and special consideration at the hands of the Finance Minister of the Government.

Forge Company's Opinion.

A manufacturing company in Canada whose principal business is the making of forgings giving its opinion states: "We are seriously affected by item 379 wherein the tariff on steel billets and blooms was raised 75c per ton. All our forgings or practically all are made from this material; therefore this change will not be conducive to lower priced forgings inasmuch as the other manufacturers in Canada, without exception, are affected as seriously as we are, including the steel mills that make the manufacture of forgings a side issue."

Assists Gasoline Engine Makers.

J. R. Golden, general manager and secretary of the Canadian McVicker Engine Co., Galt Ont., states that now gasoline is placed on the free list it will be a great help to them in the manufacture of gasoline engines. Other changes do not affect them in any way.

Tariff Satisfactory.

The R. McDougall Co., of Galt, considers the changes in the new tariff on the whole satisfactory, as they would not expect the changes to be altogether in their favor.

Reacts Against Incandescent Lights.

R. B. Hamilton, managing director and the Packard Electric Co., St. Catharines, takes exception to the heavy increase on the duty on glass bulbs for incandescent lamps. He states that the changes which affect them principally are the placing of 10 per cent. duty on brass rods and sheets and the omission of any reference to specific items, such as iron castings in the rough, glass bulbs for incandescent lamps, etc. In the matter of the duty on brass, would explain that this was included in the tariff at the express request of a concern, which is at present not operating and which, at its best, could not begin to supply the requirements of Canadian users of these materials. The net result will, therefore, be a very heavy increase of expense to a large number of manufacturers. Were it possible to secure this material in satisfactory quality and quantities in Canada the manufacturers would probably have little, if any exception, to this item on the tariff. Under the circumstances, therefore it is causing a great deal of criticism.

Iron castings in the rough have heretofore been specifically rated at 25 per cent. In the new tariff they are not mentioned, and are, therefore, included in "Iron N.O.P. at 30 per cent.," which makes these raw materials dutiable at as high a rate as finished products.

The duty on glass bulbs for incandescent lamps was specifically placed at 10 per cent. under the old tariff, but no mention is now made of the item which, therefore, falls under the classification "Glass N.O.P." at 32½ per cent. This is a very serious matter to manufacturers of incandescent lamps, as the breakage and waste in this material is so great as to multiply the percentage of duty several times over. The change is therefore, placing Canadian manufacturers under a great burden, and with no corresponding benefit to any one, as the bulbs are not made in Canada, and could not be made here, since the market is not nearly sufficient to warrant the establishment of the extremely expensive plant required. Aside from these and a few other items of lesser importance to us, we have no criticism to offer on the new tariff.

Not Much Change.

H. W. Dorken of Dorken Bros. & Co., hardware importers, Montreal, when seen by a Hardware and Metal representative, remarked that, in his opinion, the Government had carried out a good policy in refusing to make any very radical changes in the tariff. So far as he had studied the tariff, although a few articles showed a higher duty, and some others a lower than before, conditions were practically the same. In most cases, the change did not amount to more than about 2½ per cent., which would not hurt anybody. "I was not pleased" said Mr. Dorken, "to see the German surtax retained, after its three years trial. Ours is almost entirely a German business, and our goods will still be subject to the additional duty, which, we had expected, would be removed. On the whole, however, the Government has done well, and has made an effort to adopt a tariff with as few clauses as possible, which will benefit the masses and not the few."

Paint Manufacturers' Object.

A. Ramsay, of the A. Ramsay & Son Co., did not care to express himself at any length, but said briefly: "The new provision for duties on linseed oil, seems to give a fairly good preference to England. The new tariff will not be satisfactory to paint manufacturers, as manufactured goods are not sufficiently protected to cover cost of raw material."

Brandram-Henderson thought that the Canadian linseed oil industry would be better protected under the proposed specific duty than when the old ad valorem duty was in force. Under the old conditions, the Canadian mills had to shut down, whenever prices in England went down very low. As Brandram-Henderson will have their own lead corroding plant in Montreal, by next Spring, they are not so hard hit by the failure to raise duties on paints, as are other firms.

Wise Action on Tin Plate.

W. E. Ramsay, manager of the Pedlar People's Montreal branch, said: "In framing this tariff, the Government have gone into the matter pretty thoroughly, and have done what they thought in the best interests of all, showing undue favors to none. Of course, there are errors and omissions in the original draft, which, if brought before the Minister in a clear comprehensive and unselfish manner, will be remedied. The Commission did well to listen to the appeals and petitions of the farmers, business men and manufacturers, against the imposition of a 33 1-3 per cent. duty on tinned, galvanized and black sheets. It would be most unwise to furnish employment for even 400 men, and tax seven millions to do so.

Fire Brick Duty a Mistake.

Mr. King, manager of F. Hyde & Co., dealers in cement and firebricks, was asked what effect the duty on fire brick would have. He answered that it would be a serious matter to the large iron and steel manufacturers, who yearly use several millions' of firebricks. "I think this duty is a mistake, and I do not understand why the Government have done it. It may have been because some dealers have been bringing in pressed brick from the United States, and entering it as fire brick, but, if so, these dealers will be punished at the expense of the manufacturers."

No Complaint to Make.

S. Brewer, secretary of the Thos. Robertson & Co., dealers in steamfitters' supplies and metals, said: "Taking it all in all, the tariff is very satisfactory. Of course, there are a few items which might be adjusted, but we realize that it would be impossible to frame a tariff which would suit everybody, and we ourselves have no serious complaints to make.

Mr. Howland Criticises Tariff.

"I am opposed to the new tariff for several reasons," said Peleg Howland, pres. of the Toronto Board of Trade, and head of the H. S. Howland & Sons Co., wholesale hardware firm. "I am not a believer in more than one tariff nor do I approve of the bonus system or the anti-dumping clause."

"The refusal of the Government to protect the tin-plate industry by a duty, should have been accompanied by a refusal to continue to bonus the iron and steel industries. The inconsistency of their position is shown by their bonusing the pig iron industry, and then granting a drawback of 95 per cent on pig iron imported by the farm implement manufacturers, thus cutting out the market for the furnaces. Why, too, make fish of one set of manufacturers and flesh of another? If any rebates are to be given, why not give to all? Why should wire manufacturers and foundrymen be treated differently to implement manufacturers? As a matter of fact the application of the new tariff practically puts wire manufacturers in the hands of the Canadian monoply and higher prices are certain to result.

"I cannot conceive that the makers of the tariff realize the working out of the anti-dumping clause, as a higher duty would bring more revenue and greatly lessen the temptation to beat the customs. The extra charge made by the anti-dumping clause is only paid once or twice, after which it will be retained by the foreign importer or given by him to his customer as commissions, etc. How can honest importers continue to pay the advance, when dishonest men arrange for commissions or other special inducements from manufacturers, with no possibility of discovery. The anti-dumping clause is merely a method of deceiving the public, and its more stringent application by giving the Finance Minister power to disontinue the 5 per cent leeway means a concealed increase of protection to Canadian manufacturers without increase of revenue.

"The new tariff will have the effect of increasing the prices on many such lines, as shaving brushes, lead pencils, etc., as well as the changes which are generally known.

Cheap Metals in Sight.

George T. Pepall, of M. & L. Samuel, Benjamin & Co., Toronto, considered that the general effect of the new tariff would be to benefit British industries, and that outside of iron and steel bars and tank plates metals would be very cheap in Canada in the future. He thought it was peculiar that the Government should single out brass rods, etc., as a dutiable article while copper was left free, especially as there is at present no working industry in Canada to be benefitted by the change.

Severe Blow to Merchants.

Ferg. McDonald, manager of the metal department of Rice Lewis & Son, Toronto, points out that the new tariff is decidedly unfair to metal merchants especially in the item of boiler plate which was formerly dutiable at 10 per cent. on 30 inch wide and over while now it is $7.00 per ton when bought by merchants, while boiler merchants can get it at the same old rate. The tendency of this change will be to take the business entirely out of the hands of the metal merchants as boiler manufacturers will buy their tubes and other supplies from the same source as they secure their boiler plates from, and as small boiler makers and repair men cannot import in large quantities and will be unable to buy from merchants to advantage under the new conditions they must go out of business and all the trade will fall into the hands of large boiler manufacturers. The same thing applies to the bridge making industry owing to the changes in duty on beams, angles, channels, etc. These articles are universally used building material and as they are not made in Canada it is peculiar that a duty should be imposed on them to the detriment of the building trade.

Little Change in Glass.

W. R. Hobbs of the Consolidated Plate Glass Co., Toronto, considers that the new tariff will have little effect in the glass trade so far as the demand from the hardware and builders is concerned. Common sheet glass and smaller sizes of plate are left unchanged and the only new addition is that British manufacturers secure a slight additional advantage on some lines of plates.

Tin Plate Agents Pleased.

Arthur J. Owen, Canadian manager of Franklin Saunders & Co., manufacturers of tin plate, etc., expressed himself as follows: "I have nothing to say against the new tariff. Had the proposed duty been placed on tin plate, it would have worked most adversely against tin can manufacturers and other users of tin plates, black sheets, etc. It is a matter of congratulation both for manufacturers and dealers interested in importing such materials from the Old Country that not only was no heavy duty imposed, but such duty as has existed was taken off so as to encourage British industries.

The Package Problem.

Alexander Gibb, metal and hardware importer, Montreal, said: "I am very well satisfied, so far as I understand the new tariff. Regarding packages, the tariff is not plain. Galvanized iron coming from Great Britain, is on the free list. Will there be a duty on the cases? Some people seem to think there will be, and this is about the only thing that is worrying the hardware trade. English hardware dealers are always in the habit of charging for cases, which are free from most United States manufacturers. Thus, if a duty is imposed on the cases, as has been done in certain cases in the past, there will be a discrimination against Great Britain, which I do not think Mr. Fielding intended.

Paint Men Dissatisfied.

C. C. Ballantyne of the Sherwin-Williams Company, Montreal, said: "Paint manufacturers are not satisfied with the new tariff as applied to their products. When it was proposed, a year and a half ago, to increase the duty on white lead, the paint manufacturers informed the Government that they would offer no objection to assisting a new industry to establish itself, so long as it was understood that the Government would make a corresponding increase in the duty on mixed paints so that we should have as good protection as we had when the duty on white lead was 5, and on the finished article 25 per cent. When we presented our suggestions to the Minister, we asked that the tariff should be raised from 25 to 35 per cent. on mixed paints which would have the same effect as when the duty was 5 per cent. on lead, and 25 per cent. on mixed paints.

The paint industry was perfectly satisfied with things as they were before the duty on white lead was imposed. The old duty on white lead was 5 per cent, and on lead ground in oil, 25 per cent. Now, the duty on the raw material is 20 per cent., and on ground white lead, 25 per cent., a difference of only 5 per cent.

I think a good many people will regret that the difference between the maximum and intermediate tariff is not greater. It is only 2½ per cent., which is but a flea bite. It is not enough to make U.S. industries fell that they will have to come here to establish branches, if they want to do business.

Increased Cost of Brass Goods.

Chas. Morrison of the James Morrison Brass Manufacturing Co., Toronto, says that his company have not had time yet to consider the changes made in the new tariff but that the addition of the 10 per cent. duty on brass rods, tubes and sheets would increase their cost of manufacture to the extent of the duty as all rods and tubes used by them are over six feet in length. The advance on sheets will probably force an increase in prices although this will be difficult on account of the recent advances caused by the extraordinary high price of copper now ruling. Mr. Morrison stated that if the change would result in inducing the Brass Rolling Mills at New Toronto to re-open no objection could be made to the new duty, as the new industry would certainly be entitled to a measure of protection. At present, however, the advance would apply to imported goods only as no brass rods or sheets are produced in Canada.

Brass Mills to Re-open.

The Canadian Brass Rolling Mills will re-open their works at New Toronto in January said a representative of the company to Hardware & Metal on Wednesday. "We assured the Government that if we were given protection we would re-open the mills and we have already prepared the foundation for a large addition to the plant and have considerable new machinery on the grounds. We will be producing rods and sheets early in the New Year in accordance with our promise to the Government.

CORRESPONDENCE COLUMN

Some Explanation Needed.

In view of the fact that Mr. P. B. Ball, Dominion commercial agent at Birmingham, had complained of the quality of Canadian calcium carbide being shipped into England, the matter was brought to the attention of the readers of Canadian Machinery in the last issue. Since then letters have been received from each of the three manufacturers of calcium carbide in this country giving the situation from their view point. The letters would indicate that either Mr. Ball has been misinformed to some extent or else guilty of hasty action in denouncing the general quality of Canadian calcium carbide that was being shipped to England. The letters are given as received and speak for themselves.

* * *

Dear Sir:—

In your issue for December 1905, page 451, we find an article in reference to poor carbide having been delivered in Great Britain. We agree with the statements made in this article, that it is a serious matter for Canadian manufacturers to put an inferior grade of their product upon the British market, and beg to state that the carbide referred to was not manufactured or sold by this company. Our works, as you are aware, are located at Merritton, Ontario.

Yours truly,
Willson Carbide Company, Limited,
D. D. McTavish, Secretary-Treasurer.

* * *

Dear Sir:—

In your issue of December an article is published entitled "Poor Calcium Carbide" and the writer quotes a report of Mr. F. D. Ball, the Dominion commercial agent at Birmingham, which alleges that the poor quality of calcium carbide is systematically and continually shipped from Canada for the English markets.

With all due deference to the Dominion agent I would state that his information is incorrect and is probably based on casual complaint against some one particular shipment Mr. Ball in recommending the Canadian Manufacturers to look into this condition which he alleges in making the statement that the quality shipped for the English market is not up to the standard required, evidently considers that Canadian manufacturers of calcium carbide give no attention to the quality of goods manufactured.

In refuting the charges against the quality of Canadian carbide I would state that the company which I represent has been shipping carbide for the British market for over two years and the fact that our sales during the present year were only limited to our capacity and the limitations of ocean transportation is somewhat o .an indication that the carbide supplied is of the required quality.

This company has been selling large quantities of carbide to dealers in Manchester, Belfast, Dublin and Liverpool and our carbide is quite satisfactory. In many cases we have had tests made previous to shipments by analysts of Montreal and in every case the certificate received shows the quality considerably in advance of the standard set forth by the English Association.

The statement that in some instances carbide was found which produced gas which ran from 25 to 33 1-3 less than the standard amount has no reference to Shawinigan carbide. Other manufacturers in Canada may speak for themselves, but I am prepared to support my contention that such statements that are contained in your article have no foundation as applying to the output of this company..

I trust you will be good enough to give this statement as broad publicity as is warranted by your previous article.

Thanking you in anticipation, we are

Very truly yours,
Howard Murray,
Secretary-Treasurer.

The Shawinigan Carbide Co., Montreal.

* * *

Gentlemen:—

Our attention has been attracted by an article on page 451 of your issue for this month. We have read the item with interest and feel that you cannot express too strong disapprobation of the course of Canadian manufacturers who supply inferior articles for the export market, and more especially for the market in Great Britain. We wish to state that we have not sent any carbide to the Old Country for at least two years, and the material about which complaints were made could not have been supplied by us. We operate a large factory here at Ottawa, and mantain a uniformly high standard for all our goods whether they are for domestic or foreign markets. We would appreciate it if you would insert a note in your periodical to the effect that the carbide mentioned in your article of this month was not furnished by us.

Yours truly,
The Ottawa Carbide Co., Ltd.
L. Crannell, Sec-Treas.

Our Water Powers

Niagara Power in Toronto.

SINCE power was first turned on in Toronto from Niagara in November there has been some trouble in continuity of service of between 3,000 and 4,000 h.p. expected by the Toronto Electric Light Co. for their light and for motor power for the Street Railway only a small part is available each day after 3.30 p.m., the reason being that work on turbines, generators and the other necessary appliances is not nearly complete and the generators now ready cannot be operated, while the workmen are busy, to meet further the demand in Toronto the work on the turbines has been so arranged that when the Toronto Railways and the Electric Light Companies become urgent the day's work on the power house installations ceases and the current is turned on. At present the Toronto Railway Co. has turned over to the Electric Light Co. about 2,000 h.p. daily. This has made it possible for the Light Co. to use all its wires, pending the completion of the Electric Light Co.'s own transforming plant.

* * *

Vancouver's Water System.

The conservation of an adequate water supply for the city of Vancouver is a subject of towering importance to that city at the present time. The city officials visited the Governmont with a request that a reservoir be placed on the watershed of Seymour Creek that the supply might be protected from the depredations of lumbermen. As Vancouver grows larger it will require this water some day so that the city officials are wise in looking ahead to the future requirements of a great city as Vancouver is destined to become.

* * *

Power for Berlin.

The citizens of central western Ontario are greatly interested in the Power Commission's work in connection with supplying Niagara power to that district. At a meeting held on Dec. 5th, forty delegates from Galt, Guelph, Waterloo, Berlin, Acton and Mount Forest met in conference on the western power question in the Council Room of that city. Hon. Mr. Beck was present at the meeting, at which he was enthusiastically received, and there he clearly outlined the subject and gave a stirring address on the opportunity of the hour. A feature of the meeting was the endorsing of the work done by the Power Commission. The meeting pledged itself to do all in its power to secure all the necessary by-laws and the largest possible number of names in the forthcoming municipal elections. Mr. Cecil B. Smith gave an expert memorandum on the power situation in Berlin. The city is using 300 h.p. at present at a cost of $1,000.00 per month, which figured out $35.00 per h.p., considered on the maximum consumption, and $66.00 on the average consumption. The question was asked Mr. Beck if electrical power from Niagara would be cheaper than the power supplied by the present city plant, to which Mr. Beck replied that Niagara power would be much cheaper. A big saving will be effected as soon as the consumption grows and the city goes ahead.

* * *

Electricity for St. John.

The Grand Falls Power Company have offered to supply electrical power to the city of St. John, N.B., for 30 years at named maximum figures, which according to the company's estimates will effect the saving of $250,000 a year to users of power in St. John. It is proposed to develop sixty thousand horse power at the falls, with storage facility to increase the horse power by 25 per cent.

* * *

Calgary's Possibilities.

The water power proposition has been placed before the city of Calgary, that will not only involve an enormous outlay, but mean much to the future manufacturing interests of that City. It is one of the biggest propositions with which the city has yet been confronted. The proposition is to furnish power and light to the city by a company, and the city distribute it. W. M. Alexander of Brandon is interested in the scheme. He proposes to work for a street railway franchise which the city is at liberty to buy out in ten years. Mr. Alexander is a street railway man, and is conversant with the railway business.

Murchey Machine Co., Detroit.
The Norton Company, Worcester, Mass.
Producer Gas Co., Toronto.

A Glad and Happy New Year

Apart from the exhilarating joy of mere existence that should be ever present there is in the Spirit of the New Year an added zest and interest in life. The past year with whatever of good or ill it may have brought is gone forever and another opens before us with all the freshness and gladness and glowing possibilities that the mind's eye may see fit to conjure.

May the coming New Year see for you the long delayed hope fulfilled and the cherished ambition realized. May this New Year be the happiest you have yet seen and full of that joy and gladness and content that go towards the Life Ideal.

THE CANADIAN TARIFF.

THE old rule that first impressions are always best does not hold good with the new Canadian tariff as the more time that is taken to digest its provisions, the more hidden changes come to the surface.

Many of the changes made are not only mystifying, but they are annoying without purpose, the gain for instance in the new regulation regarding packages—that packages on good paying ad valorem rates are dutiable at 20 per cent. where they are charged for separately on invoices—will be trivial to the Government in comparison to the trouble and extra expense it will cause importers particularly of light goods such as glass chimneys and globes.

Another change which will cause endless trouble is the change in the regulation providing that any article imported shall be subjected to the highest duty charged on any of its parts. That was plain and easily understood, but the new reading that duty will be charged on most important item contained in the article will lead to much controversy and varying decisions by different appraisers.

The contradictions in the new tariff are also many, the chief one being in first reducing the duty on mowers and binders from 20 to 17½ per cent., then giving in return a 95 per cent. rebate on all duties paid on iron and steel imported for goods manufactured for home consumption, after granting a continued bonus to the iron and steel industry. The reduction in duty pleases the farmers, while the rebate squares the implement manufacturers, but it also nullifies the advantage of the bonus to develop a home iron industry.

Without discussing the merits of the bonus system, other than to point out that its continuation for 3½ years will mean upwards of $10,000,000 to the existing iron and steel companies, this being a rather high price to pay to industries which are already fairly well established, we must look with disfavor on the introduction of the drawback system as applied to manufactures for home consumption as it grants favors to one industry not enjoyed by others. Why discriminate against wire manufacturers and foundrymen in favor of implement manufacturers?

The complete change in the classification of items makes the new tariff a brain-racker. An attempt has been made to group all items of a similar nature together but the effort has not been entirely successful as many items are entirely out of their groupings, earthenware items being in amongst metals and bronze powder, gold paint, etc., being nearly a hundred items away from other paints. Many suggestions for simplifying the tariff were made before the Tariff Commission, but few have evidently been adopted.

Taken as a whole the machinery and allied trades are not greatly affected by the tariff changes. A slight increase in the duty on machine tools, machinery parts and boilers has been off-set by a corresponding increase on the duty on raw materials. The iron and steel interests are asking that the implement makers' 95 per cent. rebate on pig iron be cut off. Rolling mill men are protesting against the new duty on steel billets and agitating for the old conditions on rolled and barred iron, sheet steel, etc. Metal merchants are protesting that the new tariff will force them out of the boiler plate and structural iron business.

TECHNICAL EDUCATION ENDORSED.

CONSIDERABLE significance is attached to the utterance of Premier Gouin of Quebec, at the recent banquet given by the Canadian Manufacturers' Association, to ex-President Ballantyne, especially as he outlined the policy of his Government with regard to technical schools.

For many years past, an agitation has been carried on by the manufacturers, trade unions and educationalists of the country, aiming at the establishment of institutions where mechanics and factory hands could learn the technicalities of their respective trades. Many schemes of education have been proposed tending to put students—machinists, boiler makers, plumbers, and a host of others—in touch with broad, general principles which they could readily adapt to the particular requirements of their work.

But the question of ways and means was the most difficult, and it was incessantly debated whether the responsibility for financing the schools should rest with the federal, provincial or civic Government. New hope was aroused, when, after the conference of Provincial Premiers, it was announced by Premier Gouin that the additional subsidy for Quebec would be largely devoted to education. Consequently, the supporters of technical schools, awaited with great interest, some official announcement in the matter.

And such is the construction which has been placed upon the latest speech of the Premier. Speaking to manufacturers, who are particularly interested in advancing the excellence of goods "made in Canada," by educating their workmen, he, first of all, warned them that they, themselves were neglecting their duty. In Germany, where technical education has played so prominent a part in the country's industrial supremacy, the crusade was begun by the manufacturers establishing and supporting schools. In this country, too, said Mr. Gouin, the manufacturers who have most at stake, should advance from resolutions to actions. Amid great applause, he promised liberal assistance from the Government, to such a movement. And now, the public await the action of the Quebec manufacturers. It's apparently "up to them."

THE STEAM TURBINE AND ITS FUIURE.

DURING the initial stages in the creation of any new form of engine, it is only natural that the discussion should be confined to a comparatively few leading engineers, and designers, for at the outset it must take men of imagination to foresee, and to mentally shepherd, the development. As the machine is used, and becomes less of a rarity, and as the practical men—the puddling, keep-it-going engineers, have more and more to meet emergencies, and to contrive expedients, the development takes on a new complexion, from the steady enforcement of a new point of view.

The theoretical engineer is, of course, much concerned with critical points in the principles of his engine, and it is almost inevitable that he should veil his ideas in the higher mathematics. The formula for a curve is in his estimation all important—and no doubt that bias of thought has a value in its place. But the standpoint of the practical men is somewhat different. The engineer making power, measures his engines with a coal shovel, and an oil can. While the live builder keeps busy figuring a compromise between time, cost, efficiency, appearance, and sales.

The drift of invention, engine room gossip, and shop experience, would all indicate that the steam-turbine is entering on a period of less mathematics, and more mechanical contrivance, and with this it is reasonable to expect that the steam turbine will experience a very rapid improvement in detail, and in methods of production.

At the present time the cost of turbine machinery is so considerable as, in a measure, to offset their economy, but this will improve from the consumers' point of view, from now on. The base patents of the leading types are expiring—and although the manufacturers are trying to maintain the monopoly by replacing them to some extent by improvements in auxiliaries, and details of construction, yet a glance over the advertising pages will show that makes, and makers, are even multiplying. The position of the Westinghouse-Parsons—and the Allis-Chalmers, Parsons, is an example on this continent. In Europe, the Ratean, the Riedler-Stumpf, and others, are extending the principle of De La Val's nozzle into powers, and sizes, hitherto monopolized by the Parson's. This all spells competition and education of the public.

But more important the manufacturer shows a tendency to cheaper, better wearing, or stronger forms. In this direction is the protecting wreath in the Allis-Chalmers, Parson's, or the sharp bevel edge point introduced in the building of the King's new yacht. Also simplification and improvement in the baffles at the main bearing to protect the condensers from atmosphere. Another example of the tendency, is the remodeling of the Curtis to a horizontal machine of moderate size, as now used by the Canadian General Electric.

IMPORTANCE OF A KNOWLEDGE OF COSTS.

THE element of cost is an important one in all branches of engineering, but in spite of this the average graduate of our technical colleges upon entering the field of his profession, has a very limited knowledge of the cost of engineering schemes, the cost of engineering materials and the cost of mechanical devices. His college years have been spent among theories and methods, and when upon graduating the business world demands results and asks in cold commercial terms "how much," he very often feels at a loss.

It is not desirable that our engineering colleges should have an elaborate course in estimating and cost finding, yet there should be something to direct the students' thoughts along this line. Unless this is done, he will probably neglect the commercial side of the profession to the detriment of his engineering training. Even if only a few suggestions were given as to the cost of engineering materials and their preparation it would be a step in the right direction. The student would then be led to recognize the importance of this phase of his work, and by the method of comparison could develop fairly comprehensive ideas as to the cost of different engineering enterprises and mechanical devices. And upon starting his career he would not be groping in the dark altogether in this respect.

A UNIQUE OFFER.

SOMETHING entirely new and original in the method of power plant installation has been adopted by the Producer Gas Co., of 11 Front St. East, Toronto. Their offer includes the giving away free of five suction gas plants, in which they merely divide with the users the net saving effected by their use. It implies great faith on the part of this company in the producer gas plant, and at the same time gives manufacturers time and opportunity for installing one of these plants without any cash outlay.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

DIFFERENTIAL GEAR IN CHAIN HOIST.

THE following sketches show the application of an epicylic train of gearing to one of the many chain hoists on the market.

Fig. 1 shows the usual arrangement of gears in the standard block. In this train B is held stationary on the shaft. D is loose on the shaft, but fast to the

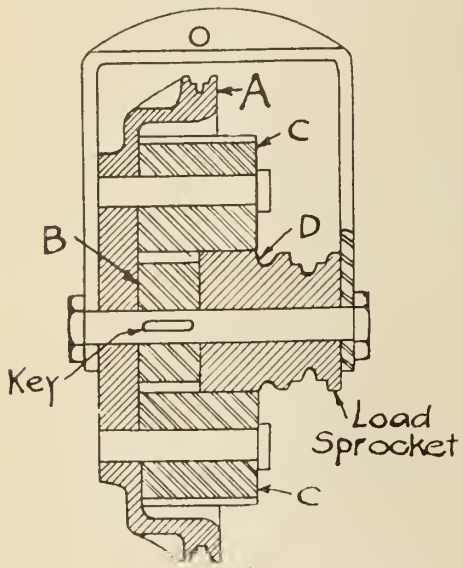

Fig. 1.

load sprocket. C, C are idlers meshing with both B and D, and turning loose on their supporting pin. A is the sproket over which the hand chain runs. B has one tooth more than D.

For example, say that D has 12 teeth and B 13 teeth. The number of teeth in C can be neglected as not affecting the speed. The result is that for every full turn of the load sprocket, sprocket A must make 12 revolutions. With 3 inches pitch diameter of the load sprocket, and 12 inches diameter of the sprocket A, then in order to raise a load up one foot 47 feet of hand chain will have to be hauled.

In connection with this chain block a little incident showing how essential is a knowledge of elementary mechanics in simple machine design will be noted. An old designer of various articles wished to make a high speed block from the one above described. The way he intended to get the high speed is shown in Fig. 2, and was by putting a pinion fast on the shaft with the hand chain sprocket, a, which meshes into a gear, f, loose on shaft. This gear was fast to a plate which held the idlers c, and c, and these were free to turn on their supporting pins.

The speed was stepped up even higher than I have indicated. I think it was to handle 500 pounds at about 200 feet per minute, a sort of dumbwaiter in disguise.

After a good deal of byplay, caused by a mechanic pronouncing the design N. G., he finally, by giving a list of about 16 patents he had received on various things, got the general manager to have a high speed block of that design made up. The gears used were cut

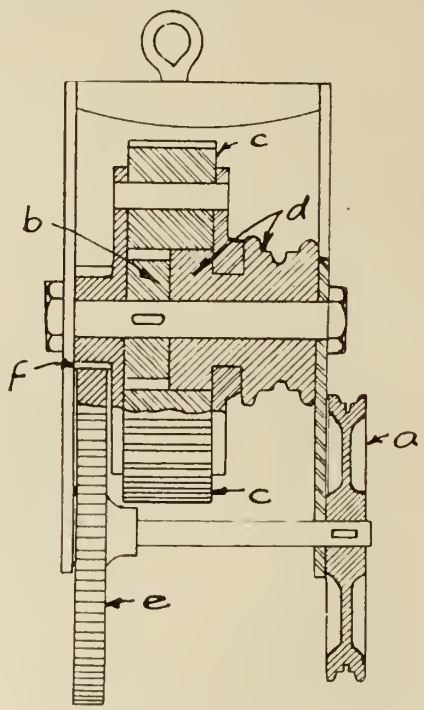

Fig. 2

gears of steel, and the whole block was well built.

Upon the day of the trial 50 pounds was attached to the load hook. Then a man attempted to haul it up. It took 500 pounds to raise the 50 pounds and even then it was not at 200 feet per minute.

When it was suggested that it would have been better to make it as in Fig. 3, as being less complicated, the designer took it as an insult.—Browning's Magazine.

VALVE SETTING.

THE opinions as to the correct settings of induction valves are many and in certain directions a very slight alteration will make a great difference to the running of the engine.

By consideration of the action of the atmospherically operated valve and its shortcomings, we should arrive at the best timing for the mechanically operated valve. The atmospheric valve requires considerable tension on its spring to close it, and, therefore, opens late; the tension, on its spring, increases as it opens, therefore it does not act regularly, but pulsates at slow speeds; it has considerable inertia, therefore if its spring is weak, to enable it to open correctly, it closes late (reducing the charge), and if sprung to close correctly reduces the charge by throttling.

The point of opening of the induction valve is not of very much consequence, as long as it is not open too early. The exhaust valve should be held open right at the top dead centre, or even a little over onto the suction stroke, so as to take full advantage of the scavenge due to the momentum of the gas through the valve. It is evidently useless to open the induction valve while the exhaust valve is open, or while the pressure in the cylinder is above atmospheric. The exhaust valve should close and the piston travel a short distance on the suction stroke before the valve opens. The valve can open quite late, provided the depression does not lift the exhaust valve, without causing very material

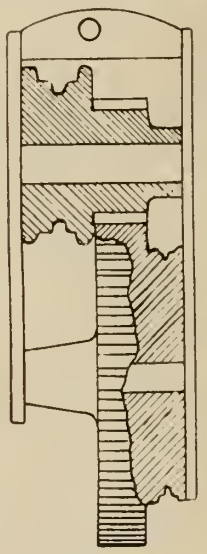

Fig. 3.

loss of power, as the difference of pressure increases the velocity of air, and with some carbureters improves the mixture at slow speeds.

The valve should be held open a short distance on the compression stroke, the distance depending on the speed the engine is to run. This does not cause a "back puff" such as is obtained with

the atmospheric valve, but allows the cylinder to fill, while the piston velocity is low, due to the momentum of the gas in the mixture pipe. It is well in extreme cases to have the charge at a pressure slightly above atmospheric at the instant induction valve closes.

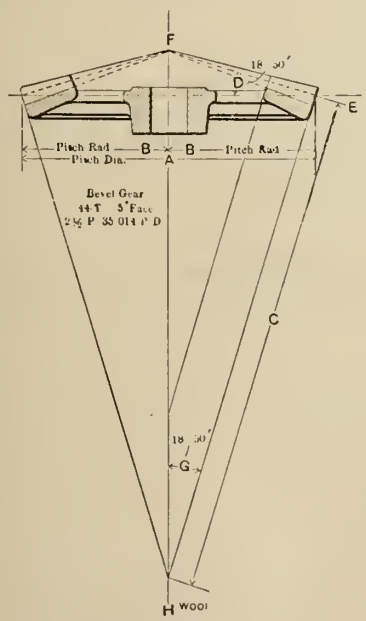
To insure that the closing valve follows the cam, the spring should be sufficiently strong to hold the valves closed against the full suction of the piston. This is, of course, a necessity in the case of the "variable lift."

The exact spring tension necessary varies with the compression ratio, but with ordinary engines it is about 11 pounds per square inch of valve area. The exhaust valve spring should be about the same strength to insure that it does not lift by suction, and to insure that it follows the cam.—The Autocar.

PROFILE OF BEVEL-GEAR TEETH.

By T. Mack.

THE number of teeth in any gear is based upon the working pitch diameter A as shown in illustration. If a gear is of 2½ inch circular pitch, and has a pitch diameter of 35.014 inches, it will have 44 teeth. However, the profile of the tooth is not to be developed as for a gear of this diameter or with a pitch radius equal to B, but as for a gear with a pitch radius equal to the back or conical radius C having a greater number of teeth. Thus a bevel gear as shown having 44 teeth, and the pitch radius B equal to 17.507 inches, would have a back radius C equal to 54.24 inches, and 136 teeth on its true outline. This number of teeth



Profile of Bevel Gear Teeth.

of course determines the tooth profile.

Frequently gears are of such proportions that it is not convenient to determine the length of the back radius C by a layout. When such is the case it can be calculated in the following manner: If it is desired to calculate the back radius C, corresponding to a gear having a pitch radius equal to B, we first subtract from 90 degrees the angle D formed by the centre of tooth line E-F and the pitch diameter A. In this case that is 18 degrees 50 feet, and which is also the Angle G formed by the back radius of C and centre line of gear H F. From a table of natural sines take the sine of 18 degrees 50 feet, which is .32282, divide the working pitch radius B by this decimal and you get the length of the back radius C. Having obtained this radius, calculations are next made for the tooth profile in the ordinary manner.

PISTON RING GRINDER.

A MACHINE for finishing piston rings, particularly automobile and gas engine rings, is described. As will be gathered from the illustrations, it is intended only for grinding the periphery of the rings and not their sides. This it will do on rings up to 6 inches in diameter. To finish their circumference accurately, it is of special

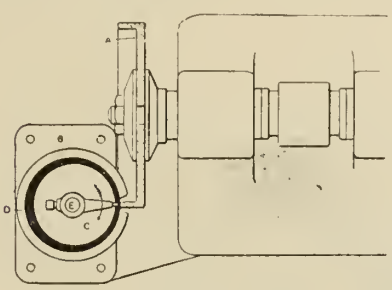


Fig. 1.

importance that the rings be ground under conditions similar to those that will exist in the engine; in other words, they must be ground while in tension. Hand-fitting that is required by the usual method of ring-grinding, is entirely avoided.

Figs. 1 and 2 give two elevations and a top view of the wheel and work, by referring to which the operation may be clearly understood.

The ring D is held in a shallow, cup-shaped piece B, which in turn is bolted to the movable slotted platen. The ring holder or cup-shaped piece does not turn around, but is bored out on the top side to about the diameter of the piston to take the ring. In the middle and driven from a worm-wheel below, there is located a vertical shaft E, on which is fastened a finger-like driver C, the end of which engages in the slot between the ends of the ring. It will be seen that when the vertical shaft is slowly revolved the ring will be moved inside the cup and its shape constantly changed as the high spots are ground off until the wheel touches all the way round, and then the ring is finished. To obtain a grinding contact the platen, ring and holder are moved bodily up to the face of a cupped emery wheel A, which gains access to the ring through a narrow notch cut out of the ring holder, as may be seen in the plan in Fig. 2.

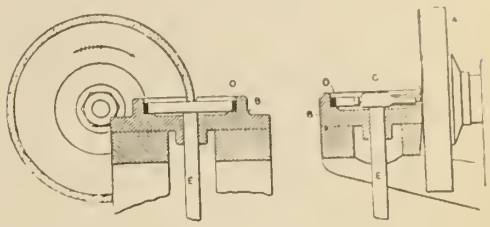

Fig.2.

The ring-driving mechanism is driven by belt from the spindle to a shaft running through the column and connected at its opposite end to a worm and worm-wheel, and thence through universal joints and shafts to the ring driver. By changing the outer spindle pulley any desired ring speed can be obtained. The handle is used to engage and disengage the worm and worm-wheel, and in the latter condition the ring can easily be moved by the hand lent accord with the service required of wheel on the vertical shaft.

The machine is constructed in excelit. It is heavy and rigid throughout to take up vibration, and the head and the part on which the head rests are solid material; the column alone weighs 325 pounds. The bearings are dustproof, and are tapered so that they may be adjusted for wear. To the proper working of a machine of this character end play of the spindle is not permissible. To avoid it an adjustable tension arrangement has been placed at the end of the spindle opposite the emery wheel.

A ring which is turned larger than the bore of the cylinder, whether it be of uniform thickness, bored eccentrically or cast to a theoretical tension curve inside, will not have uniform tension or bearing on the surface of the cylinder until it is filed or scraped to a fit or let run until it wears itself to a bearing. The latter method of obtaining a fit is obviously undesirable, as it requires time, and in gas-engine manufacture, where the efficiency depends to a large extent on the compression, the rings must have perfect bearing. It is the contention of the manufacturer of this grinder that the only way to obtain such a perfect bearing is to grind the ring under the same conditions, or in tension, as it is subjected to under working conditions.

The grinding wheel is 10 in. in diameter, the spindle pulley runs at from 2,000 to 2,200 revs. per minute, the height of the spindle from the floor is 40 in., the base of the machine is 26 by 26 in., and the weight complete, without the countershaft 800lbs.—Iron Age.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

SYSTEM IN FINDING FOUNDRY COSTS.

By D. C. Eggleston.

NOTWITHSTANDING the advance made in finding costs of production during the last few years it is generally true that the iron foundry has been neglected. Where the attention of cost system experts has been directed toward the iron foundry the tendency has been to try and adapt systems used in other departments. However, the work of the iron foundry is so different in nature from that of other departments that a radical departure must be made from the methods elsewhere employed.

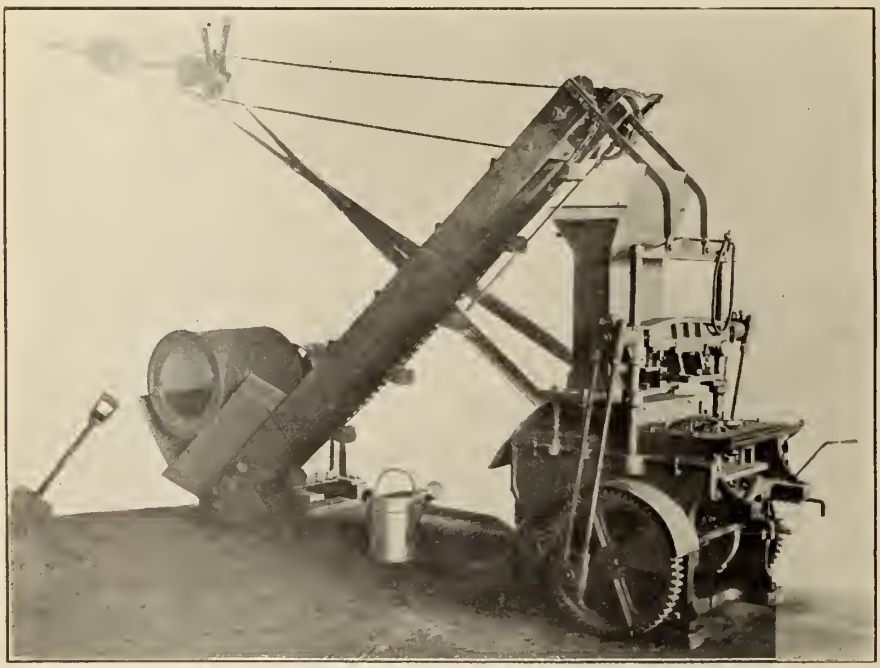
In any iron foundry an analysis of the expense shows that it is incurred in connection with the cupola and several classes of work. The output of the former is in pounds of metal and of the latter in hours of labor. This suggests that the entire cupola expense should be prorated according to the number of pounds of castings produced and the expense against other classes of work on the basis of man-hours worked.

This method requires a division of expense between the cupola and other classes of work. In most cases no difficulty need be experienced in doing this; coke, fire-brick, ladles, lime stone, wood and some water are chargeable to cupola expense. The time of the foremen and foremen's clerks should be divided between cupola and other divisions of expense by estimate of the time spent on coke, pig iron, charging sheet and output reports. The administration expense not chargeable to the cupola should be distributed to other classes of work on the basis of the number of man hours in each. The rent expense includes all charges on account of grounds, buildings, heating, lighting and fire service. This division of expense is distributed on the basis of the number of square feet of floor space occupied by each class of work. Power expense should be distributed by estimate to the various classes of work.

The foundry clerk should keep a card file on which he records tools such as shovels and sieves received, given out (noting to which class of work), and the number on hand. Reference to the file facilitates the distribution of supplies. There are often some items concerning which there is doubt as to just which division of work they should be assessed. In such cases it is necessary to consult the foundry foreman that as accurate a division may be made as possible.

It is the best practice to assign letters indicative of the various rates of expense on the different classes of labor. Thus I. F. A. may be used to denote the rate on core work; I. F. B. on crane moulding, and so on. The foreman's clerk notes the proper letters on the workman's time ticket so that the expense can be added simultaneously with the productive labor to the cost of the hob. To the cost of metal the rate per pound for cupola expense can be added, thus giving the indirect expense incurred in connection with the cupola. The sum of productive labor, labor expense, raw material and cupola expense gives the total cost of producing the castings on an order.

In the statement of shop deliveries the productive labor, raw material and expense accounts should be credited and piece parts account is credited and the the casting is used on an order the the piece parts account debited. When proper account debited. Thus the cost system herewith described not only gives accurate costs of production, but also facilitates in keeping a check on the work of the iron foundry. If it is desired to cut down expense a study of the exhibit of iron foundry figures will suggest valuable economies. Comparative figures aid in showing wherein the increase or decrease lies. That the system herein described has been evolved to meet the requirements of the iron foundry in a large manufacturing works where it is in successful operation, recommends it to the attention of iron foundrymen.—Iron Age.



Berkshire Molding Machine.

BERKSHIRE MOLDING MACHINE.

IN MOST molding machines only one or two of the operations of making the mold are actually performed by the machine. In the Berkshire molding machine, manufactured by the Berkshire Manufacturing Company, Cleveland, Ohio, as the bulletin reads, "You push the lever, the machine does all the rest."

When operating the Berkshire machine the flask and bottom board are placed in position and the lever for starting the machine is thrown. The sand is riddled back of the machine and elevated by a bucket elevator to a suitable hopper above the machine.

The machine automatically carries the flask to the rear, where it is filled with sand, it then travels forward and in its

course is met by the bottom board, supported upon the ram, which is forced down, ramming the sand. The vibrator is immediately thrown into action and at the same time lifting pins raise the flask off from the pattern. As the flask goes back to receive its charge of sand the bottom board is supported by suitable hooks, but as the ram comes down these hooks are drawn back so that the board remains upon the mold. All that the operator has to do is to lift the flask off and set it to one side, blow the sand from the table by means of the air hose, when all is ready for placing the other half of the flask and making the other half of the mold. The operator economizes time by placing the second half of the flask upon his machine and starting the machine before he starts to the floor with the half of the mold that has been completed. By the time he has placed the complete half of the mold on the floor, the second half has been finished by the machine, and is ready to be lifted off and carried to the floor. When using snap flasks and making light molds, the mold can be assembled on a bench by the side of the machine and only one trip to the floor made. In this case the molder can have two sets of flasks and arrange it so that the machine is ramming the drag for the second mold while he is carrying the first to the floor.

When making the cope the machine is so arranged that it cuts the sprue. In fact, the machine does all the work, so that all the operator has to do is to place the flask and board in position, throw the lever, and in eight seconds remove the finished half of the mold.

The pressure with which the ram presses the sand can be quickly adjusted, and as the flasks are filled automatically, all flasks are sure to be rammed alike. It is also possible to adjust the boards in such a way that the drag will be rammed harder than the cope.

One interesting point about the machine is that the pattern plates are heated by gas jets from beneath, so that the molds draw readily without the use of any parting material whatever. By the use of the proper grade of molding sand, very fine work can be made in this way without any facing, and the fact that no parting sand is introduced will greatly increase the life of the molding sand.

A PECULIAR CHILLED CASTING.*

By George C. Davis

THE casting to which I am about to call your attention presents some unusual features. For this reason I wish to describe it, even though I have no theory as to its cause, nor am I able to give all the data. The accompanying illustrations, Figs. 1 to 4, all show parts of the same casting. As shown in Fig. 1, it varies in thickness from ⅛ to ½in., and in places has a wedge-shaped chill surrounded by grey iron on each side. A part of the casting, even in the light section, is grey without trace of chill, though it is hard. The analyses are given in the following table :—

	A. per cent.	B. per cent.
Silicon	2.61	3.16
Sulphur	0.106	0.102
Phosphorous	0.60	0.74
Manganese	0.36	0.19
Graphitic carbon	3.40	0.19
Combined carbon		3.04

Owing to the difficulty in sampling, I am not able to present separate analyses of the grey and white portions. The figures given under A represent the casting illustrated in Fig. 1. The drillings were taken as near as possible to the chilled part. Sample B was taken at the foundry and represents the white portion from several castings made at a later date than A.

Before proceeding with the discussion I will give the method of charging, so far as I can, as follows :—

Diameter of cupola	43in.
Bed of cupola, broken coal	400lb.
Bed of cupola, coke	1400lb
Smelting charge, pig iron	4000lb.
Smelting charge, sprues	2000lb.
Subsequent charges, coke	350lb.
Subsequent charges, pig iron	1600lb.
Subsequent charges, sprues	1200lb.
Total melt, about	15 tons.

The first discussion I have been able to find on internally chilled castings is in vol. 17, p. 700, of the Transactions of the American Institute of Mechanical Engineers. An analysis is given which is as follows :—

	White inside Per cent.	Grey outside Per cent.
Silicon	2.74	2.85
Combined carbon	2.55	1.75
Graphitic carbon	1.31	1.87
Manganese	0.50	——

Phosphorous and sulphur are not given, but it is stated that no marked difference in these elements was found in the two samples. Internal chill is sometimes seen in pig iron, and this was at first thought to be due to segregation of sulphur or manganese. So far as I know, this has never been proved, and the analyses I can recall show little difference between the grey and white portions of the pig iron, except in the ratio of graphitic to combined carbon.

To return to the casting under discussion, the silicon in A is correct for light work, and should give good results ; sample B is too high in this element, and I should expect a weak iron, but not a chill.

The sulphur in both cases is not excessive. In connection with this I would call your attention to the fact that while sulphur usually causes hard iron it does not always do so. I give in the table below two analyses of bad castings high in sulphur. These were water backs for ranges. They leaked under the hydraulic test, and when broken showed a porous fracture with reddish spongy spots ; as indicated in the analyses, both were soft iron, yet they contain more sulphur and less silicon than A. Another water back casting, first class in every respect, showed 0.096 per cent. sulphur, or nearly as much as sample A. I do not think there is any reason to attribute the chill to sulphur. Following are the analyses of the defective castings :—

	Per cent.	Per cent.
Silicon	2.49	2.53
Sulphur	0.153	0.142
Phosphorous	0.68	0.73
Manganese	0.52	0.46
Graphitic carbon	2.94	2.63
Combined carbon	0.24	0.59

Returning to the analyses given at the beginning of this paper, the phosphorus in both A and B is about as it should be ; there is no reason to suppose it had anything to do with the chill.

The manganese evidently had nothing to do with the chill, as it is normal in A and low in B. The total carbon in A is correct for this class of work. In B it is a little low, as might be expected, owing to the high silicon, for in pig iron, as a rule, silicon increases and carbon decreases.

Another theory held by many is that the cause is in the management of the cupola and pouring. I quote the views of a well-known furnaceman, who writes writes me as follows :—

"I have noticed that this peculiar condition—grey on the exterior and white on the interior—oftentimes in very thin pieces of casting is due more to the melting of the iron than to the chemical composition of the iron. It cannot occur, however, with low silicon iron. So far as my experience goes it is characteristic of the use of high silicon iron which has been melted in a cupola with a cold bottom, enabling the iron to take up sulphur, or the iron has been well melted and run into cold ladles, under which condition certain chemical changes take place, which have been remedied by melting the iron hotter, thus reducing the percentage of sulphur, and also in tapping the iron into hot ladles instead of moderately warm ladles."

* Paper read before the Philadelphia Foundrymen's Association.

On the Art of Cutting Metals

By F. W. Taylor

THIS paper, as presented to the Society by the president, Mr. F. W. Taylor, is of great length and in this article only the main features of his address are outlined. The experiments on the art of cutting metals which were carried on by Mr. Taylor and his colleagues, outlined in the paper, were continued through a period of twenty-six years, in various shops and at the expense of the owners of the shops. These shops include the Midvale Steel Co., Cramp Shipbuilding Co., Wm. Sellers & Co., the Link Belt Engineering Co. Dodge & Day, and the Bethlehem Steel Co., the latter more than all. In carrying out these experiments more than 10 machines have been fitted up at various times, all the machines used since 1894 being equipped with electric drive so as to obtain any desired cutting speed; and in the studying of these laws more than 800,000 pounds of steel and iron were cut into chips. It is estimated that between $150,000 and $200,000 have been spent upon this work, and it is significant that those who bore this expense had ample return in the increased output and economy in running their shops as a result of the experimental work. During the running of the experiments all the companies concerned and all who had anything to do with the experimental work, were bound by promise to the writer of the paper to secrecy concerning the results of the experiments, and it is a notable fact that through a period of 26 years none of the many men or companies connected with this work has broken a promise.

Some of the most important lessons learned by the author in the conducting of these experiments, particularly to young men, are:

1. Several men when heartily co-operating, even if of everyday calibre, can accomplish what would be next to impossible for any one man even of exceptional ability.

2. Expensive experiments can be successfully carried on by men without money, and the most difficult mathematical problems can be solved by very ordinary mathematicians, providing only that they are willing to pay the price in time, patience and hard work.

3. The old adage is again made good that all things come to him who waits, if only he works hard enough in the meantime.

The experiments described in this paper were undertaken by the author to obtain part of the information necessary to establish in a machine shop his system of management, the central idea of which is:

(a) To give each workman each day in advance a definite task, with detailed written instructions, and an exact time allowance for each element of the work.

(b) To pay extraordinary high wages to those who perform their tasks in the allotted time, and ordinary wages to those who take more than their time allowance.

There are three questions which must be answered each day in every machine shop by every machinist who is running a metal-cutting machine, such as a lathe, planer, drill press, milling machine, etc., namely:

(a) What tool shall I use?

(b) What cutting speed shall I use?

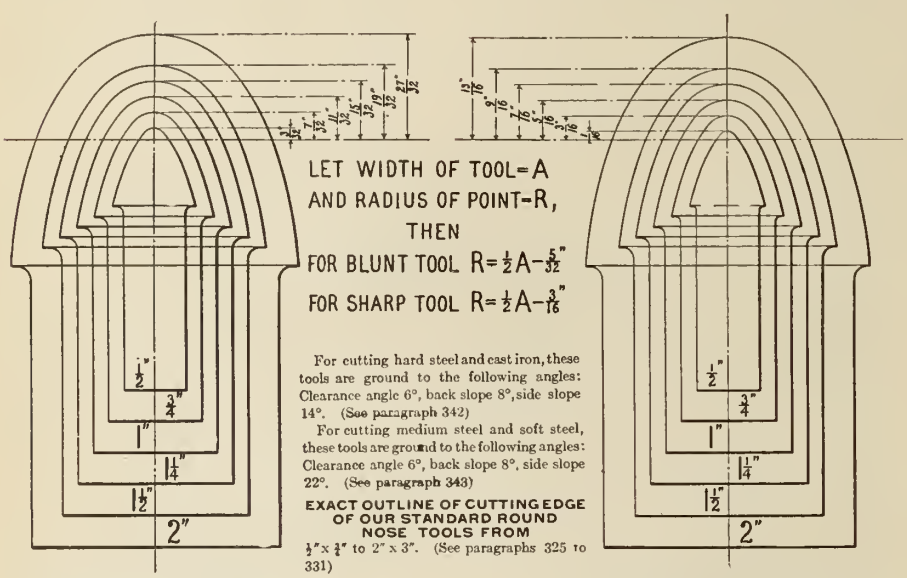
(c) What feed shall I use?

These investigations which were started with the definite purpose of finding the true answer to these questions under all the varying conditions of machine shop practice have been carried on up to the present time with this as the main object still in view.

The writer has confined himself almost exclusively to an attempted solution of this problem as it affects "roughing work"; i.e., the preparations of the forgings or castings for the final finishing cut, which is taken only in those cases where great accuracy or high finish is called for. Fine finishing cuts will not be dealt with. The principal object has been to describe the fundamental laws and principles which will enable them to do "roughing work" in the shortest time, whether the cuts are light or heavy, whether the work is rigid or elastic, and whether the machine tools are light and of small driving power or heavy and rigid with ample driving power.

In other words, the problem has been to take the work and machines as they are found in a machine shop, and by properly changing the countershaft speeds, equipping the shop with tools of the best quality and shapes, and then making a slide rule for each machine to enable an intelligent mechanic with the aid of these slide rules to tell each workman how to do each piece of work in the quickest time.

It is to be distinctly understood that this is not a vague, Utopian result, to be hoped for in the future, but that it is an accomplished fact, and has been the daily practice in our machine shops for several years; and that the three great questions, as to shape of tools, speed, and feed, above referred to, are



LET WIDTH OF TOOL=A
AND RADIUS OF POINT=R,
THEN
FOR BLUNT TOOL R=½A-5/32"
FOR SHARP TOOL R=½A-3/16"
For cutting hard steel and cast iron, these tools are ground to the following angles: Clearance angle 6°, back slope 8°, side slope 14°. (See paragraph 342)
For cutting medium steel and soft steel, these tools are ground to the following angles: Clearance angle 6°, back slope 8°, side slope 22°. (See paragraph 343)

BLUNT TOOL FOR CUTTING HARD STEEL AND CAST IRON

SHARP TOOL FOR CUTTING MEDIUM AND SOFT STEEL

* A synopsis of a paper presented to the American Society of Mechanical Engineers, by F. W. Taylor, president, at the annual convention held in New York during the first week in December.

daily answered for all of the men in each shop far better by our one trained mechanic with the aid of his slide rule than they were formerly by the many machinists, each one of whom ran his own machine, etc., to suit his foreman or himself.

It may seem strange to say that a slide rule enables a good mechanic to double the output of a machine which has been run, for example, for ten years by a first-class machinist having exceptional knowledge of and experience with his machine, and who has been using his best judgment. Yet, our observation shows that, on the average, this understates the fact

To make the reason for this more clear it should be understood that the man with the aid of his slide rule is called upon to determine the effect which each of the twelve elements or variables given below has upon the choice of cutting speed and feed; and it will be evident that the mechanic, expert or mathematician does not live, who, without the aid of a slide rule or its equivalent, can hold in his head these twelve variables and measure their joint effect upon the problem.

These twelve elements or variables are as follows:

(a) The quality of the metal which is to be cut;

(b) The diameter of the work;

(c) The depth of the cut;

(d) The thickness of the shaving;

(e) The elasticity of the work and of the tool;

(f) The shape or contour of the cutting edge of the tool, together with its clearance and lip angles;

(g) The chemical composition of the steel from which the tool is made, and the heat treatment of the tool;

(h) Whether a copious stream of water, or other cooling medium, is used on the tool;

(j) The duration of the cut; i.e., the time which a tool must last under pressure of the shaving without being reground;

(k) The pressure of the clip or shaving upon the tool;

(l) The changes of speed and feed possible in the lathe;

(m) The pulling and feeding power of the lathe.

Broadly speaking, the problem of studying the effect of each of the above variables upon the cutting speed and of making this study practically useful, may be divided into four sections as follows:

(a) The determination by a series of experiments of the important facts or laws connected with the art of cutting metals.

(b) The finding of mathematical expressions for these laws which are so simple as to be suited to daily use.

(c) The investigation of the limitations and possibilities of metal cutting machines.

(d) The development of an instrument (a slide rule) which embodies, on the one hand, the laws of cutting metals and on the other, the possibilities and limitations of the particular lathe or planer, etc., to which it applies and which can be used by a machinist with-

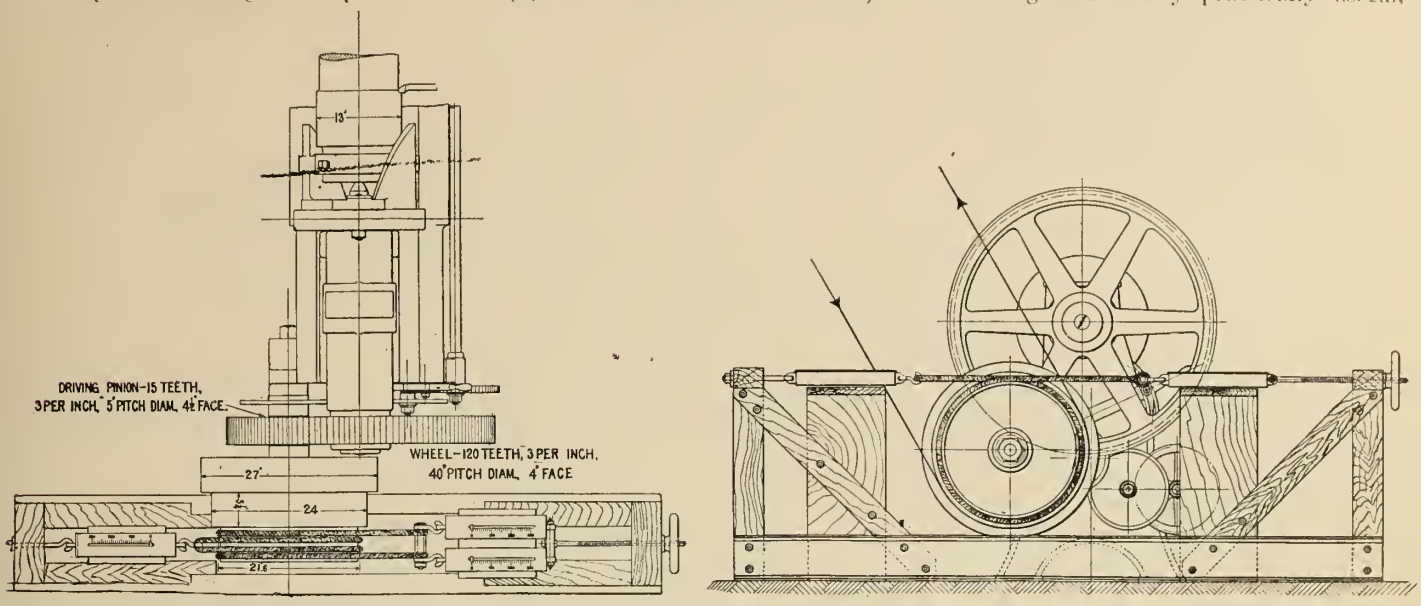

Fig. 1—Lathe Used in Determining the Pressure of the Chip on the Tool.

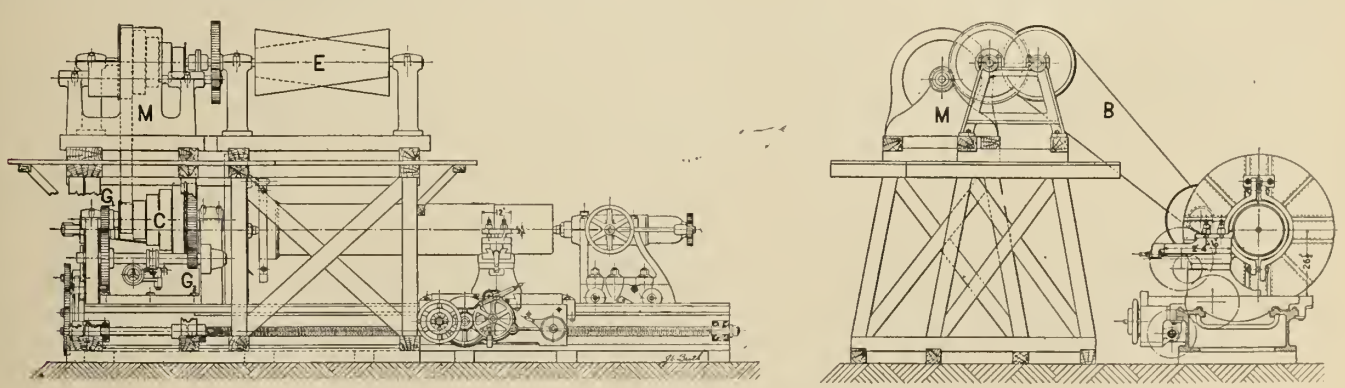

Fig. 2—Experimental Lathe at the Works of the Bethlehem Steel Co.

out mathematical training to quickly indicate in each case the speed and feed which will do the work quickest and best.

Important Steps in the Progress of the Experiments.

The writer has no doubt that many of the discoveries and conclusions which mark the progress of this work have been and are well known to other engineers, and we do not record them with any certainty that we were the first to discover or formulate them, but merely to indicate some of the landmarks in the development of our own experiments, which to us were new and of value. The following is a record of some of our more important steps:

(a) In 1881, the discovery that a round-nosed tool could be run under given conditions at a much higher cutting speed and therefore turn out much more work than the old-fashioned diamond-pointed tool.

(b) In 1881, the demonstration that, broadly speaking, the use of coarse feeds accompanied by their necessarily

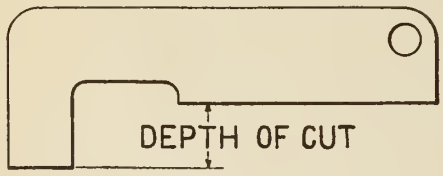

Fig. 3—Intrument Used for Maintaining the Depth of the Cut Uniform.

slow cutting speeds would do more work than the fine feeds with their accompanying high speeds.

(c) In 1883, the discovery that a heavy stream of water poured directly upon the chip at the point where it is being removed from the steel forging

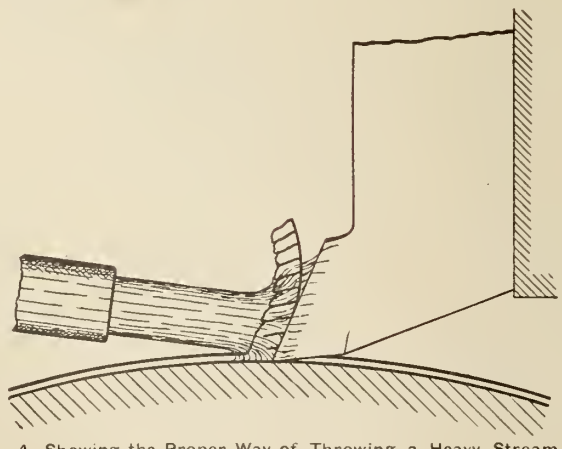

Fig. 4—Showing the Proper Way of Throwing a Heavy Stream of Water on Tool to Cool It.

by the tool, would permit an increase in cutting speed, and, therefore, in the amount of work done from 30 to 40 per cent.

(d) In 1883, the completion of a set of experiments with the round-nosed tools; first, with varying thickness of feed when the depth of the cut was maintained constant, to determine the effect of these two elements on the cutting speed.

(e) In 1883, the demonstration of the fact that the longer a tool is called upon the work continously under the pressure of a shaving, the slower must be the cutting speed, and the exact determination of the effect of the duration of the cut upon the cutting speed.

(f) In 1883, the development of the formulae which gave the mathematical expression to the two broad laws above referred to. Fortunately these formulae were of the type capable of logarithmic expression and therefore suited to the gradual mathematical development extending through a long period of years, which resulted in making our slide rules, and solved the whole problem in 1901.

(g) In 1883, the experimental determination of the pressure upon the tool required on steel tires to remove cuts of varying depths and thickness of shaving.

(h) In 1883, the starting of a set of experiments on belting described in a paper published in Transactions, Vol. 15 (1894.)

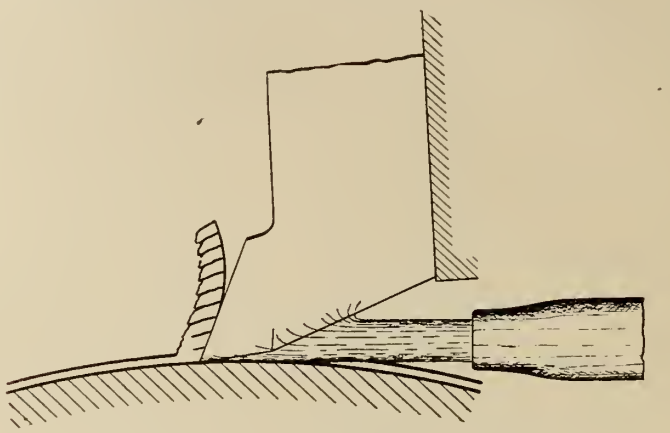

Fig. 5—Showing the Incorrect Way of Throwing Water on Tool.

(j) In 1883, the measurement of the power required to feed a round-nosed tool with varying depths of cut and thickness of shaving when cutting a steel tire.

(k) In 1884, the design of an automatic grinder for grinding tools in lots and the construction of a tool room for storing and isusng tools ready ground to the men.

(l) From 1885 to 1889, the making of a series of practical tables for a number of machines in the shops of the Midvale Steel Company, by the aid of which it was possible to give definite tasks each day to the machinists who were running machines, and which resulted in a great increase in their output.

(m) In 1886, the demonstration that the thickness of the chip or layer of metal removed by the tool has a much greater effect upon the cutting speed than any other element, and the practical use of this knowledge in making and cutting speed than any other element, and the practical use of this knowledge in making and putting into everyday use in our shops a series of broad-nosed cutting tools which enabled us to run with a coarse feed at as high a speed as had been before attained with round-nosed tools when using a fine feed, thus substituting, for a considerable portion of the work, coarse feeds and high speeds for our old maxim of coarse feeds and slow speeds.

(n) 1894 and 1895, the discovery that a greater proportional gain could be made in cutting soft metals through the use of tools made from self-hardening steels than in cutting hard metals, the gain made by the use of self-harden-

ing tools over tempered tools in cutting soft cast iron being almost 90 per cent., whereas the gain in cutting hard steels or hard cast iron was only about 45 per cent.

(p) In 1894 and 1895, the discovery that in cutting wrought iron or steel a heavy stream of water thrown upon the shaving at the nose of the tool produced a gain in cutting speed of self-hardening tools of about 33 per cent. Up to this time the makers of self-hardening steel had warned users never to use water on the tools.

(q) From 1898 to 1900, the discovery and development of the Taylor-White process of treating tools; name, the

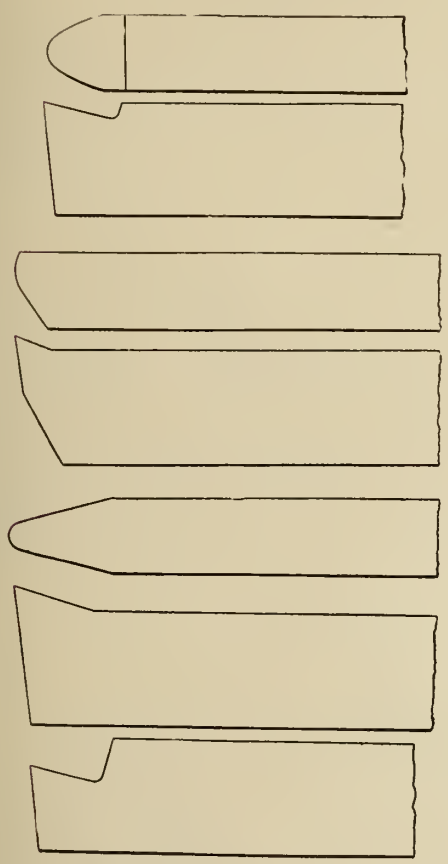

Fig. 6—Outlines of Tools as Improperly Dressed and Ground in Many Shops.

discovery that tools made from chromium-tungsten steels when heated to the melting point would do from two to four times as much work as other tools.

(r) In 1899-1902, the development of our slide rules, which are so simple that they enable an ordinary workman to make practical and rapid everyday use in the shop of all the laws and formulae deduced from our experiments.

(s) In 1906, the discovery that a heavy stream of water poured directly upon the chip at the point where it is being removed from cast iron by the tool would permit an increase in cutting speed, and therefore, in the amount of work done, of 16 per cent.

(t) In 1906, the discovery that by adding a small quantity of vanadium to tool steel to be used for making modern high speed chromium-tungsten tools heated to near the melting point, the hardness and endurance of tools, as well as their cutting speeds, are materially improved.

While many of the results of these experiments are both interesting and valuable, we regard as of by far the greatest value that portion of our experiments and of our mathematical work which has resulted in the development of the slide rules, i.e., the patient investigation and mathematical expression of the exact effects upon the cutting speed of such elements as the shape of the cutting edge of the tool, the thickness of the shaving, the depth of the cut, the quality of the metal being cut and the duration of the cut, etc. This work enables us to fix a daily task with a definite time allowance for each workman who is running a machine tool, and to pay the men a bonus for rapid work.

Belts and Individual Motor Drive.

A rather important discovery during the early experimental work was:

(1) That belting rules in common use furnished belts entirely too light for economy; and (2) that the proper way to take care of belting was to have each belt in a shop tightened at regular intervals with belt clamps especially fitted with spring balances, with which the tension of the belt was accurately weighed every time it was tightened, each belt being retightened each time to exactly the same tension.

In experiments subsequently tried extending over a period of nine years it was demonstrated that the ordinary rules gave belts only about one-half as heavy as should be used for economy.

Of late years there has been what may be almost termed a blind rush on the part of those who have wished to increase the efficiency of their machine shops towards driving each individual machine with an independent motor; and in this respect the writer makes a suggestion for which he thinks he may be accused of being old-fashioned or ultra-conservative,.

The writer is firmly convinced through large personal observation in many shops and through having himself systematized two electrical works that in perhaps three cases out of four a properly designed belt drive is preferable to the individual motor drive for machine tools. There is no question that through a term of years the total cost, on the one hand of individual motor and electrical wiring, coupled with the maintenance and repairs, of this system will far exceed the first cost of properly designed shafting and belting plus maintenance and repairs (in most shops entirely too light belts and counter-shafts of inferior design are used, and the belts are not systematically cared for by one trained man and this involves a heavy cost for maintenance.) There is no question, therefore, that in many cases the motor drive means in the end additional complication and expense rather than simplicity and economy.

It is at last admitted that there is

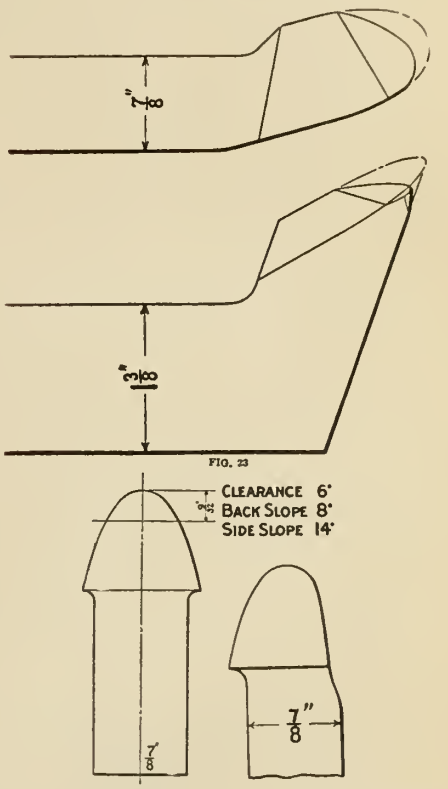

Fig. 7—The Standard ⅞-in. Tool With Which Most of Our Experiments Have Been Made.

little, if any, economy in power obtainable through promiscuous motor driving; and it will certainly be found to be a safe rule not to adopt an individual motor for driving any machine tool unless clearly evident and a large saving can be made by it.

(Concluded in Next Issue.)

The Ruby Silver Mining and Developing Company has been incorporated with a share capital of $500,000. The head office is to be at Hamilton. The company will do a mining, milling and reduction business.

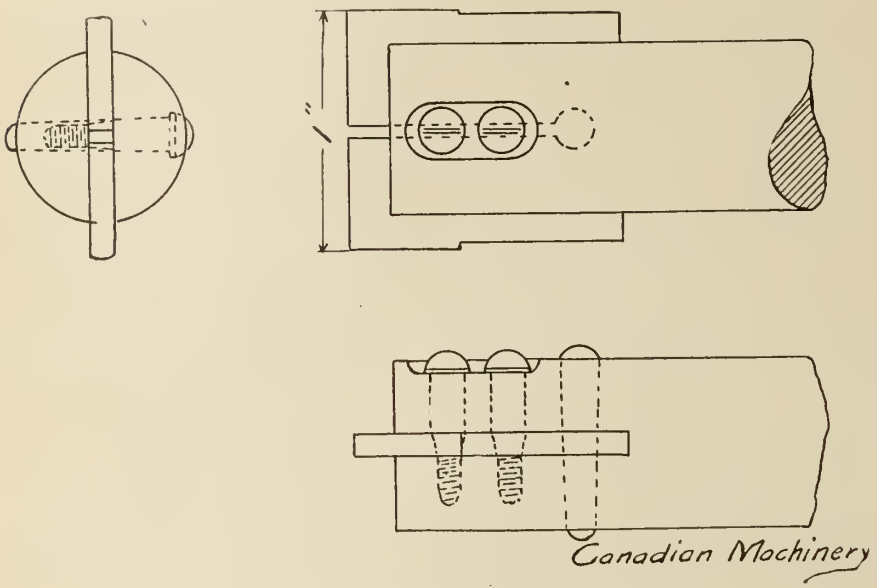
Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

EXPANDING FINISHING CUTTER.

By B. Paney, Lachine Locks.

THE first screw is taper, through the cutter for adjusting the cutter when worn. The second is for tightening the cutter after being adjusted. A hole is drilled in cutter ¼ inch from end and a 1-16 inch cut is sawn through the cutter to the hole. A taper pin placed through the hole and bar. Square headed screws should be used on larger cutters. This method is particularly applicable for Capstain lathes where a set of brushes can be kept to fit the bars.

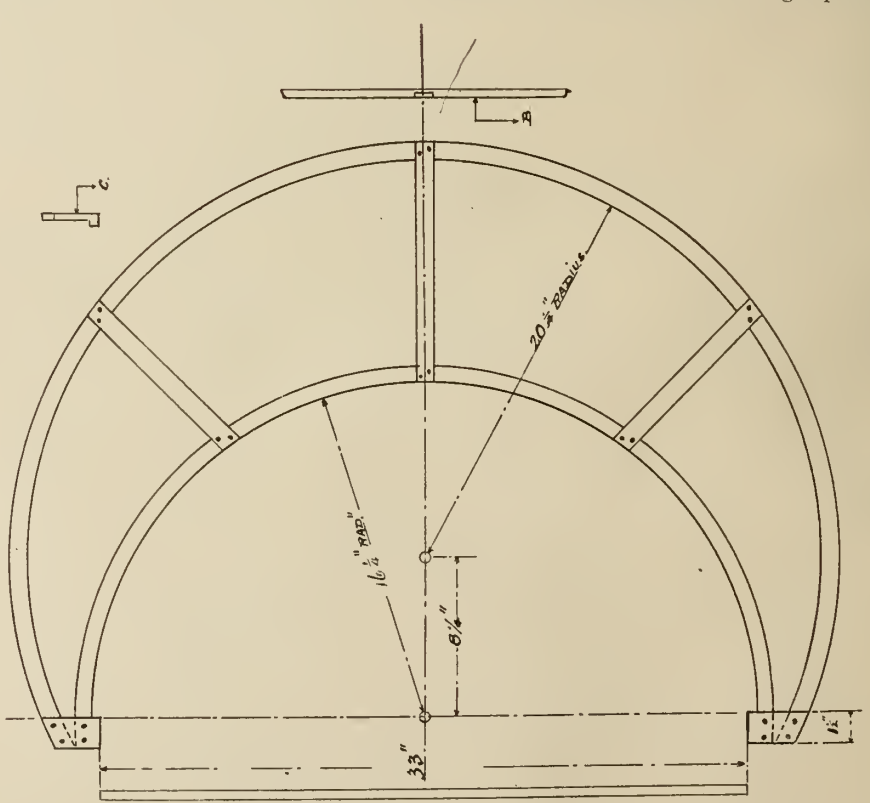


Expanding Finishing Cutter.

HOW TO MAKE A CHEAP, SERVICEABLE SNAP GAUGE.

F. E. Lauer, Niagara Falls, Ont.

THE snap gauge shown may be used on diameters ranging from 12 in. to 40 in. It is made from ¼x1 in. machine steel throughout. The first work on this gauge is done by the blacksmith when he bends the curved pieces. The first thing that is done in the tool room is to see that they are flat and then the spots are marked where the cross pieces are connected, the joint made here is half and half as drawn in section B and then drilled and rivetted. The tool steel gauge pieces are also put on as section B and are made like detail C, these gange pieces are hardened and ground. A test gauge is made and then the snap gauge is ground to its proper measurement, the test gauge is always kept in the tool room and the snap gauge is always tested before going out into the shop. This gauge can be used to advantage where a standard must be maintained, as for pistons, rotors, etc. The approximate weight of the gauge shown in the drawing is 12 lbs.



Making a Cheap Serviceable Snap Gauge.

LATHE ADJUSTMENT FOR BORING

By James C. Moore, Toronto.

HAVING occasion to bore out a number of connecting and eccentric rods, forked ends, I find my lathe face plate answered the purpose as a bolting surface. I made it adjustable by putting four studs in the saddle bolt slots as shown in the sketch. It will be found to take the place of horizontal boring mill work as the table can be elevated to any height. It will be found handy to bore out cylinders, segments, etc., and anything that one elevation is required for several pieces of the same work. By bolting an angle plate on another feature presents itself to the lathe man. In the same manner the jawed chuck can be put up and used as a vise.

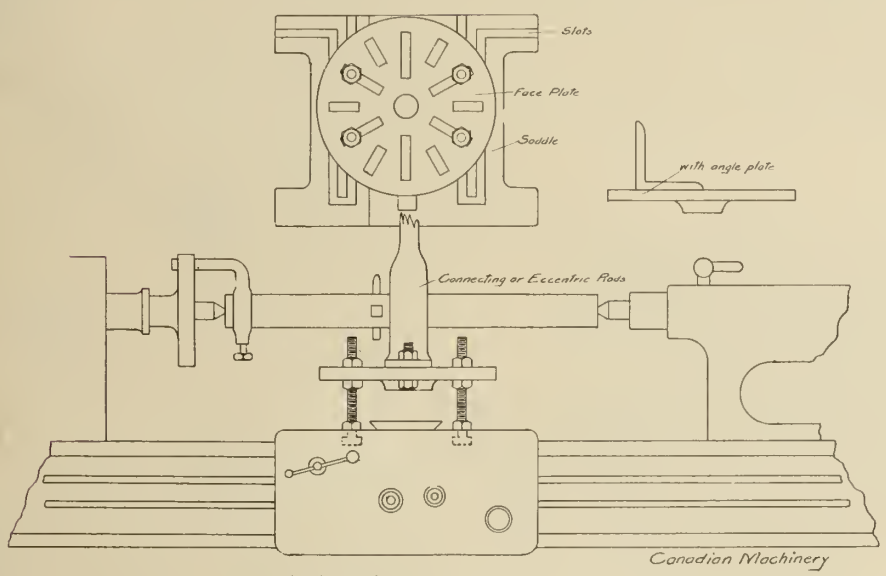
ALZEN, A NEW METAL.

Alzen is the name given to a new metal, which is composed of two parts of aluminum and one part zinc, writes United States Consul-General Guenther, from Frankfort, Germany. It is said to equal cast-iron in strength, but is much more elastic. Alzen is superior because it does not rust as easily as does iron and it takes a high polish.

BOOK REVIEWS

PRACTICAL METAL TURNING.—A hand book for machinists, technical students and amateurs, by Joseph C. Horner, A.M.I.M.E., 404 pages, fully illustrated, price $3.50. New York: Norman W. Henley Publishing Company.

This book covers in a comprehensive manner the modern practice of maching metal parts in the lathe including the regular engine lathe, its essential designs, its uses, tools, attachments and the manner of holding the work and performing the operations. The modern engine lathe, its methods, tools and a great range of accurate work, the turret lathe, its tools and accessories and methods of performing its functions, as well as chapters on special work, grinding tool holders, speeds, modern tools, steels, etc. The author of this work is well known as a mechanical writer and is the author of several other standard books on mechanical practice. Principles and practice of the different branches of turning are considered and well illustrated. As designated by the author a feature of this book is the important section devoted to modern turret practice of the lathe itself, preference being given to the practice of turning rather than to the lathe design. The book is essentially designed from the engineers' point of view. Of its practicability there is no doubt.



Lathe Adjustment for Boring.

PUNCHES, DIES AND TOOLS.—By Joseph V. Woodworth, M.E. A companion and reference volume to the author's elementary work, "Dies, Their Construction and Use for the Modern Working of Sheet Metals." A practical work of 500 pages, illustrated by nearly 700 engravings. Price, $4.00. New York: Norman W. Henley Publishing Company.

This book is a cyclopaedia of die making, punch making, die sinking, sheet metal working and making of special tools, devices and mechanical combinations for the punching, cutting, bending, forming and piercing, drawing, compressing, and assembling of sheet metal parts, and also articles of other materials in machine tools. This book is an entirely new work on the subject, nothing appearing in it that has previously appeared in the author's former book on the subject of dies. It is written by a practical man for the use of practical men interested in the working of sheet metals, the designing and constructing of punches and dies and the manufacturing of repetition parts and articles in presses. The designer, the machinist, the tool maker, the die maker and the manufacturer of sheet metal will find in this book one that fills a place heretofore vacant in the field of literature devoted to work of mechanics. The author himself is a designer of not a few of the tools illustrated in this book, which places him in a position of authority on the subject.

Heretofore, except through the pages of mechanical journals of the United States, there has been little literature on this subject, so that all interested will appreciate the fact that such literature is now available.

THE PRACTICAL ENGINEERS' POCKET BOOK, 1907.—Price, leather, gilt, with diary on ruled section paper, 1s. 6d. Published by the Technical Publishing Company, 287 Deansgate, Manchester, Eng.

The present edition of the "Practical Engineers' Pocket Book," marks a record for this publication. An exclusive revision has been made throughout and while deleting several pages of doubtful interest to the general user a considerable number of new notes have been added, among which are boiler setting, steam traps, engine covers, etc. A portion has been considered upon the steam turbine with suitable illustrations and revision and extension made on the engine room accessories, cotton belting, etc. The book as heretofore has had as its aim, the designer and engineer. It is a splendid little publication well worthy the consideration of the engineering profession.

THE DISTILLATION OF ALCOHOL.—By F. B. Wright, a practical hand book. The Distillation of Alcohol from Farm Products, including a process of melting, washing and macerating, fermenting and distilling alcohol from grain, beets, molasses, and the denaturing of alcohol for use in farm engine, automobiles, launch motors, and in heating and lighting, 194 pages, illustrated with diagrams. New York: Spon & Chamberlain.

As the author states, alcohol is a source of power, as a substitute for gasoline, petroleum and kindred hydrocarbines, was hardly known to the generality of Americans, until the passage of the Denaturing Act, by the last Congress. Alcohol then leaped into flame as a substitute for all the various forms of heat, hydrocarbine fuels. This is a timely volume on the subject, and is treated in a manner calculated to give the reader a grasp of the subject under consideration, and to show him the possibilities in this direction, in a manner probably before scarcely considered by the average reader. It shows its actual process of the distillation of alcohol, and its denaturing from a practical and manufacturing view point.

ELECTRICAL POCKET BOOK.—The Practical Engineers' Electrical Pocket Book for 1907. Price, 1s. 6d. net, leather, gilt, with diary on ruled section paper. Technical Publishing Company, 287 Deansgate, Manchester.

Further notes on other departments of engineering have been added to this year's pocket book. Such progress has been made in scientific and practical electricity, that this is not only possible but necessary. In some instances former contents have been amplified. The present edition is in keeping with the high standard of previous years, and is a valuable addition to concise literature and electrical engineering.

Power and Transmission

Steam Gas Electricity Compressed Air Water

AIR-COOLED ELECTRIC DRILLS.

ILLUSTRATIONS given herewith show views and sections of the single motor, two motor and three motor electric air cooled drills manufactured by the Chicago Pneumatic Tool

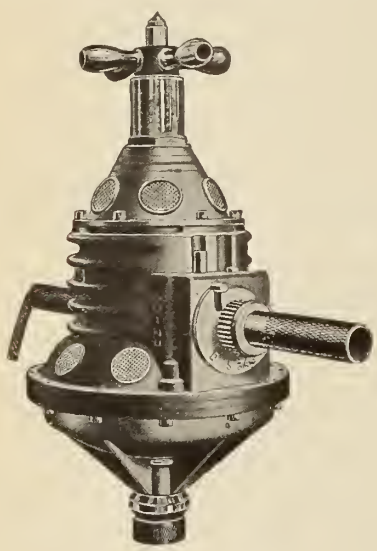


Fig. 1—General View of Air Cooled Drill.

Company, Chicago. The single motor which is adapted to all classes of work for drilling iron and steel up to 1¼ inch in diameter as its name indicates is provided with one revolving electrical element or armature. The armature is of the slotted type, with wound coils of double silk covered magnet wire secured in place by wedges, no binding wire being used. The commutator is built up of hard drawn copper bars, insulated with amber mica, and the commutator sleeve is of machinery steel. Carbon

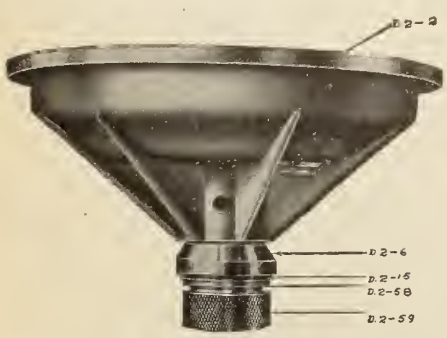

Fig 2—Drill Spindle with Ball Thrust Bearing.

brushes are used. The shaft is of high carbon steel, with the pinion cut as an integral part of it and is hardened and ground at the bearings. Ball bearings of the Hess-Bright type support the armature, provision being made for slight end play.

Machines capable of drilling holes larger than 1¼ in. in diameter are made in two and three motor types, for if one armature were used it would have to be quite large in diameter and the speed would have to be reduced to keep down the peripheral velocity. By the use of two or three small armatures properly geared to the main driving spindle a greater power can be secured for a given weight because the armatures can be run at higher speeds with perfect safety. Figs. 3 and 4 show sectional views of the two and three motor drills, respectively. Since the construction of these drills is somewhat analogous they can be described together.

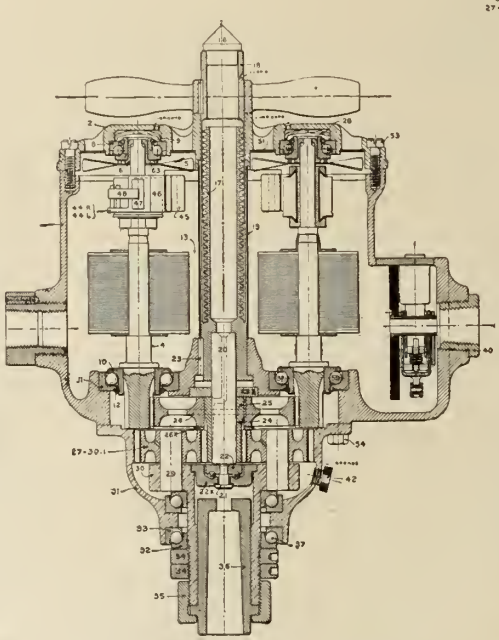

Fig 3—Sectional View of Two-Motor Drill.

Figs. 5 and 6 show the plan arrangement of the armatures and fields which are peculiar to the Duntley drills. The outer casing is of nonmagnetic material.

The fields are compound wound and a very low starting current is required, and at the same time a fairly close speed regulation is obtained. The fans are placed on the upper or commutator ends of the armatures, so that the air is drawn in and forced out at the lower end. The electrical construction of the parts, including the switch, is the same in general as for the single motor drills previously described. The planetary gear arrangement is similar, involving

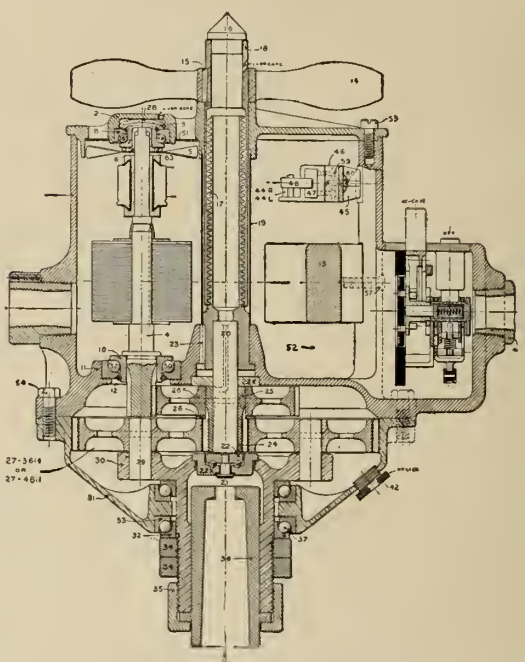

Fig. 4—Sectional View of Three Motor Drill.

only such modifications as are made necessary by the increase in the number of driving pinions.

The two and three motor drills are, as previously stated, adapted for heavy work and are used for drilling in iron or steel up to 2¼ in. and for boiler plate reaming and staybolt tapping. On large holes they have removed 2¼ cu. in. of cast iron per minute with comparative ease.

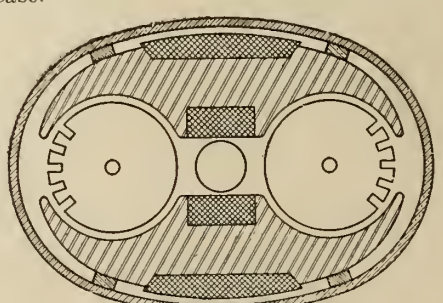

Fig. 5—Two-Motor Armature and Fields.

NEW GAS ENGINE BY-PRODUCT.

IT IS of interest to learn of an invention which has been perfected in Germany where, it is known, all matters connected with the economic utilization of gas power have received,

and are still finding, the most careful attention of engineers. The subject was made public in an address recently made by Herr Hausser before a branch of the Society of German Engineers at Kaiserslautern, says F. E. Junge in Cassier's.

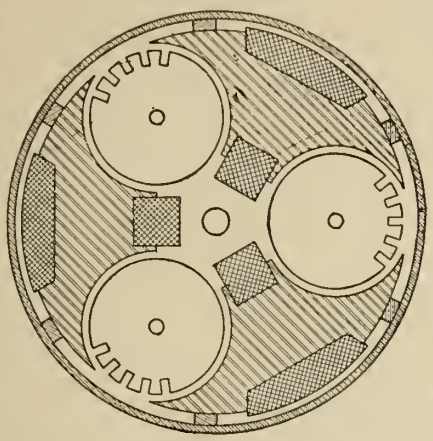

Fig. 6—Plan of Three-Motor Armature and Fields.

His aim is to produce nitric acid through explosive combustion, which, when properly directed, will create temperatures of several thousand degrees Centigrade.

An unusually attractive feature of the invention, and one that is likely to hasten its industrial exploitation, lies in the fact that the principle underlying it is extremely simple and that the process can be carried on by almost any owner of a gas engine and without increasing the initial cost, the operating expenses, the floor space and the complexity of the plant in any but a very slight degree.

It is to be hoped that the problem will commend itself to further examination and test, so that exact information on the commercial possibilities of the new process may soon be available. So far as one can judge at this early stage it does not seem to offer any practical difficulties in its execution. The formation of nitric acid in the engine cylinder can easily be avoided by keeping temperature in cylinder walls and piston above 120 degrees Centigrade, which is the dissociation limit of nitric acid. This, of course, is very easily accomplished.

Fig. 2—Coal Chute and Carrier.

In the evolution of gas power Hausser's invention presents a further important step ahead. The thermal superiority of the gas engine over all its competitors in the field of prime movers has by this time been acknowledged even by its most conservative antagonists, even such as keep only in touch with domestic achievements. Its mechanical efficiency has, by the proper employment of scientific methods of design, reached a level with that of the very best reciprocating steam engines.

In the iron and coal regions, and wherever waste gases of any kind are to be had, and where there is a market for available surplus power, it is the prime mover to be selected for driving blowing engines, rolling mills and pumps, if maximum industrial economy of a heat power plant is to be secured. Elsewhere its radius of action has been largely extended by the perfecting of gas producers, which will gasify the lowest grades of fuel with high efficiency and reliability. The new sphere of application opened up by the utilization of the chemical reaction of its working cycle discloses an outlook for further usefulness which is practically unlimited.

COAL-HANDLING EQUIPMENT.

WITH this issue are given illustrations and descriptions of a Jeffrey coal handling equipment for retail coal yards, which is now in operation at the coal yard of the Vandalia Coal Company at Chicago, Ill.

This system is known as the run-around V bucket combined conveying and elevating type, as will be seen from the general plan number 1, which shows a side, end and plan view.

The coal is carried about ninety feet, horizontally and about forty feet vertically, at the rate of from 50 to 75 tons per hour.

The equipment consists of 750 ton wooden storage pocket, a run-around combined elevator and conveyor, driving machinery, loading chutes, also a power shovel.

The method of operation is about as follows :—The coal is received in cars at one end of the building, it being unloaded from the cars by means of a Jeffrey power shovel and discharged directly into the elevating portion of the machine, which carries it into the upper storage pockets, distributes it the entire length by means of valves that are placed at intermediate points in the upper horizontal section of the coal handling apparatus.

There is an auxiliary storage below the upper pockets, where all of the surplus coal that the upper pockets cannot contain, is stored by means of the same conveying apparatus referred to.

For reclaiming the coal from the lower storage, a tunnel is provided, through

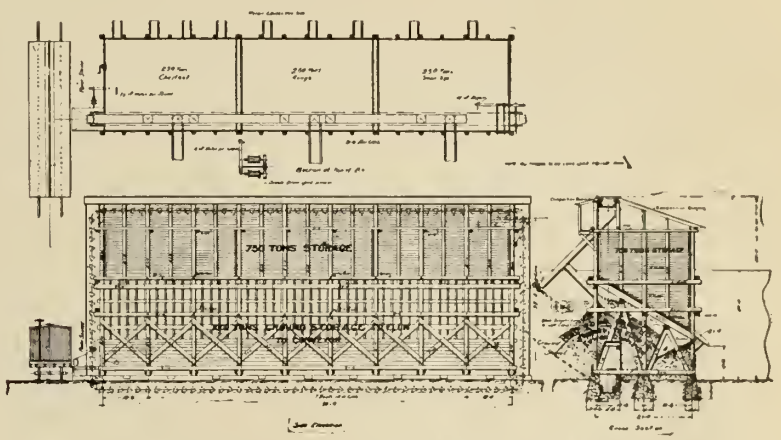

Fig.—1 Section View of Coal Handling Plant.

which the lower or return strand of the conveying apparatus travels. The tunnel is arranged with openings or gates, through which the coal is allowed to flow to the conveyor, and which latter carries it horizontally to one end of the building, elevates it and then carries it back into the upper storage bins. From these latter bins the coal is delivered to wagons by means of special combination coal chutes and screens. The slack from the coal, as it is being loaded into wagons, dropping through the screen and by means of a chute is carried under the storage bins.

Illustration number 2 shows the lower or return strand of the conveying apparatus with the gates and loading chutes ready to receive coal from the lower or auxiliary storage.

Illustration number 3 shows the loading chute and screens delivering coal to wagons.

The coal handling apparatus is con-

structed of two strands of 12 in. pitch steel thimble roller chain with special V buckets, the latter being designed to carry either horizontally or vertically.

The entire plant was installed complete by the Jeffrey Manufacturing Company, of Columbus, O., and is a model of its kind.

Fig 3 - Loading Coal Wagon.

This Company also makes a very complete line of coal handling apparatus for handling both large and small capacities and to suit almost any local conditions and requirements.

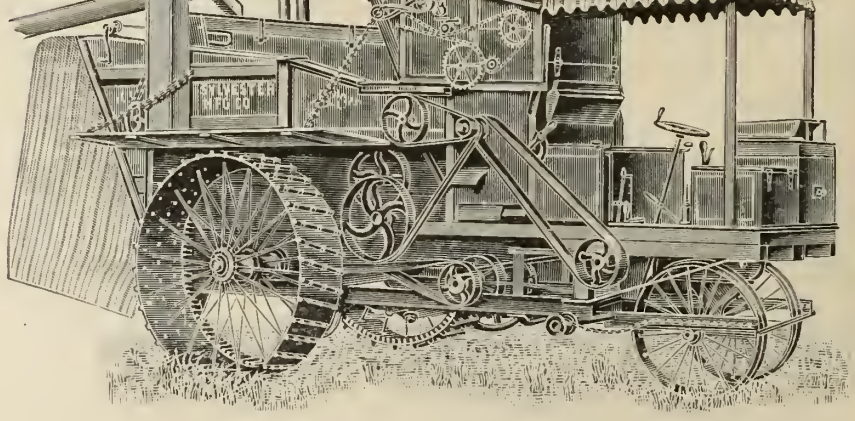
SYLVESTER AUTO THRESHER.

AN illustration is shown herewith of a monster thresher recently completed by the Sylvester Manufacturing Company, Lindsay, Ont., which is the product of three years hard work and constant planning on the part of this company. Mr. Richard Sylvester returned from Manitoba after getting this new machine in operation. In a letter written by N. Wolverton, Superintendent of Manitoba Experimental Farm, Brandon, Man., describing the machine the writer points out that one of these threshing outfits is now in operation on the experimental farm there. He states that a 25 horse power gasoline engine with two cylinders and a separator, are all upon one set of four wheels. The engine is under the separator. The driver sits in front directing the machine, which moves at the rate of about ¾ of a mile an hour through the field of grain, men pitching sheaves from the stooks upon a platform on either side of the separator.

Two men stand on this platform and pitch the sheaves into the self-feeder, which is upon the top and in the centre of the machine. The grain is carried forward over and then under the cylinder, passing backward as in the usual way. The bagger stands on a platform, and when the bag is full ties and throws it on the ground, or the grain may be put in a wagon, which follows. The straw is dropped in a windrow behind the machine.

The machine has threshed barley and oats from the stook in the field, giving excellent satisfaction. It is now at the moment of writing threshing stacks of wheat. When threshing stacks, carriers are put on or a blower may be used. This is the first trial of the machine, which is new from the shops. The few stoppages have been occasioned entirely by adjustments of the machine, such as are incidental to almost any new machine during the first day or two of its trial. When moving, and not threshing, it has a speed of some three miles an hour. No fault can be found with principle involved in the new combination. I think the machine has been put together too hurriedly as they were anxious to get it here in the West before the stook threshing was done. The troubles can be remedied. I am inclined to believe that the machine will be used extensively in the Canadian West. The separator can be removed and the machine used as a traction for plowing or probably to run one of our 12-foot binders. There seems to be no danger from fire. Yesterday there was a very high wind blowing and the steam threshing outfits were compelled to stop work in this section of the country, but this machine continued to work without any difficulty.

The above cut shows the adaptability of this machine to actual conditions in the West. The Sylvester Manufacturing Company have a patent on this machine in Canada and the United States and other patents pending in this country, as well as foreign countries. The Sylvester Manufacturing Company intend to go into the manufacture of this on a large scale in the immediate future.



Sylvester Auto Thresher

TEST BLOWERS.

FOR testing blowers, to measure the volume, pressure and horse-power at pressures of from one to ten pounds per square inch, the following methods and formulae are adopted by the B. F. Sturtevant Co., Hyde Park, Mass

The volume of air discharged from an orifice or pipe is, theoretically, equal to the product of the velocity of the air flowing and the area of the orifice. Hence for the calculation of volume, the velocity is an important factor. To determine the velocity, the Pitot tube is commonly used as shown in the accompanying illustration. It should be inserted in the centre of a straight run of blast pipe within about ten feet of the blower. One part of the Pitot tube transmits the total pressure, which is the sum of the static pressure and the velocity pressure. The other part, in communication with the slats shown in illustration, transmits the static pressure. Evidently the difference is the velocity pressure. Each is connected to a water gauge which should show magnified readings, so that the difference may be accurately determined.

Great care should be exercised in measuring the velocity pressure, and the instruments should be carefully calibrated. In the ordinary blast pipe for conducting air from the blower to the cupola or furnace, the velocity should not exceed two or three thousand feet feet per minute. As this velocity corresponds to a pressure of only about 0.4 inch of water, the measurement requires care, but with good instruments the readings will be accurate enough for all practical purposes.

Volume.

The velocity pressure being known, the volume of free air passing through

the pipe may be determined from the following formula:

$$V = av = \frac{60acP_1}{P}\sqrt{\frac{2gp}{d}},$$

in which

V=the volume of free air in cubic feet per minute,

c=coefficient of Pitot tube, which should be determined for each tube,

a=area of the pipe in square feet,

v=velocity in feet per minute,

2g=64-32,

p=velocity pressure in pounds per square foot; p is the difference between the two pressures observed on the Pitot tube,

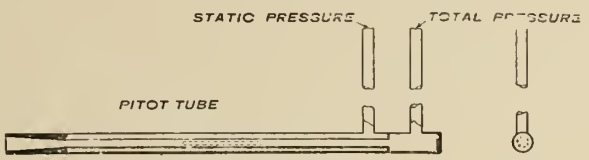


Fig. 1—Section Blowers.

d=density or weight per cubic foot of air at pressure, temperature, and humidity at point of observation,

P_1=absolute pressure of air in the pipe in pounds per square foot,

P=atmospheric pressure in pounds per square foot.

Horse-Power.

Assuming that the air is compressed without cooling, the horse power may be found from the following:

$$H.P. = \frac{VP\left[\left(\frac{P_1}{P}\right)^{\frac{1}{3}} - 1\right]}{11{,}000.}$$

in which

V=volume of free air in cubic feet per minute, hs found above,

P=pressure of the atmosphere or suction pressure (absolute) in pounds per square foot,

P_1=pressure of compression (absolute) in pounds per square foot.

Formulae.

Including the preceding, there are four formulae sometimes used in computing the power required. Values obtained from these formulae have been placed in the form of curves and are shown in the accompanying engraving.

$$(1)\ H.P. = \frac{VP1_e\left(\frac{P}{P}\right)}{33000}$$

$$(2)\ H.P. = \frac{VP\left[\left(\frac{P_1}{P}\right)^{\frac{1}{3}} - 1\right]}{11000}$$

$$(3)\ H.P. = \frac{V(P_1 - P)}{33000}$$

$$(4)\ H.P. = \frac{\text{lbs. per sq. in.} \times V}{200}$$

Formula No. 1 gives the horse power required when the air is cooled during compression as in the ordinary air compressor.

Formula No. 2 which has been explained, is used when it may be assumed that the air is compressed so quickly that it does not have time to cool the atmospheric temperature, as in nearly all blower work.

Formula No. 3, the ordinary "hydraulic" formula is ordinarily used for pressures up to five ounces.

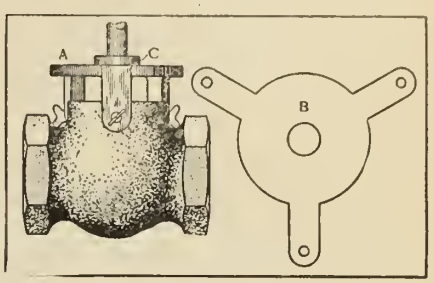
Formula No. 4, is frequently used by makers of positive or rotary blowers for determining the horse power required for operating their machines.

TO REPAIR LEAKY VALVES.

When the brass seats of globe and angle valves become worn so that they leak badly the device here illustrated will be found useful. Remove the bonnet from the valve and clamp on the iron piece, A, which is made by cutting out a piece of sheet iron or steel as at B, and bending the three legs down and tapping to receive the three thumb screws.

A bushing, C, will be required, and should have a hole just large enough to admit the valve stem. By making a number of bushings of different sizes the device may be used on different sized valves.

To grind a valve, replace the bonnet with the jig as shown and put a little emery dust and oil on the valve seat. Then turn the stem, first in one direction and then in the opposite direction, at the time applying vertical pressure to make the emery take hold. Valves ground in this way are just as good as new and unless very badly worn or cut by the steam can be easily and quickly repaired.



Valve Grinding Jig.

PETERBORO COMPANY TO REORGANIZE.

Owing to very heavy losses on some British Columbia contracts and the winding up of the affairs of the Ontario Bank, The Wm. Hamilton Manufacturing Co., of Peterboro, have gone into liquidation. The company has many contracts on hand at the present time, and it has been decided in order to get the necessary capital to carry on their operations and to close up their account with the Ontario Bank, to reorganize. The capital is to be supplied to carry on present contracts and the company is to be reorganized on a permanent basis with larger capital. In the meantime everything is running smoothly in the factory. The 225 men at present employed will all continue as heretofore. The pay roll of this company is $1,200 a month and it is gratifying to the interests of Peterboro that it was not necessary to close down.

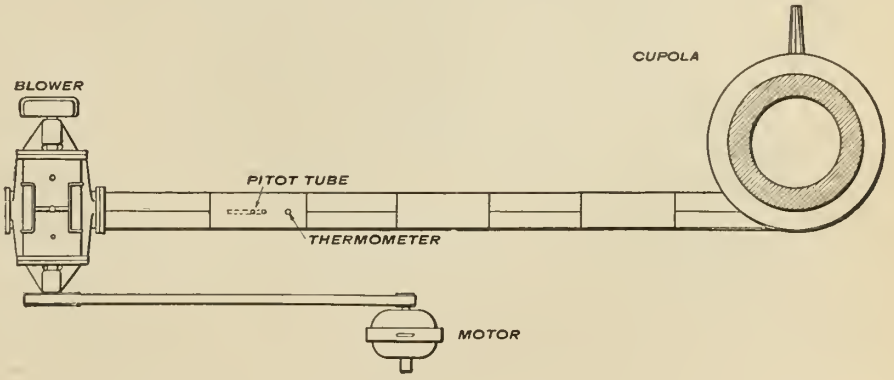


Fig. 2 -Section Blowers

Tenders are being asked for city supplies for Calgary, Alberta, and will be received by H. E. Tillis, city clerk, until the 31st of December, for the following materials: cement, lead pipe, corporation cocks, cast iron water pipe, sewer pipe.

Practical Questions and Answers

Tool Angles.

Ques.—Is there anything special in the hardening of a blanking die, not needed in the hardening of other tools?

Ans.—Great care should be taken in the hardening of a steel die, both in the heating and in the quenching. For the best results a gas furnace should be used, but when that is not obtainable charcoal will answer. To prevent the steel cracking around the screw and dowel holes in the die, they should be plugged with fire clay or asbestos. The dies is heated evenly to a cherry red, and then removed and dipped endwise into slightly warmed water, care being taken that it is dipped in straight and not moved around too much, as that has a tendency to cause the die to warp excessively. To temper the die, it is warmed immediately upon drawing from the water, and is placed upon a piece of cast iron heated red hot, and thus the hardness can be drawn to any desired temper, denoted by the coloring.

Water Annealing.

Ques.—There is a quick process of annealing called the "water annealing" process. Can you explain this process?

Ans.—There are several processes of "water annealing," as the quick processes are called, which give very satisfactory results when done by a practiced hand. Of these processes, the one is probably as good as the other, except that perhaps one person may have better success with one than with another. These quick methods of annealing may come in very handy at times, especially in repair shops, when a certain piece of work is required in a hurry.

One method is to heat the steel slowly to a dull cherry red, then remove it from the fire. As the steel cools down in the air the heat is tried with a piece of softwood, and when the steel has cooled so that the wood ceases to char, it is plunged quickly into an oil bath. This will leave the steel quite soft enough for easy machining.

Another method is to heat the steel slowly to a red heat, then allow it to lie in the ashes of the fire for a few minutes until it becomes almost black, and then drop it into soap suds and allow to cool.

Bevel Gear Cutting in Plain Milling Machine.

Ques.—Will you please explain the usual method of cutting bevel gears in a plain milling machine?

Ans.—The cutter is placed on the spindle of the milling machine in the ordinary way. A plain dividing head is used, splined to the face of the knee plate, which is bolted to the table of the machine. The spline in the knee plate must be cut to correspond with the angle of the gear, and thus there must be a separate spline provided for each angle of gear cut. Should there be a large variety of bevel gears to be cut on the same machine, necessitating a large number of different angles, it would be well topivot to the face of the knee plate a plain graduated plate carrying the dividing head. With this arrangement the head holding the gear blank can be set at any desired angle, and the necessity for cutting splines for each gear angle is obviated. This method of cutting bevel gears necessitates the constant attention of the operator, who is at the same time liable to make a number of errors, the dividing and angle setting being instances. To overcome these objections to using a plain milling machine for cutting spur and bevel gears full automatic gear cutting machines are manufactured, in which all the operations are automatic. Where there is considerab,e gear cutting to be done one of these machines is almost indispensible in modern practice.

Cutting Angle of Tools.

Ques.—Can you give me a short account of the development of the cutting angle for the different styles of cutting tools?

Ans.—In general the cutting angle of a tool depends upon the hardness of the substance to be cut, the softer the substance the smaller can be the cutting angle, but the cutting angle also depends upon the kind of substance. For instance cutting tools for brass are sometimes given negative rake in contrast to the considerable rake given tools designed for cutting steel. The knife is one of the keenest of cutting tools, with a cutting angle rarely exceeding 20 degrees, and in most cases much less than that. Chisels and similar tools for cutting such substances as wood, have a cutting or grinding angle varying from 20 to 25 degrees; and in this class of tools the sharpening facet is to be noticed. This is adopted as a matter of convenience in sharpening. In tools for cutting metals the question of tool angles assumes greater importance than with wood working tools. In these tools the edge is formed by the meeting of the upper and lower facets must be sufficiently wedge-like to penetrate and cut the material, but it must also be sufficiently strong to withstand the force of the cut and also to retain its keenness for a reasonable time. A consideration of this settles the cutting angle. Then so that there may not be undue friction between the tool and the work, and between the chip and that side of the tool against which it presses the end of the tool and the side are cut away, thus bringing other angle considerations into play. Thus the forming of a tool must always include the balancing of these various angles. The angle at the end of the tool is the angle of clearance, and varies in practice from 3 degrees to 15 degrees, and in some instances to 20 degrees. The smaller this angle can be with due regard to the elimination of friction, the better. Probably 10 per cent. is a general average. The angle at the upper face of the tool, known as top rake, governs the cutting action of the tool and also the movement of the severed chip. The greater this angle of rake the better for cutting fibrous metals such as steel and wrought iron, that is if it is not carried beyond the limit when it will dig into the metal and take a very uneven cut. For cast iron and similar crystalline metals this angle must be somewhat smaller than for steel. Then, too, this angle must not be increased too much or the resulting reduction of the angle between the top face and the end face will weaken the tool too much. The angle of rake will range from 35 degrees to 40 degrees for wrought iron or steel, 20 to 25 degrees for cast, and from 10 to 0 degrees for gun metal and similar metals and sometimes tools for brass cutting are given negative rake.

B. T. U. Values.

Would you kindly give me in "Question and Answers" a table of the heat values in B. T. U. of the various commercial grades of kerosene, gasoline, and denaturized alcohol. Also to which of these classes, if any, does the "petrol" used in Europe correspond?

Ans.—Authorities do not all agree as to the heat units contained in liquid hydro-carbons. Kerosene and gasoline may show by different tests as varying considerable in heat units per lb. There are different grades of kerosene and gasoline all of which show a value in heat units different from each other. The petrol used in Europe corresponds with our gasoline. It is known there as petroleum spirits or petrol.

Below is given a table from highly recognized authorities.

	B.T.U. per lb
Gasoline	 11,000
Light petroleum	 17,932
Heavy petroleum	 19,210
Alcohol (pure)	 12,100
Alcohol diluted 20 per cent. by weight with water....	9,620

Machinery Development

Metal Working ***Special Apparatus*** ***Wood Working***

BAND RE-SAW WITH OUTSIDE BEARINGS.

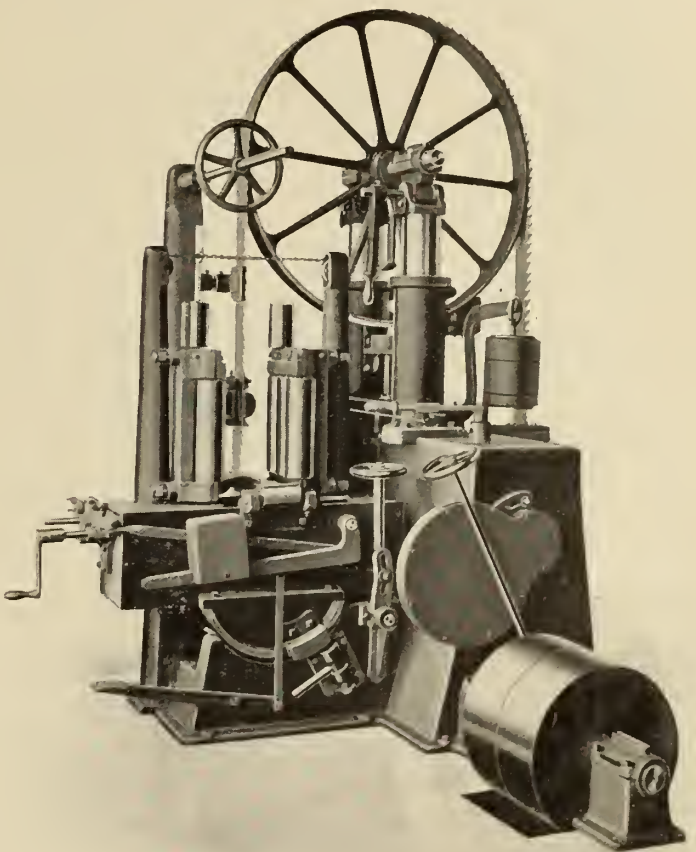
ON examination these machines will be found in advance of any tool of their kind yet produced, in the way of simplicity of construction, elegance of design and adaptability to the work for which they are intended. They embody all the conveniences and attachments that are necessary or desirable for any kind of resawing within the capacity of the machine, and have ample power both on the blade and in the feed works for any reasonable demand, while all parts liable to breakage are reduced to a minimum, and a complete system of numbering and lettering applied and available when repairs are necessary All the adjustments are easily and quickly made, and those necessary for a change from one class of work to another are all made from the operator's position at the working side of the machine.

The frame is box shape, very heavy, with broad base, which, when properly set, prevents all vibration of the machine when running. The bottom spindle is 2 11-16 in. diameter, has four bearings, two on frame, one outside of pulleys, and one outside of saw wheel. The top spindle is 2 5-16 in. diameter with double bearings. The wheels are of a form and dimensions which have been found correct from experience. They hang between heavy vertical columns which are rigidly bolted to the base. The top wheel is raised and lowered by screw, from front or back of machine, and may be adjusted independently when necessary to level the upper spindle. The lower wheel is very heavy, with a solid web in centre. The upper wheel is as light as possible, consistent with strength. The faces of both wheels are accurately finished on their own journals, ground in a special manner after the wheels are placed in position on the machine. Every wheel is tested for running accuracy before being shipped.

The feed works are driven by belt. The arrangement is the most simple possible, every adjustable part being within easy reach of the operator at his position. The rolls are driven by spur and bevel gears, all cased in, making the motion smooth and noiseless even at the fastest speed. Six feed rolls carry the stock to the saw all of which are driven by cut gearing. The right hand rolls are rigid in their boxes, but the left hand rolls are elastic so as to grip uneven stock and hold it firmly up against the rigid rolls, thus making a powerful feed even on very unequally sawn lumber.

The self centering attachment is so arranged that by one movement of a handle the rigid hand roll becomes elastic, so that you have a complete self-centering machine, or by one movement of the handle the right hand roll becomes rigid again. This special feature is our own invention and does away with the use of a wrench to make your machine self-centering. The rolls will tilt from 0 to one inch in six inches, allowing of the successful sawing of clap boards and other bevel work. They are held perfectly rigid without the using of a wrench. The blade is strained by special double acting knife balance levers with detachable weights, the strain being determined by figures on the weights. Blades up to 4 inches wide, 24 feet 6 inches long and from No. 19 to No. 22 gauge may be used. The guides have adjustable hardened steel back, flat roller, with front and side blocks, adjustable on planed ways. The lower guide is adjustable. The upper one is counter weighted and instantly adjustable vertically to the width of the stock. They also furnish a back guide to steady the saw on its upward travel.

The saw runs within an inch of the centre of the back roll. When doing bevel sawing the feed works can be drawn back by one movement of a lever so that the saw cannot strike the rolls while they are tilted. The rolls cannot be tilted until the feed works are drawn back from the saw. Cleaners are provided on both wheels. A packing box is attached to the lower wheel guard, which should be kept filled with oily waste to soften the gum which often



Clark-Demill Band Re-Saw with Outside Bearings.

collects. It is then removed by scrapers fastened to the frame of the machine.

This machine is manufactured by Clark-Demill Co., Hespeler, Ont., from whom further information may be secured.

AUTOMATIC TWO WAY VISE.

DURING these days of wonderful engineering and mechanical accomplishments, the artisan is seldom awed by the birth of some new, economical, ingenious and almost human device. Gradually man is being superseded by his wonderful creations, the machine.

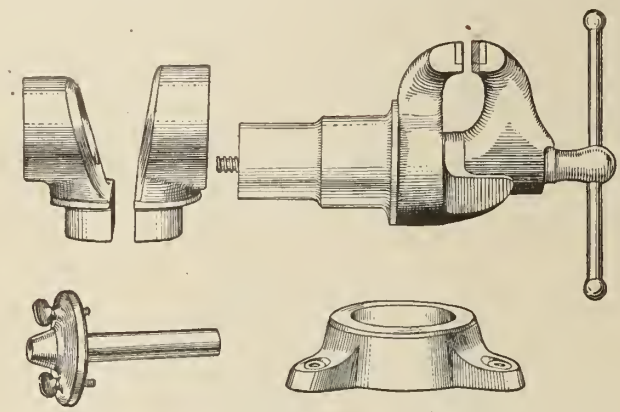


Fig. 1—Simplicity of the Several parts of the "PGH" Double Swivel Vise.

Though the machine shop itself has been revolutionized during the past few years, the vise and anvil have ever remained in their primitive state. But even the vise has reached that stage where it no longer remains the solid chunk of iron capable only of holding in one direction the clamped article between its jaws.

After years of experimental and practical tests, the Pittsburgh double swivel vise, manufactured by the Pittsburgh Automatic Vise and Tool Co. of Pittsburgh, Pa., has been perfected to the highest rung of mechanical ability and ingenuity. Due to its unique design, the vise is capable of turning in any direction, describing any angle of two complete circles. But it does not stop here, for by simply tightening the jaws upon the piece held, both swivels are automatically locked, not to be moved by any human means.

Possessing these marked advantages and original characteristics, it serves not only as a bench vise but as a universal rig for drill presses, planers, shapers and other machines where an article is desired to be held firmly and at any angle. For this purpose an extra base is provided, the vise being easily lifted from one base to the other without the undoing of a screw or bolt.

The vise itself is composed of eight sections or parts, the screw, front and rear jaws, two yokes, demale screw, friction plate and base. The base, which is adapted to be secured to any suitable support, is formed with an annular seat for the body of the vise. The body, consisting of two halves or yokes, provided each with a section or half of a hub seated in the base, are adapted to be slightly tilted in respect to each other and their seat, so that when they are drawn toward each other at their top they will be pressed outward below and thus locked frictionally in the base seat.

The rear jaw is adapted to be rotated about its axis within the body of the vise. It has two diameters, the larger one working in the front yoke and the smaller one in the rear. The friction plate is affixed to the outer extremity of the jaw member. This cap bears against the outer edge of the rear yoke and serves as a support and bearing for the sleeve or nut. This possesses a head which bears against the outside of the friction plate or cap and extends thence through same into the internal bore of the front jaw.

A special bearing alcove is placed on the screw between its head and fixed collar in front jaw, so as to serve as a reliable backing for the collar when the screw is rotated to open the jaws. This also gives the head of the screw a solid bearing against the full stock of the front jaw, therefore nothing to break or give way or become weakened under severe strains or pressure through the action of the screw.

Thus it will be understood that when the screw is tightened it tilts the body sections towards each other and locks them against rotation in the base. The inner jaw member has a splined connection with the inner jaw, thus preventing its rotation in respect thereto.

In accordance with its design the idea of strength is closely adhered to in its complete construction. The round slide bar, which adds phenomenal strength to the weakest portion of all other vises, is made of the finest cast or crucible steel, specially melted and mixed for this purpose. The jaws facings are all of tool steel, while the vise itself is composed of a semi steel. The screw instead of being a common, cast iron head cast upon a malleable or steel rod containing a thread, is a hammered steel forging made for this use alone.

Thus it possesses the distinction of being absolutely dust proof, non slipping and non breakable. Due to its ability of having its jaws revolved in any direction it serves as two vises, for if a jaw smaller than its face is desired, jaws are simply thrown to one side and the side of same used. If a stationary vise is desired the thumb screws on rear can be slightly turned and the two swivels tightly locked. By this means any desired friction can be obtained.

The single swivel vise, although possessing but one movement, is also a very marked advancement in vise construction. Unlike any other vise it is automatically locked by tightening on

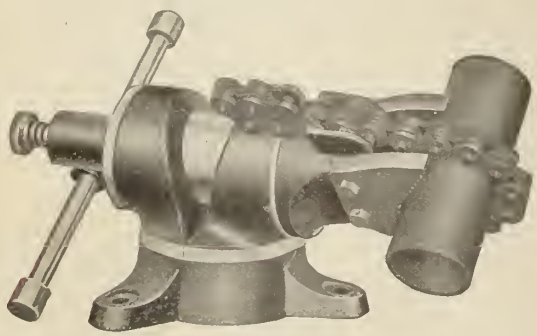

Fig. 2—"PGH" Double Swivel Pipe Vise.

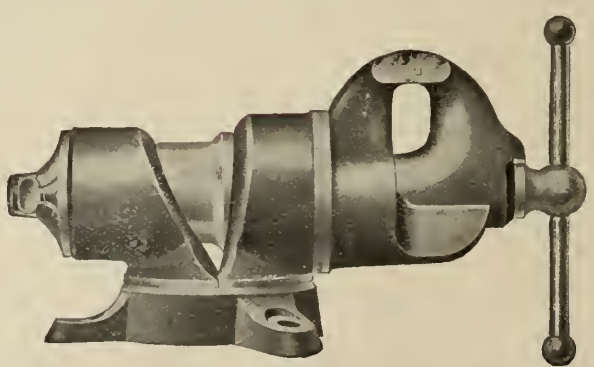

Fig. 3—"PGH" Double Swivel Vise.

the piece in the jaws. No levers, pins, screws or other "in the way" appliances. By lifting it from the base, the vise can readily be carried anywhere. The vise consists of but five parts, the rear and front jaws, screw, base and

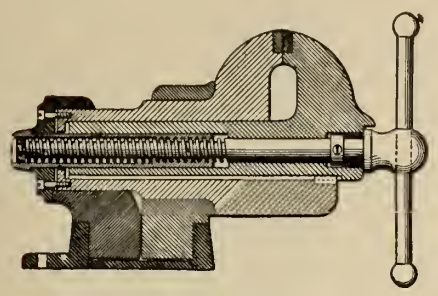

Fig. 4 Sectional View of "PGH" Double Swivel Vise.

locking dog. The latter is so constructed as to permit the screw to pass through its upper extremity. It is pivoted near its bottom upon an alloy steel bar supported by the base. Thus when the jaws are tightened upon an object the screw draws the dog towards them which naturally throws its bottom out against the walls of the base, thus locking it firmly.

In conformity with the originality and usefulness of the previously described tools, the pipe attachment for the single swivel vise, deserves mentioning. Unlike any other vise, the inventors have placed this important attachment on the rear end of the slide bar, out of the way at all times of the operator, the pipe jaws never interfering with the reception of work in the vise jaws proper. It consists of a tool steel attachment, milled perfectly to size, the two sides straddling the end of the slide bar. These are held in place by a bolt. A double linked chain, the pivot pins of which project beyond the sides of the links at each side, is attached at one end by a lug or pin to the body of the vise, below the slide bar. By placing the tube or pipe in position, the chain is brought around it and fastened on the lugs on the upper portion of the attachment. The screw is then given

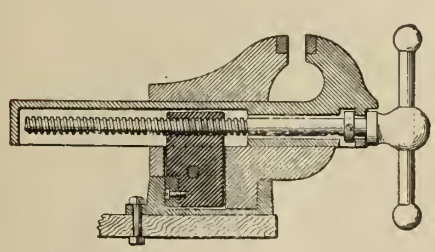

Fig. 5—Sectional View of "PGH" Single Swivel Pipe Vise

a half turn which throws the draw bar back thus tightening the chain upon the pipe and at the same time locking the swivel movement. Its great advantages can readily be understood and appreciated by all mechanics. The necessity of opening the jaws sufficiently wide for the reception of the pipe is done away with as the length of the chain is sufficient to engage the pipe regardless of the position of the jaws. The range of sizes are also increased 100 per cent. over other combination pipe vises.

BENCH POWER PRESS.

HAVING had many enquiries for a bench power press that would do a large range of stamping work similar to what was formerly done in foot presses. W. H. Banfield & Sons, 120 Adelaide Street West, Toronto, have specially designed and built the power press shown in the accompanying illustration. The machine is particularly adapted for operating small cutting, perforating and forming dies, such as are extensively used in the manufacture of tinware, brass goods, burners, jewelry, pocket book trimmings, buttons, etc.

The total weight of this press is 425 pounds and in designing it special attention was given so as to get a strong, compact, and solid frame and not to interfere with a die space of considerable size. The following dimensions will give one an idea of the size and capacity of this press: Opening in the bed 3¾ in. by 4¾ in.; Width of opening in back 5½ in.; Distance back from centre of slide 4¼ in.; And from bed to the slide ½ in.; Adjustment of slide 1½ in.; Distance between the gibs 5½in.; Diameter and face of balance wheel 17 in. by 2¾ in.; Weight of balance wheel 76 pounds; Speed of balance wheel, per minute, 150 to 200 revolutions; Size of bolster plate is 8 in. by 9½ in., by 1¼ in. thick and has a 2½ inch round hole; Height to the centre of shaft 27½ in.; Height over all 36 in. The general design of this press is similar to the larger sizes of the best American make of presses, and is fitted with a right and left hand adjusting nut and a Stiles instantaneous clutch. The press can be easily and quickly adjusted from upright to incline position by simply loosening the clamp screws.

The combination of first-class workmanship and the best material obtainable make these presses of the greatest durability, accuracy and strength.

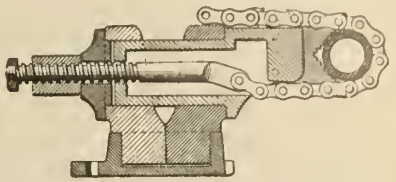

Fig. 6 Sectional View of "PGH" Double Swivel Pipe Vise.

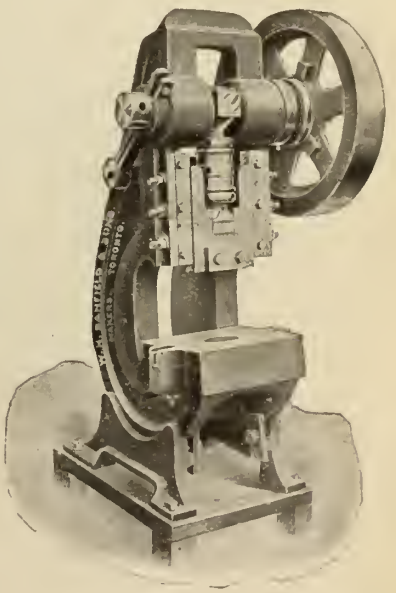
SAW TOOTH NOTCHING PRESS.

FOR rapidly cutting teeth of circular disc saws, the machine shown in the accompanying illustration has recently been designed by the E. W. Bliss Company, Adams Street, Brooklyn, N.Y. A sample of the work done in the machine is shown on the floor. The machine is adapted for cutting the teeth of various sizes of saws of different diameters, and embodies several new and important features.

After the dies have been set and the press adjusted for the work, the operation is as follows: A plain blank is

Fig. 7—"PGH" Single Swivel Vise with Patented Pipe Attachment.

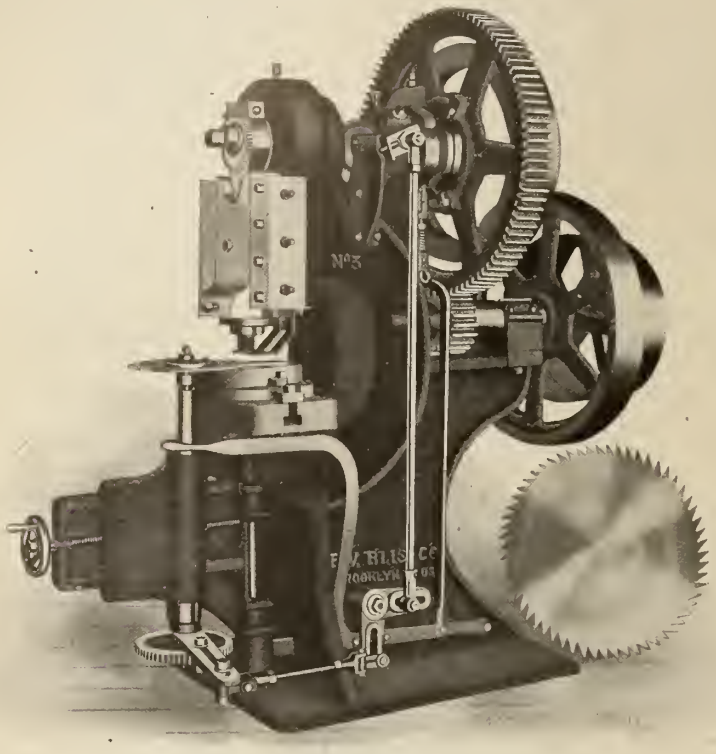
clamped between two discs which are fastened to the revolving spindle in



Banfield Bench Power Press

front of the bed of the press. This spindle is rotated by a ratchet wheel

located near the floor. The ratchet is actuated by a series of levers and cranks by a pair of bevel gears on the main shaft. The long vertical connecting rod has an adjusting screw for altering its throw, so that it may be accurately set for spacing the saw teeth to the required pitch. Approximate settings may be obtained by adjusting the end of the connecting rods in the slotted bell crank and pawl lever, the final adjustment being made by means of the screw already referred to. Depressing the hand levers sets the machine in operation, causing the saw disc to revolve, and the punch slide to descend, cutting a tooth at each stroke of the machine.



Bliss Saw Tooth Notching Press.

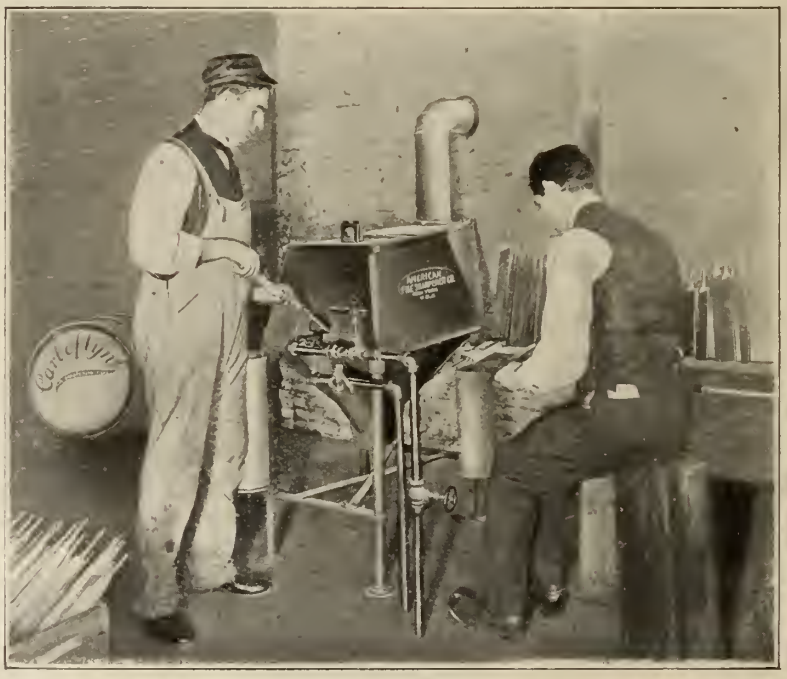
A particularly desirable feature of the machine is the ease with which its setting may be altered from one size disc to another. Heretofore, it has been necessary to remove a considerable part of the mechanism to change the indexing device. In this machine the indexing device is placed at the extreme lower end of the spindle where it can be easily removed by taking off one nut and a washer. To accommodate a different size disc, the spindle carrier is moved from or toward the punch by the hand wheel. The spindle carrier slides along a hinged table so that the teeth of the saw may be punched at the proper rake or angle. The table is secured in position by a clamping bolt in the fixture just below the lower die bed, engaged in the slot of a bracket which is bolted to the table. The slots in the levers of the feeding mechanism are made use of to compensate for the swinging of the table.

The machine will cut teeth on discs of eight to twenty-four inches in diameter and will cut from the largest teeth to sixteen to the inch. The die and punch holders also have adjustments for setting them at any desired angle, making it possible to set the machine at practically any angle required in saw tooth punching of this class.

The machine is so arranged that saws of small diameters and of light gauge may be cut with the press driven as a flywheel press by placing the belt on the pulley rim which is fastened to the main gear. The gear in this case acts as a flywheel and the pinion and regular driving pulley and flywheel are thrown out of mesh. With the first arrangement the press runs at 80 strokes per minute and when geared at 40 strokes per minute.

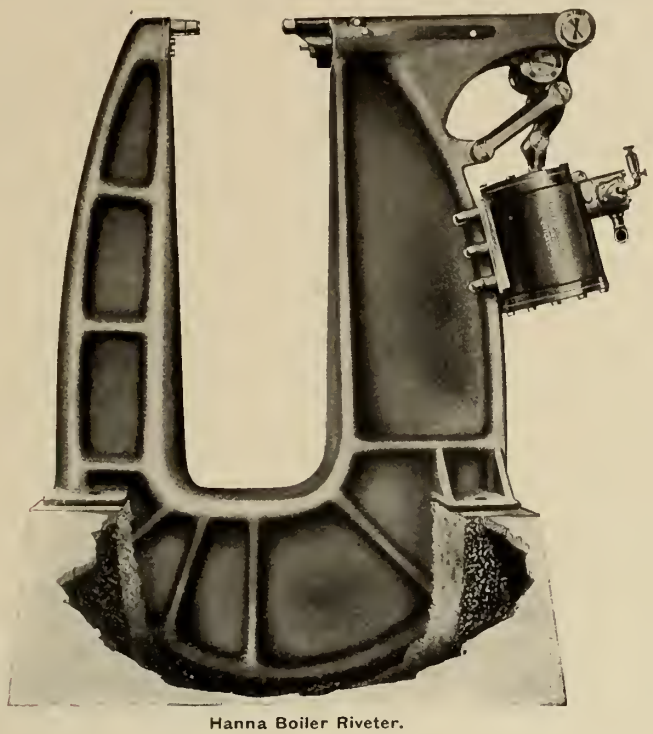
FILE SHARPENING MACHINE.

THE American File Sharpening Co., 296 Broadway, New York, are placing on the market a machine for restoring worn out files to their original cutting edge. The illustration herewith shows the construction of the machine in operation. This machine can be operated by means of steam alone or a combination of steam and air can be used, the cut shows the air attachments. While it will operate successfully with 80 or 90 lbs. of steam the rapidity of doing its work is increased with 100 to 120 lbs. of steam. An abrasive known as carbo-flint is used in its operation and no sand blast process is used. An inexperienced workman may be taught the use of this machine in the course of a few hours. Its range includes everything from fine imported files to the coarse rasp, as well as hack saw blades. The capacity is from 200 to 300 files per day according to the size and condition in which they are received for re-sharpening. No acid or chemicals of any nature are used and the temper of the file is not drawn.



File Sharpening Machine.

Further information regarding these machines may be had from the American File Sharpener Co., 296 Broadway, New York.



Hanna Boiler Riveter.

HANNA BOILER RIVETTER.

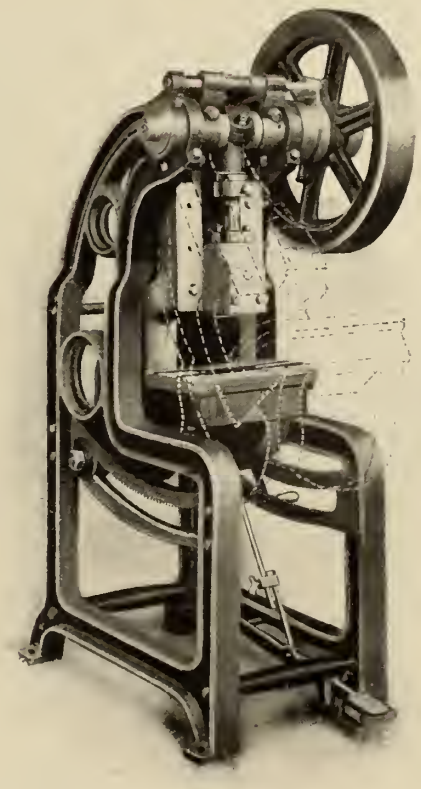
PNEUMATIC boiler and tank riveters have been developed by the Hanna Engineering Works, Chicago Ill., as shown in the accompanying illustration. This riveter has a stake of 21 inches diameter with 75½ inches clearance. This style of machine was designed for driving rivets in small diameter tanks and sheets and is made in any reasonable reach and gap and for 50, 70, 80 and 100 tons pressure, capacity limited only by handling and healing arrangements. The size of stake of course, will vary with the length of reach and pressure to be exerted. When desired it is also furnished with flush top arrangements for doing close flanging work. This machine may be operated either portable or stationary in any position. The catalogue No. 3 of the Hanna Engineering Works will show by graphical illustrations the manner in which they are enabled to drive absolutely tight rivets with each and every stroke. It will be mailed upon request to all interested.

NEW SAFETY AUTOMATIC PRESS.

A NEW safety automatic inclinable press has been invented and is now being manufactured by Jas. B. Hall & Son, 112 Adelaide St., Toronto. This press is shown in the accompanying illustration. The two important features of the press are the safety automatic clutch and the fact that it is inclinable. This safety automatic clutch allows but one stroke of the press for each depression of the foot pedal. To obtain another stroke of the press the foot pedal must be released and again pressed down. The object of this feature is to reduce to a minimum the liability of accident to the operator.

The body of the press swings from the centre of the crank shaft bearings and does not affect the position of the flywheel or belt, and thus the press may be set while in motion. This feature is more conducive to perfect setting of dies in combination work.

Another feature of the press is the device for setting the ram to the desired height, it being a simple and secure device.



New Safety Automatic Press.

INTERESTING JAIL BREAKING TEST.

AN expert local steel and iron worker of Vicksburg, employed by the county to test the steel cages in the new county jail there has been able to find his way through the "unsawable" bars. This man, John Christian has been engaged on a contract with the Warren county to make an actual test as to the strength of the steel bars making the cages in the new jail. He has been able to saw through an inch of wrought steel with what is known as the ordinary No. 250 12 inch L. S. Starrett saw made in Athol, Mass. This test was made in the presence of the president of the Board of County Supervisors. It came as somewhat of a surprise to the county officials, as they had been formerly convinced by the many testimonials of the St. Louis firm that furnishes these bars that they were positively tool proof. As four cages of this kind are to go under a separate contract of something over $16,000.00 the company will have to come again and make a stronger bar for these cages.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

WHITNEY CHAINS.—A number of bulletins have recently been issued by the Whitney Manufacturing Company, Hartford, Conn., describing various apparatus and paying special attention to the chains manufactured by this company. They include roller chains, on which special information is given in one of the bulletins. Other bulletins are devoted to keys and cutters, water tool grinder, milling machines, and tapping devices.

ROCKWELL FUEL OIL.—An 18-page catalogues issued by this company is devoted to fuel oil burning appliances as manufactured by the Rockwell Engineering Company, 26 Cortlandt St., New York, engineers and contractors. Some of their bulletins are devoted to their flue welding furnace, Rockwell heating machines, annealing and hardening furnace, metal melting furnace, brazing furnaces and pot furnaces.

THE HIGLEY METAL SAW.—A high-class catalogue of 47 -pages, devoted to metal saws and grinders as manufactured by the Higley Machine Company, New York. The illustrations of the various machines are of a superior order and interesting information is given concerning the same.

HORIZONTAL BORING MACHINES.—These are described as the tools for accurate and quick boring in the catalogue of the Binsse Machine Company, Newark, N.J. Illustrations are given showing the various adaptations of the work of this machine. 40 pages, 5 by 7¾.

FLEXIBLE TRANSMISSION. — The Coates Clipper Manufacturing Company, Worcester, Mass., are manufacturers of the Coates unite link flexible shaft. The many uses to which this shafting may be applied are mentioned and the illustrations of same given. Other Coates apparatus is described in this catalogue of 28 pages.

E. W. BLISS Co.—A 578 page cloth bound catalogue describes and illustrates very many designs of presses, dies and special machinery built by E. W. Bliss Company, Brooklyn, N.Y. Some fine half-tone engravings at the front illustrate the works of this company, both interior and exterior. The presses manufactured by E. W. Bliss, are known throughout the metal manufacturing world and have an excellent reputation wherever used. Many of these are to-day in operation in Canada with excellent results.

FROST & WOOD CALENDAR.—The annual calendar of the Frost & Wood Company, Smith's Falls, Ont., is to hand. As is usual with this firm a handsome calendar has been produced that will be an attraction to any office.

BALL BEARING JACKS.—A. O. Norton, 286 Congress Street, Boston, Canadian branch, Coaticook, Que., issue a catalogue devoted to special ball bearing and track jacks. These are handled in Canada by W. H. C. Musson & Co., Montreal, Que., from whom further information regarding these is obtainable.

HYDRO-ELECTRIC REPORT. — The third report of the Hydro-Eleetric Power Commission of the Province of Ontario is devoted to the Lake Huron and Georgian Bay Districts. It contains maps of these parts showing the location of water powers and adjacent industrial centres. As in the case with previous reports, data regarding the power required in the different localities and the cost of various lines has been calculated and tabulated. This is of particular interest to residents in this district as well as to all parts of Ontario.

FRANKLIN AIR COMPRESSORS.—The Chicago Pneumatic Tool Company's latest catalogue is devoted exclusively to a detailed description of the Franklin air compressors manufactured at their Franklin plant. Constructive principles are described in detail and information not hitherto published is given relative to several new designs of compressors, including the Corliss motor driven gas engine, and new pattern compressors of larger capacities. Considerable space is devoted to pumping by compressors describing the new Chicago water lathe. Numerous interesting tables and formulaes complete the contents of this valuable contribution to compressed air literature, which should be in the hands of all interested in the subject. The catalogue contains 116 pages, 6 x 9. Is mailed free on application to all interested by applying to this company.

SHARP FILES.—The catalogue on sharp files issued by the American File Company, of New York, which appeals to the people with the heading: Don't throw away your dull files, and goes on to illustrate and fully describe the new machine manufactured by them, also their Hercules folding ladder, which is set forth as useful for every purpose, such as painting, fire escapes, etc.

WIRE NAIL MACHINERY.—National Wire Nail Machinery is the subject of Bulletin No. 30, issued by the National Machinery Company, Tiffin, Ohio; a high grade of coated paper is used in this bulletin, on which the excellent engravings show to particular advantage. A line of samples of the nails made by these machines is also shown. Some of the illustrations give views of various parts of the mechanism. This bulletin should be in the hands of all interested in wire nail machinery.

SPLIT FRICTION CLUTCHES.—The Dodge Manufacturing Company, of Canada, have just issued a booklet describing Dodge Split Friction Clutches. This clutch is placed in position on the shaft without interference with the remainder of the equipment, and repairs and renewals are similarly facilitated. The price list is given. Cut off couplings are also described and illustrated.

HANNA RIVETER.—A thirty-four page catalogue, issued by the Hanna Engineering Works, Chicago. The various types are illustrated on half-tone paper, the pleasing effect being the interplacing of heavier stock containing the descriptive matter, the various riveters described include portable riveters, lever riveters, and riveting supplies. Illustrations of the various parts are also included.

HOWE SCALES.—A compact catalogue 4 x 6 inches, containing 175 pages, is devoted to the Howe scale manufactured by the Howe Scale Company, Rutland, Vermont. Besides platform scales and counter scales, heavier styles are described, including suspension scales for coal hoppers, bullock scales, car scales, transportation scales, railroad contract scales, etc.

MURCHEY MACHINE & TOOL CO.—Corner Fourth and Potter Streets, Detroit, Michigan, issue a catalogue devoted to the Murchey patent automatic collapsing taps, nipple and pipe thread machine, roller pipe cutters, tapping machines, etc. One of their important tapping machines is described in the machinery development department of this issue.

GAS DRIVEN ELECTRIC POWER.—A neat booklet containing the reprint of an article of the above title read before the Engineers' Society of Western Pennsylvania by J. R. Bibbins. This article deals with a Westinghouse gas engine installation at the power house of the Warren & Jamestown street railway. This article is an exceptionally interesting one; and the booklet can be obtained from the Westinghouse company's publishing department, Pittsburg, Pa.

PERSONAL MENTION

K. L. Aitken, consulting electrical engineer, has moved to larger quarters in 1003 Traders Bank Building, Toronto.

A Rising Contractor and Manufacturer.

Men about town, in Montreal, have, within the past few months, had frequent introduction to the firm name of "J. W. Harris Company, Limited," which has appeared in connection with so many large contracts for building and excavation. The president of this growing company, who are the patentees and manufacturers of the J. W. Harris Excavators and Trenching Machines, is J. W. Harris, whose likeness is presented on this page. Mr. Harris was born at Buffalo, N.Y., October, 20th, 1865, his mother being of French birth, and his father of Scotch descent. He was educated in Montreal at the Jacques Car-

J. W. HARRIS, Montreal.

tier Normal School, and learned his trade as plumber and steamfitter, with Brodeen & Lessard. In 1892 he became a partner in the firm of Lessard & Harris, general contractors, and undertook some large contracts, notably the C.P.R. "Angus 'shops," at Montreal. Mr. Harris has made remarkable progress in the commercial world within the past few years. In addition to being President and General Manager of the J. W. Harris Company, Limited, he is President of the Municipal Trenching Company, Vice-President of the Ross & Harris Company, railway contractors, Vice-President of the Montreal & Southern Counties Railway, President of the St. Lawrence Floating & Wrecking Company, and Director and Chairman of the Executive Committee of the Murray Bay Lumber & Pulp Company. Mr. Harris is a member of the Montreal Board of Trade and member of the Council, Chambre de Commerce. He is also a leading member of the Montreal Building Exchange.

Sales Manager Weds.

The marriage of Mr. N. S. Braden, sales manager of the Canadian Westinghouse Company, Hamilton, to Miss Mabel Greening, second daughter of Mr. and Mrs. S. O. Greening, of the same city, took place in the James Street Baptist Church there on Thursday, Nov. 29th. Miss Hattie Greening, sister of the bride, was maid of honor, and the bridesmaids were Miss Edna Greening, sister of the bride, Miss Gladys Zimmerman, of Hamilton, and Miss Agnes Ellis, of Hespeler. The groomsman was Mr. W. G. Cameron, of Cleveland, and Messrs. William Prince, Cleveland, H. D. Shute, Pittsburg, William Greening, Toronto, and H. M. Bostwick and Stuart MacDonald, of Hamilton, were the ushers. The gift of the groom to the bridesmaids were gold enameled pins, and to the groomsman and ushers gold enameled pearl stick pins. The ornaments of the bride included a magnificent twin setting diamond ring, also the gift of the groom. A reception was held at "Fonthill," the residence of the bride's parents, which was artistically decorated for the occasion. Gifts almost innumerable were received by the bride, including a sterling tea service from the Westinghouse staff at Montreal and a case of silver from the Pittsburg Westinghouse staff. Mr. and Mrs. Braden left in the evening for the South on an extended trip and on their return will reside at 134 Duke Street, Hamilton. The newly married couple have hearty congratulations and the best wishes of Canadian Machinery.

COMPANIES INCORPORATED.

Douglas Bros. Company, Toronto, have been incorporated, as contractors for roofing and sheet metal work, with a share capital of $100,000, provisional directors of the company will be, T. Douglas, E. Douglas and G. R. Douglas, of Toronto.

The General Metal Foundry and Machinery Co., Montreal; capital, $199,900; purpose, to carry on the business of engineers, machinists boilermakers etc. The directors are: M. E. Lymburner, Sault Ste. Marie; L. L. Lymburner, J. E. Mathews, J. P. Mathews, all of Montreal.

A company is formed at Brockville for the purpose of manufacturing tools of all kinds. Also galvanizing and plating metals under the name of Canadian Billings & Spencer, with a share capital of $200,000. J. T. Gardner, J. H. Botsford and W. S. Buell of Brockville are directors of the company.

The General Metal Foundry and Machinery Company has been incorporated with a share capital of $199,000 with head office at Montreal. Directors of the company will be M. E. Lymburner, St. Agathe, Que., L. M. Lymburner, H. N. Lymburner, J. E. Mathews and J. B. Mathieu of Montreal and A. St. George of St. Paul, Que.

The W. J. Kemp Company have been incorporated with a share capital of $300,000, with head office at Stratford, for the purpose of manufacturing and dealing in agricultural and other implements and machinery. Provisional directors of the company are: W. J. Kemp, Stratford, N. J. Kemp and J. S. Lewis of Newark Valley, N.Y.

The Vulcan Company have been incorporated with a share capital of $100,000, and head office at London, Ontario, to manufacture furnaces, stoves, and other heating and cooking appliances. The provisional directors of the company will be: R. W. Shaw, E. W. M. Flock, and F. G. Mitchell, of London.

The Dominion Asbestos Company has been incorporated with a total capital stock of $500,000 for the purpose of developing mines, also to carry on business as electricians with head office at Montreal. Directors of the company will be H. H. Robertson, Boston, Mass., R. T. Hopper, F. H. Markey, W. W. Skinner and R. G. Grant, Montreal.

The Canadian Hardware and Manufacturing Company, has been incorporated with a share capital of $50,000, with heal office at Toronto, to carry on business as machinists, engineers, foundrymen, fitters, and smiths. The provisional directors will be: W. S. Harrison, W. H. Alderson, S. M. Linn, and W. J. McManus, of Toronto.

The Dominion Heating and Ventilating Company have been incorporated with a share capital of $40,000, to manufacture heating and ventilating systems, also iron, brass, aluminum, etc., machinery and casting, with head office in Hespeler. The provisional directors of the company will be, E. McNally, M. A. Secord and L. Reid of Galt.

C. Ormsby & Company, Toronto, has been incorporated, with a share capital of $50,000, for the purpose of manufacturing, metal roofing, sheeting, and metal building materials, also to engage in building operations, as contractors. The provisional directors of the company will be: C. E. Ormsby, W. J. Cook, and G. A. Graham, of Toronto.

The Percival Plow and Stove Company have been incorporated with a share capital of $200,000 for the purpose of manufacturing agricultural implements, stoves, and furnaces, with head office at Merriekville, Ont. Provisional directors of the company are: John B. Waddell, T. F. McKimm of Smith's Falls, Eli Stiekney, R. C. Percival of Merriekville and W. R. Morris, Peterborough.

INDUSTRIAL PROGRESS

MACHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

Another nitro-glycerine factory has been started at Petrolea.

Anton Bery has accepted a site for his proposed factory at Guelph.

The Torbrook iron mines, Halifax, N.S., have been sold for $250,000.

The Dominion Dash Company, Walkerville, Ont., will erect a new building there.

Ratepayers of Elmira, Ont., carried a by-law to expend $25,000 for waterworks.

Building permits issued in Winnipeg for the month of November total about $400,000.

The Gurney Tilden Co., of Hamilton, Ont., will erect a big warehouse at Edmonton.

The Sydney Cement Company, Sydney, N.S., will operate their plant all winter.

Wingham is after a $15,000 grant from Andrew Carnegie for a Public Library building.

The Marine Iron works, of Victoria, B.C., was damaged by fire to the extent of $5,000.

A new Presbyterian church will be erected in St. John, N. B., at the cost of $50,000.

Work has been started on the new warehouse for McClary Mfg. Co., in St. John, N.B.

Building permits issued in Toronto from December 8, to 15, amounted to over $116,000.

A new fire station is to be built in Winnipeg for the protection of C.P.R. shop's district.

The Schaake Machine Works, New Westminster, B.C., will spend $50,000 erecting new machine shops.

The Stevens Company of Galt, are to erect a new moulding plant in connection with other workshops.

Willian Gray & Company, Carriage manufacturers of Chatham, will build a $100,000 factory in Winnipeg.

The Atikokan Iron Company's blast furnace plant at Port Arthur will be ready in about six weeks time.

The village of Dublin is to be lighted by an acetylene gas plant now being installed by the Kurtz Company.

The contract for the new fire hall on Adelaide St., Toronto, was awarded last week for the sum of $59,535.

Fire did damage to the extent of $200 at the Ontario Tack Company's factory in Hamilton a few days ago.

Discoveries of tin deposits have been found on an island within 100 miles of Vancouver, by a German prospector.

The Canadian Ethinite Company of Niagara Falls, Ont., have commenced the construction of their factory building.

The F. B. Wood Company, Hamilton, will erect a large addition to their factory, making it twice its original size.

A brick and pulp mill will start at Prince Albert, Sask., it is expected that $100,000 will be invested by each concern.

The new nine storey building erected for the C. W. Lindsay & Company, of Montreal, was formally opened last week.

The United States Mica & Milling Co. have made application for land in East Toronto for a manufacturing plant.

A new company with a capital stock of $50,000, will be formed in St. John, N.B., for the manufacture of hardwood flooring.

Every five days a new engine is turned out from the works of the Kingston Locomotive Co. Seven hundred men are employed.

John Glenn, Dungannon, is completing a machine which is an invention of his own, for the making of small cement tile for farm use.

A firm from Hartford, Conn., is negotiating with the town of Guelph with a view of establishing a forge works there.

The Manitoba Cartage and Warehousing Co., are applying for authority to increase their capital stock from $150,000 to $250,000.

Jones Bros. & Company, manufacturers of show cases, etc., Toronto, have increased their capital stock from $60,000 to $200,000.

A permit has been issued the Gerhard Heintzman Piano Company for the building of an addition to their Toronto factory, to cost $10,000.

The Phillips Manufacturing Company, Toronto, will erect a new two storey factory building containing 132,000 square feet of floor space.

The British Columbia Tie and Lumber Company's lumber mill at Prince Rupert, will have a capacity of 70,000 feet of lumber per day.

The Hamilton Bridge Company have secured the contract for all the iron work in the new C.P.R. bridge, across the Belly river, Lethbridge, Sask.

The Northern Navigation Company, which owned the steamer Monarch, recently lost on Isle Royale, will build a duplicate of their steamer Huronic.

The Macdonald Manufacturing Company, Toronto, have secured a permit for the building of a four storey addition to their factory, to cost $18,000.

The Dominion Carriage Company, Truro, N.S., has been organized with a $250,000 capital, and will erect buildings in the spring, employing 100 men.

Jenkins Bros., of New York, have ordered a 150 horse-power engine from the Robb Engineering Company for the new factory they are building in Montreal.

The large planing mill of Robertson & Haeketts, at Granville, B.C., was totally destroyed by fire, loss being estimatted at $40,000, partially covered by insuranee.

The Robb Engineering Co. has received an order from the Allis-Chalmers-Bullock Co. for three 125 horse-power engines for the C.P.R. Hotel, Vancouver, B.C.

An English Cordage Company are making arrangements for the erection of a large warehouse in Brandon, Man., to be used as a distributing centre in the West.

A by-law has been prepared by the town council of Welland, Ont., to fix the assessment of the Roberlson Machinery Co., of that place, at $1,000 for ten years.

A warehouse will be built at Saskatoon for the Manson, Campbell Co. and the Chatham Carriage Works, to be used as a distributing centre for their vehicles in the West.

The Lethbridge coal strike is at last over, the company granting the requests of the men. Work was started immediately as there is a great scarcity of coal in the West.

The Shaake Machine Works, of New Westminster, B.C., are making a large addition to their works to keep pace with the machine and iron work industry of that city.

Fire supposed to have originated from a workman's torch destroyed the C. N. R. boiler shop in Winnipeg and much valuable machinery. The loss is between $60,000 and $100,000.

Tenders are being asked for the various works required in the erection and completion of a grand stand also of a hortieultural building on the Exhibition Grounds, Toronto.

The Grand Trunk Railway System and Geo. Okley & Sons, Toronto, have both received recently transfer and traveling trains from the Smart-Turner Machine Co., Hamillon.

The Vancouver Portland Cement Company are preparing to enlarge their premises, so as to have an output of 1,000 barrels per day. Their capacity is now 650 barrels per day.

A large iron foundry and machine shop is to be erected at Anaconda, B.C. Messrs. B. A. Isaacs and R. W. Hinton, of the Nelson Iron Works are promoters of the enterprise.

The expenditure of a quarter of a million dollars at Stratford, by the G.

T.R., for the erection of a new station, and extending its locomotive repair workshops, has been decided upon.

O. P. Letchworth, expresses the opinion that the Brantford plant of the Pratt & Letchworth Company, will be increased rather than reduced, despite the fact that his company is about to have another plant in Montreal.

The Lufkin Rule Co., of Saginaw, Mich., has secured a site in Windsor, and will build a Canadian factory early next spring. Meanwhile the firm has secured temporary quarters and will begin building operations at once.

The Dominion Iron & Steel Company's rail mill at Sydney, which has been closed down for several weeks, has resumed operations. There is a sufficient stock of machinery on hand to keep the mill running double-shifted.

The National Cement Company of Durham, is in a very flourishing condition, having turned out 1,110 barrels per day all summer. They will construct a building for storage purposes, which will be 250 feet long and 50 feet wide.

The big brick addition to the Bertram shops at Dundas, is being rapidly pushed to completion. The big shop runs between the new molding shop and the main building. The firm has an ever-increasing demand for working space,

A disastrous fire occurred in Preston on Dec. 4, by which the car barns and rolling stock of the Galt, Preston & Hespeler and Preston and Berlin Electric Railways were totally destroyed, loss being estimated at about $75,000.

Barnhill & McLennan, of Amherst, N.S., have purchased a large lumber property at Etiomani, Sask., on which they intend building a 100 horse-power rotary sawmill. The machinery for the mill has been ordered from the Robb Engineering Co.

A company is to be established at Halifax, N.S., for the manufacture of railway box cars, flat cars, coal hoppers, and baggage cars. The plant will have a capacity of 1,500 cars a year, employing 250 men, with an annual wage outlay of $150,000.

Asbestos in payable quantity and quality has been discovered in the Transvaal. An expert who has examined the deposit states that it is of abnormal width and equal to the finest in Canada or Italy. An offer of £40 per ton has been received from Germany for the best quality.

Edmonton passed four money by-laws this week, totalling $275,000. Of this $121,000 was for paving, $119,000 for rails for the street railway, $45,000 for an incinerator, and $30,000 for the purchase of a third park site, two having previously been purchased. All the by-laws were passed by large majorities.

The Commercial Cement Company has been incorporated in Winnipeg with a capital of $150,000. The mills will be located on Boyne River where a good supply of suitable rock has been secured. Machinery has been ordered which will equip a mill with a capacity of 1,000 barrels per day.

One enterprising lumber firm in British Columbia, are building a small town on their limit, having erected houses for the married men, and plans are being prepared for the erection of a large hotel for the accommodation of the unmarried men, with a $2,000 bowling alley in the building.

A proposition to establish a large car building plant in St. John, N.B., is spoken of, both United States and Canadian capital being interested. If the proposition succeeds motor cars will be built. The promotors are figuring on developing power from Riverson Falls of St. John River.

A valuable discovery of iron ore was recently made in the Township of Snowdon, in the Haliburton District, about three-quarters of a mile from the line of the Irondale and Bancroft Railway. The deposit is 150 feet wide, and the ore a high grade magnetite. It is the largest body of ore yet discovered in the district.

An item in the last issue of Canadian Machinery made mention of a bearing company proposing to manufacture Wright's Roller Bearings in St. Catharines. This information was incorrect, as the only company having the right to manufacture Wright's Paper Rolling Bearings in Canada, is the Canadian Bearings Limited, of Hamilton.

The Dominion Carbonic Company has been incorporated with a share capital of $40,000, with head office Toronto, for the purpose of manufacturing gas, and dealing in all gas products, chemicals, and chemical products. Provisional Directors of the company will be R. J. Quale, and H. Woodbury, of Buffalo, N. Y.; Allen and J. J. Maclennan, of Toronto.

The Canada Foundry Company, of Toronto, have completed the erection of the structural steel for the west side of the Canada General Electric Company's new transformer building. Work will now begin on the east side wall, and in three week's time it is expected, the job of placing the roof on the building will be commenced. Operations will be continued all winter.

A company has been formed for the purpose of building and equipping cars for railways, also to manufacture all railway equipment and appliances. The corporate name of the company will be the National Car Company, with a share capital of $300,000, and head office at Toronto. The Provisional Directors of the company will be A. Stewart, T. H. Kilgore and L. Williams, of Toronto.

A steel industry capitalized at five millions, is the latest proposition to come before the Goderich Council, they state that the plant would employ about 1,500 hands, and occupy 100 acres. They ask certain bonuses, and the council have decided to take the matter up with the Canadian Pacific, with whom the steel interests have already communicated, and see what inducements can be offered.

New Sales Office.

To place them in a position to be able to better serve their customers in the Eastern States the Warner & Swasey Co., of Cleveland, Ohio, have opened a New York office in the Singer Building, 149 Broadway. Mr. H. L. Kinsley, formerly eastern representative, will be in charge, and make this his headquarters.

CONDENSED ADS.

WESTERN REPRESENTATIVE WANTED.

AN agent in the west to handle Beardshaws' "Conqueror" high speed steel and drills, which are meeting with a favorable reception throughout Canada. Alex. Gibb, 13 St. John St., Montreal.

FOR SALE

$600.00 WILL buy Patterns for the following size gasoline engines: 3 and 6 horse power stationary; 5 horse power double opposed air cooled; 16 horse power double opposed cylinder; 12 horse power double upright, stationary; 10 horse power double upright auto or marine; 40 horse power, 4 cylinder marine. All in good order. Have built several hundred high grade engines from these patterns. D. McKenzie & Co., London, Ont. [1]

SMOKE consumers are not necessary with producer gas power, because the smoke is turned into gas and used for power; no matter what fuel you use there is absolutely no smoke; write for details or call. W. Gillespie, 98 Front Street, Toronto.

CORBET Foundry and Machine Company, Owen Sound, Ont., make a specialty of marine and stationary engines and boiler repairs; also all kinds of sheet steel work, such as stacks, flumes, hoppers, etc.; write for prices.

TURBINE Water Wheels—The following is another proof that the Canadian turbine is the most economical wheel made: "Almonte, Ontario, with a pair of 42" Canadian turbines, is practically the only town in the Ottawa valley having an extensive electric plant that was able to run to its full capacity throughout this dry summer, with water to spare." Charles Barber & Sons, Meaford, Ontario.

ASSIGNEE'S sale of steam planing mill and sash and door factory in the City of Woodstock, Ontario; first-class and old-established stand; only one other in city; will be sold by auction, Thursday, December 27th, at 2 p.m. H. B. Sproat, assignee, Woodstock, Ont.

"LITTLE GIANT" turbine water wheels, machine-cut wood and iron tooth gearing; power transmission machinery orders executed with despatch; get catalogue and prices. J. C. Wilson & Co., Glenora, Ont.

SITUATIONS VACANT

WANTED—Moulders and patternmakers—Accustomed to sawmill work. Apply, at once, to the Madison Williams Manufacturing Co., Lindsay, Ont.

FOREMAN Moulder and coremaker; thoroughly experienced in engine and machinery work; steady employment and good wages. Apply Clinton Thresher Co., Clinton, Ont.

WANTED—Mechanical draftsman (assistant). The Smart-Turner Machine Co., Limited, Hamilton, Ont.

Power Commission Letter.

Replying to the criticisms of the Hydro-Electro Power Commission's report in a letter in which they placed that the cost of power at $15 to $17.75 per h.p. at the city limits of Toronto, a letter has been written to the Board of Control of the city. They state that their investigations show that 25-cycle alternating current power at 550 or 220 volts could be furnished to the customers in the city of Toronto based on the maximum price furnished by the commission at from one cent per k.w. hour for the larger customers with overhead distribution, to 2 1-2 cents per k.w. hour for the smaller customers, receiving their power from the underground distribution.

The prices at present charged by the Toronto Electric Company vary from 2 2-3 cents per k.w. hour to 8 cents for smaller ones. It should, however, be stated that the present consumers of electric power would be under the necessity of exchanging their present direct current motors for 25-cycle alternating current ones, but it is evident that the estimated reduction in rates would afford them ample inducement to make the change.

It may also be said that the capital expenditure for an exclusive 25-cycle distribution would be very much less than that given in the first report of the Hydro-Electro Power Commission, probably not one-half.

As for arc lighting, the most modern type of enclosed arc lamps of the greatest power obtainable could be supplied at a cost of $47.25 per lamp per annum on the basis of a 1,400 light installation. In this connection I may say that recent improvements in street arc lighting would make it possible to reduce the cost to about $40 per lamp.

S.O.S. Annual Dinner.

The Engineering Society of the Faculty of Applied Science held their eighteenth annual dinner at the Rossin House on Dec. 7. The affair was a decided success, both financially and sociably. Among the guests from the engineering profession were:—C. H. Rust, city engineer, Toronto; M. J. Haney, contracting firm of Haney & Miller; E. Burk, Ontario Association Architects; A. N. Conner, Connor, Clark and Mons; F. S. Scott, consulting structural engineer, Toronto; and S. Gagne, secretary-treasurer, Toronto Branch of C.S.C.E.

S.P.S. Electrical Club.

For some time there has been a feeling among the senior mechanical and electrical students of the Faculty of Applied Science, University of Toronto, that the formation of a club for the discussing of subjects and the reading of papers of direct interest to them would be advantageous. This has culminated in the holding of a general meeting at which the S.P.S. Electrical Club was organized with the following officers: Hon. President, Dr. Galbraith; President, Mills Maclaughlan; Vice-President, F. R. Ewart; Secretary-Treasurer, J. C. Armer; Fourth Year Representative, N. P. F. Death; Third Year Representative, G. P. Coulter and C. N. Hutton; Critics, Prof. Rosebrugh, Prof. Angus, H. N. Price, B.A. Sc.; W. W. Gray, B.A., Sc.; H. G. Smith, B.A., Sc., and S. Dushman, B.A. The enthusiasm displayed at the organization meeting argues well for the success of the club.

Street Railway Convention.

At the King Edward Hotel, Toronto, on Dec. 6th and 7th, the semi-annual convention of the Canadian Street Railway Association was held. Nearly all the large companies in Canada were represented. A number of very instructive and interesting papers were contributed as follows: "Some of the Shops," by W. R. McRae, master mechanic of the Toronto Railway Company; "Track Construction, Maintenance and Repair," by A. M. Grantham, C.E., Toronto Railway Company; "Discipline," by J. E. Hutcheson, Ottawa Electrical Railway Co.; "Standardization of Equipment" by C. B. King, manager London Street Railway; "Freight and Mail," by E. F. Seixas; "Columbus Convention," by A. H. Royce, secretary of the association; "History of Electric Traction in the Province of Ontario," by Robert Clarke, Toronto Railway Company; "The Power House," by J. C. Rothery, of the East Liverpool, Ohio, Traction and Light Company.

New Car Company.

A million dollar car manufacturing plant has been proposed for Fort William, Ont., which is expected to give employment to between 400 and 1,000 men the year round. H. G. Brown, of Montreal, is interested in this and it is fully expected that construction will be begun in the spring.

Large Salary Increase.

The Yale & Towne Mfg. Co. have recently announced at a meeting of the president with the superintendent and foreman of the Stamfort plant an increase of wages and piece rates, which makes a total increase of $120,000 in one year. Although the average rate of wages and average rate of piece earnings in the Yale & Towne's works have been at no time greater the company recognized that under present industrial conditions a review of these rates is expedient. In the distribution of these voluntary additions to the earnings of the employes the company are giving special consideration to the length of time and quality of service and to individual efficiency of piece rates, as well as of day rates, which will be reviewed and where necessary will be readjusted.

Vice-President Satisfied.

Frank W. Morse, vice-president of the Grand Trunk Pacific announced at Winnipeg on Dec. 17th that they were well satisfied with the work of construction done during the past summer. Eighty per cent. of the construction proposed during the season was carried out. Next year is calculated to see large accomplishments in the way of construction and still more important work in the engineering department for the year 1907. Every precaution is being taken to provide against a scarcity of labor during the coming year, the company having representatives in all the important centres of population and using every means to provide the necessary number of men.

Clay Interests Convention.

The Clay Products Manufacturers' Association of Ontario, met in convention in the Rossin House in Toronto on Wednesday, Thursday, and Friday, December 12th, 13th and 14th. One of the most largely attended and most enthusiastic convention in the history of the association was held. The papers read were of a high order, and all calculated to educate the clay workers, and elevate their standing and grade of workmanship. The program of the convention included at the commencement a welcome to Toronto, by Mayor Coatsworth, followed by a lecture by Professor Coleman of the School of Practical Science of Toronto. Another important address given in the first afternoon of the convention was a paper by J. S. McCamell, manager Milton Pressed Brick Co., Milton, Ont., on "Mining and Preparation of Material." On the morning of the second day of the convention the delegates took a trip by special train to the plant of the Don Valley Brick Co., Todmorden, Ont. The remaining program included the following: Lecture on "Technical Education in its Relation to the Clay Industries," Prof. Edw. Orton, jr., Ohio State University, Columbus, Ohio; "Down Draft Kilns," Wm. McCrody, Lyons, Ont. At 8.15 p.m. a complimentary banquet was given to the members of C.C.P.M. by Toronto Clay Product Manufacturers. On Friday forenoon the following papers were given: "Uses of Exhaust Steam on a Brick Plant," A. M. Wickens, chief engineer Canadian Casualty & Boiler Insurance Co., Toronto; "Comparative Economy of Construction and Operation of Down Draft and Continuous Kilns," J. B. Miller, superintendent Don Valley Brick Co., Toronto; "Brick Spiel," H. de Joannis, editor "Brick," Chicago, Ill.; Lecture by Prof. Baker, Ontario School of Mining, Kingston, Ont; "Waste Heat Drying," Wm. Bailie, former superintendent La Prairie Brick Co., La Prairie, Que., followed by question drawer. A committee comprising of S. J. Fox, M.P.P., Wm. McCredie, J. B. Miller, J. S. McCarnel, C. H. Betchel A. W. Wright, J. B. Lochrie Wm. Handcock, J. Russell, and H. de Joannis

was appointed to confer with Principal Galbraith of the School of Practical Science, in connection with the establishment of a course of Ceramics, at Toronto University. The following officers were elected:—President, J. B. Miller, Toronto; 1st Vice-President, J. S. McCannell, Milton; 2nd Vice-President, Charles Curtis, Peterborough; 3rd Vice-President, J. Cornhill, Chatham; Secretary-Treasuer, C. H. Bechtel, Waterloo; Executive, S. J. Fox, M.P.P., T. M. Mulligan, Harbard; Joseph Russell, Toronto; W. McCredie, Lindsay; David Martin, Thamesville. The association decided to hold its convention in Ottawa next year.

National Founders' Convention.

A record attendance contributed to the success of the convention held in New York on Nov. 14th and 15th by the National Founders' Association. The past season of the association had been marked by a determined struggle for the open shop. Some points brought out at this convention were that the assumption that the molder must be the product of a four years' apprenticeship was exploded also that unskilled labor with the aid of molding machine could make foundry independent of union domination. Moreover it was found that the restriction of the machines used and the number of apprentices insisted upon by union interests must be swept away if the rapidly increasing need of foundry products was to be met. In an educational way the association has accomplished much good in the past year. Lessons taught by strikes during the past year were emphasized as follows:—

The absolute injustice of the minimum wage principle as applied to skilled labor.

The mistake of employes in opposing the introduction of labor saving machinery.

The rank injustice to the rising generation in limiting its opportunity of learning a trade.

No organization can long continue that stands unequivocally for reducing all mechanics to the same level; compelling the competent to divide earnings with the incompetent. This principle gradually but surely lowers the standard of the craft.

Neither can an organization long endure that persists in denying young men the opportunity this country affords them to develop along the line for which they are best fitted and receive their reward in proportion to the ability they possess and apply.

Also prominent among these lessons taught is the duty we, as manufacturers owe our loyal foreman. When such foremen have had this work in hand, the greatest progress has been made, and the foreman who cannot honestly perform the work assigned to him when defending his employers on such an issue as that presented this season is blind not only to his own interest, but to mankind in general.

It is manifestly our duty as proprietors and employers of labor, to look after both the welfare and attitude of our foremen, to understand them, to maintain their confidence, respect and strict loyalty. If such relations cannot be maintained then a change in foremen is imperative.

The greatest lesson taught is to our journeymen, who, if they expect to maintain an organization that will command the respect and good will of their employers must cause their unions to be dominated by the conservative, fair-minded element.

It has been demonstrated beyond question that foundries can be operated, castings produced and success obtained in the foundry business in spite of the effort of arrogant union officials to contrary.

When the workingmen of this continent learn the lesson of obedience to the law and constitution of the country in which they live, and to confine the functions of their organization within the limits of such laws and constitution 90 per cent. of the conflicts between capital and labor will disappear.

The greatest lesson to all, is that strikes such as we have faced this season are but a culmination of unwise, unreasonable and incompetent leadership of the masses of workmen, that they are merely a temporary conflict provided we will accept the means within our reach of dealing direct with and educating our own workmen instead of passing such dealings through the medium of the irresponsible agitator, who in ninety-nine cases out of one hundred distorts any statement made to him to suit his own opinions when presenting it to the members of his union.

The officers elected were:—President, O. P. Briggs Minneapolis; Vice-President Henry A. Carpenter, Providence; Secretary, F. W. Hutchings, Detroit; Treasurer, Western Trust & Savings Bank, Chicago; Honorary Member, W. H. Pfahler, Philadelphia. Besides these was a long list of district officers, those of the seventh division representing Canada being:—H. Cockshutt, Cock-Edgar McDougall, John McDougall, Caledonia Iron Works Co., Ltd. Montreal, Que.; R. J. Whyte, Frost & Wood Co., Ltd., Smith's Falls, Ont.; Frederic Nicholls Canada Foundry Co., Ltd., Toronto, and John M. Taylor, Taylor-Forbes Co., Ltd., Guelph, Ont.; C. Bermingham, Canada Locomotive Works, Kingston, was appointed a member of the Press Committee and Geo. W. Watts, Canada Foundry Co., Toronto, a member of Finance and Auditing. Among those from this side of the border at the convention were L. L. Anthes, Toronto Foundry Co., Toronto and John M. Taylor, Taylor-Forbes Co., Guelph.

Canada Metal Company Expands.

W. G. Harris of the Canada Metal Company, Toronto, has purchased the Toronto Ball Grounds occupying 3½ acres adjacent to the Grand Trunk and Canadian Pacific Railway in Parkdale and will next fall commence the erection of two buildings 40 feet wide by 500 feet in length, the railroad site being run between the two buildings which will be of concrete fire proof construction, one two storeys in height and the other one storey.

The Canada Metal Company have outgrown their present premises on William Street, the rapid development of their business having made necessary the present changes. They have recently constructed several furnaces for smelting copper, lead and zinc ores and intend to develop this branch of their trade so that it can be gone into on a larger scale when the new buildings are erected. The large floor space which will be available in the new premises will allow the company to still further develop their lead and tin rolling, galvanizing and tinning industry as well as taking up the smelting of ores.

The growth of the Canada Metal Company's business under Mr. Harris' management has been almost extraordinary, and they are to be congratulated upon securing such a splendid site for the enlargement of their business. The site is immediately adjoining the present plant of the Toronto Foundry Company, and of the land purchased a block of about 183 x 500 feet will be held for future developments.

Gasoline Company Insolvent.

The winding-up order was granted recently in respect to the McLachlan Engine Co., which was incorporated in the Ontario Company's Act in June, 1899. The McLachlan Company have been manufacturing at Swansea during the past year, but have been particularly unfortunate with their output.

Peterboro Works Closed.

Considerable surprise was evinced in manufacturing circles, when, on the motion of the Ontario Bank, Chief Justice Meredith granted a winding-up order of the Wm. Hamilton Manufacturing Co., of Peterboro. On Dec. 6th the company decided to admit its insolvency. The employes numbered 225 men, and the closing of this large works will mean a heavy set-back to the manufacturing interests in Peterboro. The company was organized in 1883, and have been carrying on an extensive manufacturing business, sawmills, mining machinery and water mills.

Big Cement Plant.

Southern Manitoba is looking forward to the establishment of an enormous cement industry which will envolve the investment of several hundred thousand dollars. The rights to a valuable depost in Southern Manitoba have been secured by a number of capitalists and the costly machinery for the production of a high-grade cement will be installed.

ISLAND CITY

YOUR MACHINE PAINT

is possibly not up to the standard. Perhaps it does not give you the satisfaction you would like.

WE manufacture a splendid line of paints for the special use of machinery manufacturers who require a good, easily applied, hard wearing, and beautifying paint.

IT is made in paste form and can be used as a filler, applying with a knife. For brushing purposes it may be thinned with turpentine.

OUR PAINT has great covering capacity, spreads freely and leaves a good surface.

CLASS "N" ADJUSTABLE COLLAPSING TAPS

You can save Taps, Threads, Time and Money by using our Class "N" Adjustable Collapsing Taps. When the required depth of hole is tapped, the chasers automatically recede and the tap can instantly be withdrawn.

This saves the time of backing out, prevents injury to the threads and to the cutting edges of the tap, which gives longer and better service.

This tool is made for use on brass finishing lathes, screw machines and on any turret head

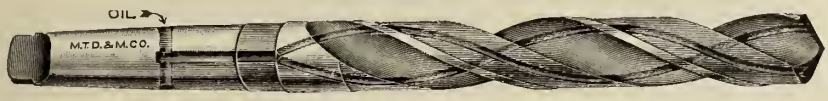
Twist Drills

Standard Drills are used by the largest manufacturers, with the best of success. We claim Highest Quality and our goods will verify our claim. If you have never used them send us a trial order. We are prepared to meet any condition of service.

DRILLS WITH LUBRICATING HOLES.



If you want to make a hole at a maximum of speed, and at the same time with the greatest accuracy, use one of our drills with holes from shank to point for conveying oil or other lubricant to the point of the drill. The general advantages of this form of lubricated drill over the ordinary twist drill are the greatly increased speed possible in drilling, the assistance given by the lubricant in the discharge of the chips, its durability and high cutting efficiency. The sizes commonly used are from ⅜ inch to 2½ inches diameter. Our drills have the lubricating hole through the solid metal, this latest improvement in lubricating drills being made solely by us under patents which we own. The special advantage of this drill over the other makes of drills with lubricating holes is that it is composed of one solid piece of steel; there is no part to work loose or wear out, the whole of the drill having the same life. In manufacturing large quantities of a single articles having a drilled hole, one of our drills is invaluable. This is because of its long life, the speed at which it can be run without getting too hot for use, and the time saved by not having to withdraw the drill from the hole to cool it or to remove the chips.

ARE YOU SATISFIED WITH YOUR OUTPUT?

The chances are you are not, but have been looking for something that would enable you to increase it and at the same time reduce the cost of production.

THE UNITED STATES TURNING TOOLS

have been designed to reduce your tool steel bills, eliminate the expensive forging and grinding of forged tools. and by their solid construction take extremely heavy cuts, thus increasing the day's work.

The cutters are rigidly supported on the sides and bottom, this prevents chattering under a heavy cut.

The clamp screw cannot burr on the end, the large diameter gives greater clamping power.

Send for one to-day, it is fully guaranteed.

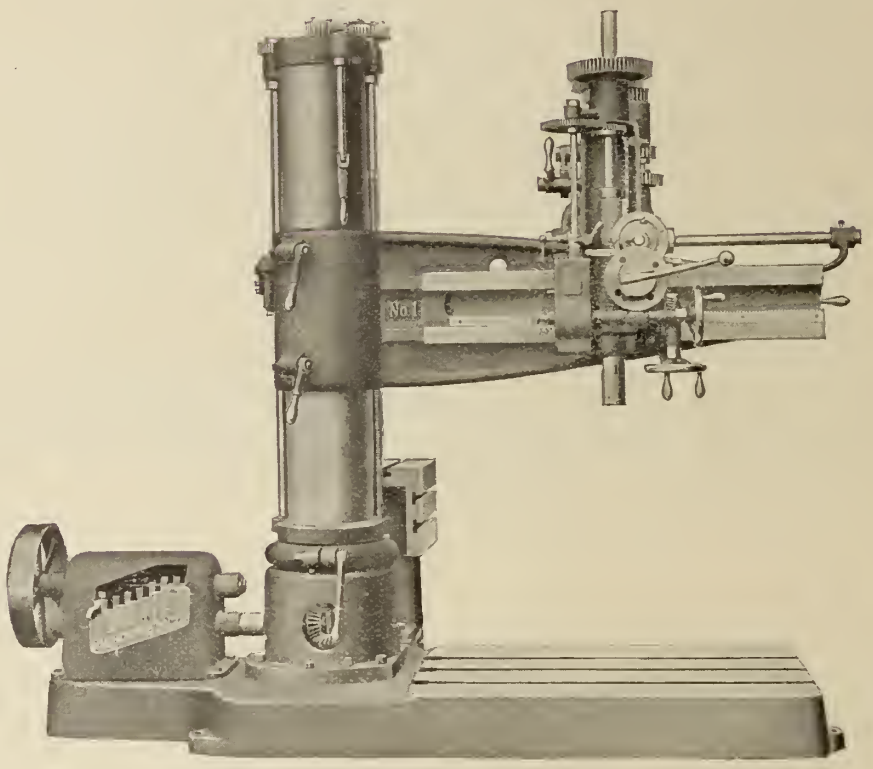
H. W. PETRIE, Toronto

Our Latest and Best



Five years ago we brought out a line of IMPROVED RADIALS which to-day are known the world over. With this machine we introduced the SPEED BOX to the machine tool world and blazed a trail which has been followed by many copyists.

To this machine we have added—

A TRIPLE DRIVING GEAR HEAD, operated by ONE LEVER and placed between the tapping attachment and the spindle.

A SPEED BOX WITH EIGHT SPEEDS operated by ONE LEVER, which, in conjunction with the back gears, gives TWENTY-FOUR SPINDLE SPEEDS.

FULLY 50% MORE DRIVING POWER, which means the STRONGEST RADIAL BUILT.

We have retained the following well-known valuable features—

The dial depth gauge. The automatic trip. The range of eight feeds. The pipe section arm. The double round column.

WE HAVE ELIMINATED all friction driving clutches in the speed changing mechanism.

After a long series of tests of every description we now offer this machine in three sizes—4, 5 and 6' arms.

We are confident that point for point an unbiased comparison will convince you that we excel in the following essential features : POWER, DURABILITY, SIMPLICITY and EASE of MANIPULATION.

Our 1906 Radial Drill catalog tells the rest.

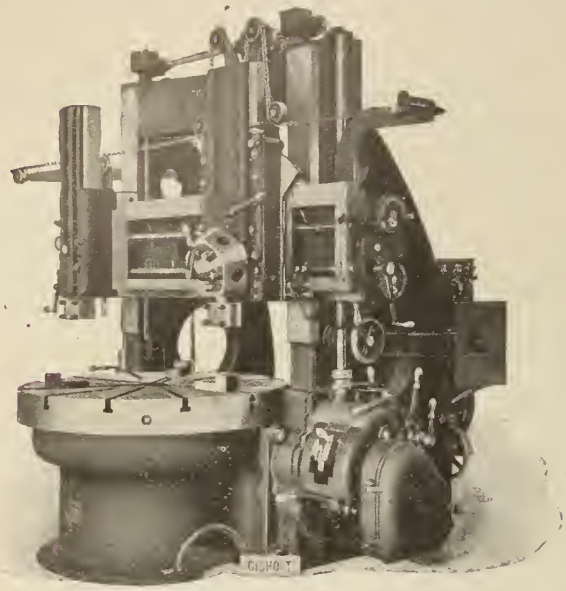
GISHOLT



52-inch Gisholt Mill with Turret Head

Gisholt Combination Bar and Chucking Machines

Gisholt Lathes are equally adaptable to bar or chucked work. Bar work up to 6 inches—chucked work to the swing of any of the six sizes ranging from 13 inches to 41½ inches. A machine of this kind may be kept going part of the time on chucked, part on bar work. Many railroad shops are now using Gisholt Lathes in this way.

Gisholt Boring Mills

Have established a new standard for machines of this style. The friction headstock operated from either side of the machine, giving perfect control; the automatic stop for all feeds, the quick traverse of saddles and slides by power, the appliances to minimize calipering, a strong construction, all tend to place Gisholt Mills in the front rank of time and labor saving tools.

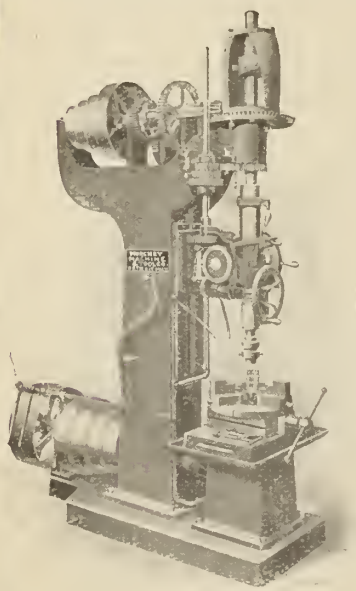
The Tapping Machine You Want



New Murchey Tapping Machine.

Because it is a Money-saver as well as a Rapid Worker.

Power, Simplicity and **Strength** are the keynotes of this machine.

One man can operate several of these machines as easily as he can operate one.

We mail interesting facts to interested parties.

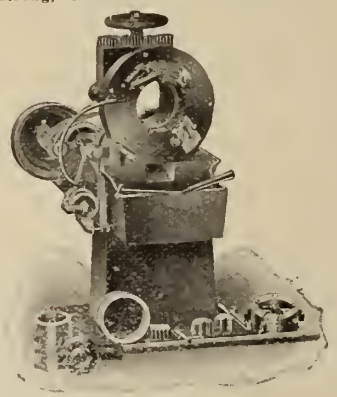
CAN YOU AFFORD TO BE WITHOUT THIS MACHINE?

MURCHEY MACHINE & TOOL CO.

DETROIT, MICH., U.S.A.

ECONOMY—ECONOMY

That is this Merrell's strong point. No other Pipe Threading and Cutting Machine combines **so many** labor saving and money saving and time saving features as does this compact, strong, serviceable combined Hand and Power Merrell.



Anyone can operate it with perfect satisfaction and safety.

It can be carried anywhere and used anywhere. Cuts and threads any kind of pipe up to 12 inches satisfactorily under all conditions.

Don't you think you'd better get in touch with us at once?

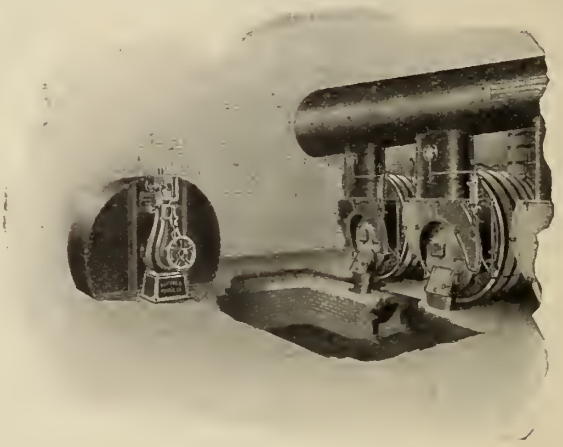
Mechanical Draft

An application of fans for securing the highest efficiency of fuel and the greatest steaming capacity of boilers—Fiske.

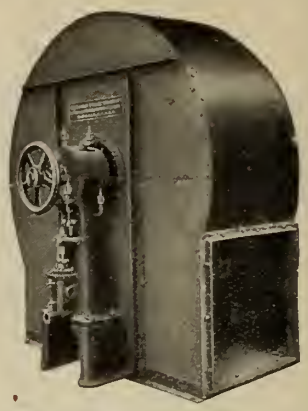
THERE is nothing new or irrational about Mechanical Draft—It dates back from the first use of bellows, and is best appreciated in the latest and largest power plants.

Buffalo Electric "B" Volume Exhauster

MECHANICAL DRAFT means a positive control over your boilers. No dependence on weather conditions. No fixed limit to boiler capacity. Quick response to demands for steam.



A typical Buffalo Induced Draft Plant.



Left Hand Bottom Horizontal Discharge Fan with Cylinder below shaft engine.

MECHANICAL DRAFT means no tall, expensive chimneys. Perfect combustion of low-grade fuels. Realizes, in connection with fuel economizers, the highest possible boiler efficiency.

MECHANICAL DRAFT has long ceased to be an experiment, but is well defined and accepted engineering practice. The best results are only possible when installations are designed and executed by specialists in this service. Bring your draft problems to us.

A New Industry in the West

BY GEORGE B. PERRY

WHAT may be classed as a new industry in the West, and one which has been gradually finding field for development as the towns of Western Canada have grown in the past four years, is the manufacture of water pipe from the famous Douglas fir of British Columbia. This material lends itself peculiarly to the construction of stave pipe, because of its wonderful quality, being so clear and straight grained and free from all defects. It is possible to secure a class of timber in B.C. which is absolutely free from knots, pitch pockets, shakes, or other defects common in almost every other class of timber. This perfect timber is used in making machine-banded wood stave and water pipe.

The product, which is being turned out by the factory of the Pacific Coast Pipe Company and the Canada Pipe Company in Vancouver, is finding favor in the entire West, and has even been making its way in Eastern Canada. As a material at once cheap and reliable and satisfactory for water-works construction in towns and cities, the wood stave pipe is recommending itself to those numerous towns in the new West which find themselves with perhaps very moderate means, compelled to instal an entire new system of water supply. The conditions in the West are such that very young communities have to undertake public works of this kind which much older towns in the East have not yet thought of.

Naturally, when such heavy responsibilities are to be undertaken, with their burden of taxation, economy as well as efficiency is a factor of very great importance. In this way, many towns in the new provinces of Western Canada are being enabled, through using wood stave pipe, to instal very complete and high-class water-works systems at very low cost. The number of such towns where modern improvements are demanded increases year by year with the wonderful growth that characterizes the West.

Fig. 1.—Making Wood Stave Pipe in plant of Pacific Coast Pipe Co., Vancouver, B.C.

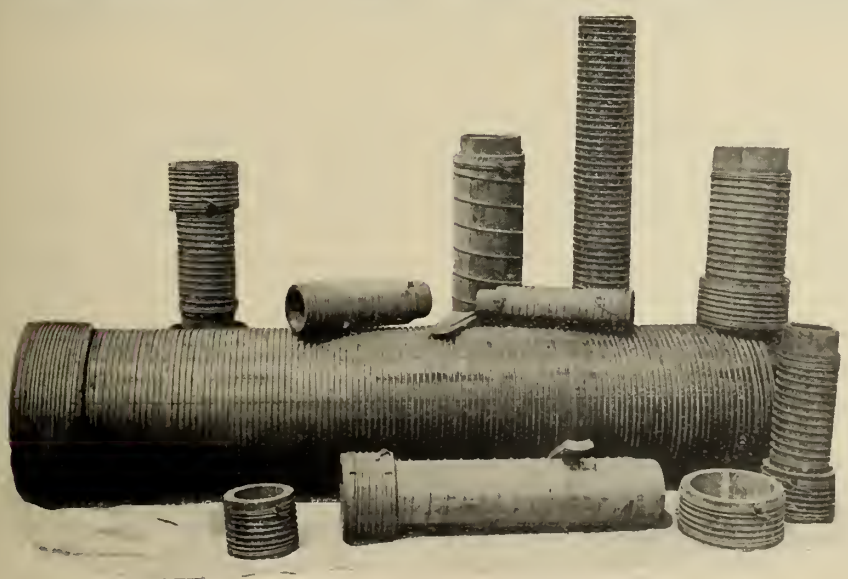

Fig. 2.—Wood Pipe Designed for Different Pressures.

Machine-banded wood stave pipe has been constructed in the United States for many years. The first factory was in Eastern New York State, and many towns have systems installed with this product many years ago. In the West, the wood stave pipe of machine-banded construction has for many years been made in the State of Washington, where the class of timber is practically the same as that in B.C. It is this splendid material, which makes it possible to turn out such a high-class pipe at a price so much lower than any other pipe made. It is in fact a specialty, and no other timbered region in Canada can ever turn out the class of product which is being made in Vancouver from the Douglas fir.

The machine-banded pipe is made in all sizes from 2 to 24 inches, internal diameter, and is also constructed for all pressures, from mere conduit pipe, suitable for irrigation, up to several hundred feet head. In making the pipe of these different pressures, there is no difference in the quality of the material, the banding being the only change, the construction being exactly similar. In all cases the pipe is positively guaranteed to stand the pressure for which it is supplied.

Many eminent engineers, including some of the most prominent consulting engineers in water-works construction in Eastern Canada, have expressed themselves as heartily in favor of the wood stave pipe. Its use is so extensive now that there is no question of experiment in it, and the fact that it

has been used so many years with extreme satisfaction is proof that the claims of the manufacturer are well substantiated.

The Pacific Coast Pipe Company, Limited, have well equipped and very conveniently arranged factories in Vancouver, their headquarters, and many Canadian engineers, and members of the Canadian Manufacturers' Association inspected the works the past summer, on the occasion of the visits of the engineers and the manufacturers to the Coast. The process of manufacture is simple, yet part of it is a specialty, and skilled men are employed, while not a section of pipe is turned out which has not had the most watchful supervision in the various steps of manufacture. This care and excellent workmanship is the pride of the manufacturers and they unhesitatingly refer all inquirers to the many cities and towns which have used their product in the three seasons it has been made, since the factory was established.

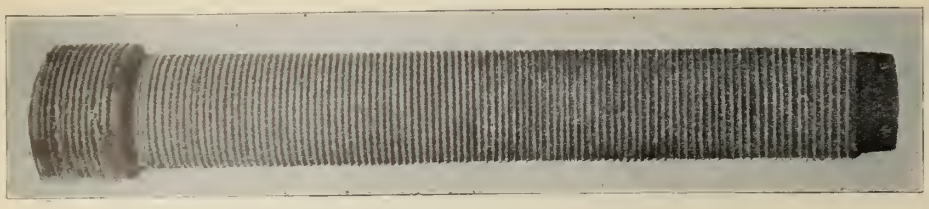

Fig. 3.—High Pressure Wood Stave Pipe with Flange Coupling.

The Business Situation

BY B. E. WALKER, President Canadian Bank Commerce

WHILE we are enjoying an extraordinary prosperity, there are signs of a strain which must bring trouble if disregarded. We are a borrowing country, and we cannot be reminded of this too often. As we fix capital in new structures, public or private, railways, buildings, etc., some one must find the capital in excess of what we can ourselves provide out of the saleable products of our labor. The number of countries willing to buy our securities has been steadily increasing, but we must not be blind, as we sometimes seem to be, to the fact that our power to build depends largely on whether these countries have surplus capital to invest. By means of the cable the trading nations of the world have been brought very near together, and while nations of the world have been averted, and the adjustment of capital to the world's needs has been greatly improved, still for the same reason world-wide trouble in the money markets sometimes arises with a suddenness which is alarming to those at least who are not watching for the signs. We are passing through such a period just now, happily without a general breakdown, but unless we mend our ways we are not likely to escape a similar or still worse condition next autumn which may wreck our fair prosperity. Europe is bearing the enormous cost of two great wars, both in the loss of capital actually destroyed and also in the loss to individuals from the decline in the values of the national securities of the countries interested in the wars. And since these wars, losses on an unexampled scale have occurred by earthquakes and fire. The volume of trade and the unusual amount of building in many countries have at the same time vastly increased the amount of capital required. This has been accompanied by a steady rise in prices throughout the world, and by a most pronounced and widespread advance in the scale of personal expenditure. It is true that it has also been accompanied by the greatest production of gold and of other commodities, but the effect of the various influences has naturally been to put upon the money markets a strain which has only just failed to cause a general breakdown of credit. To make the outlook still more serious, the United States, and other less important countries, including Canada, contemplate expenditures on a very large scale for railway and other building. This, then, is a time for every prudent man to survey carefully his financial position. If he has debts he should consider how he will pay them if he should have to face world-wide stringency in money. Has he assets which the world needs for daily use, or assets which will sell only when the sun is shining? If he is happily in easy conditions as to debt, he will, if he is wise, consider every circumstance arising in his business which tends towards debt instead of towards liquidation. As for those who are plunging in real estate at inflated prices and in mining stocks, nothing, we presume, but the inevitable collapse which follows these seasons of mania will do any good.

Fig. 4.—Low Pressure Wood Stave Pipe, Self Coupling.

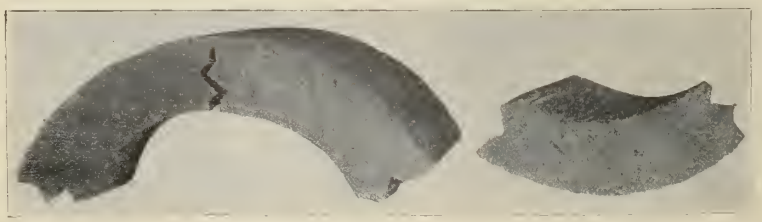

Fig. 5.—Wood Stave, Showing Joint.

BIG FIRMS AMALGAMATE.

Particulars of the amalgamation of the Canada Screw Company, established 1866, and the Ontario Tack Company, established in 1887, two of Hamilton's largest industries, have been announced. Nearly $2,000,000 is involved in the deal. The plants of both concerns are to be considerably enlarged and new lines added to their products. Application has been made for a new charter in which the capital stock will be greatly increased in order to allow for the extension of the works.

The new company will be known as the Canada Screw Co., and the officers will be: Cyrus A. Birge, president; Chas. Alexander, vice-president; F. H. Whitton, general manager; W. F. Coote, secretary-treasurer; James O. Callaghan, director of works. The other directors will be Hon. Senator Gibson and Charles S. Wilcox.

Industrial Waters: An Important Feature in Manufacturing

By J. A. De Cew, B.A. Sc, Chemical Engineer

WHEN a marked industrial growth is taking place in a new country and many factors are exerting their influence either for or against the development of different localities or districts, it is very interesting to note the rivalry that often exists between various towns and cities, any of which may be selected as the site for a coming industry.

When a manufacturer happens to be looking for a location for his plant, he naturally desires to select a locality which will offer him the cheapest production, and he is more often influenced by such a consideration than by any artificial stimulus that may be offered.

Therefore, after such questions as raw materials, market and transportation have been considered, the effect of local conditions on the cost of manufacture is of vital consequence.

As compared with the other natural advantages of a manufacturing region, the availability of a pure and cheap water supply is of the greatest economic importance. The amount of water that is used in some industries is hard to conceive when thinking of it in gallons and it is only when water has to be purchased that this factor is thought of at all, as there are many industries that would hardly exist at all if they were obliged to consider the water they use as an item of expense. However, it is these very manufacturers that are most seriously concerned with the quality of the water that they use, for a very small content of an injurious ingredient may seriously affect the quality of the material treated when such large quantities of water are used.

We have many localities in Canada where the water is relatively soft owing to the insolubility of the rocks and soil over which the streams and rivers pass. Yet these same waters often carry in solution ferruginous and organic matters which are equally deleterious to many industries. On the other hand are many streams whose course lies mainly through a limestone region and these always contain what are commonly called hard waters.

In Eastern Canada the quality of our average river water is not considered bad from an industrial standpoint and this is one of the reasons that the manufacturer so often ignores the fact that even moderately bad water may do a lot of injury when used in sufficient quantity.

Boiler Feed Waters.

There is one use for water which nearly all manufacturers have in common and that is in the production of steam. In this operation a more or less impure water is continually coming into the boiler while nothing but pure water is passing out in the form of steam and it is common experience that what we consider to be pretty good water will soon leave behind considerable residue. The question to determine from the standpoint of boiler economy is, how bad will the water have to be before it will pay to treat it for the removal of the scale-forming solids prior to its use in steam production. This of course depends upon the relation between the loss sustained from using the natural water and the cost of purification, and whenever the matter is treated as being worth consideration the probabilities are always in favor of the methods of purifying.

It is not only in the production of steam that water softeners are found necessary, but also in the washing treatments of many materials.

In dying, printing, bleaching, wool-washing, paper-making, soap-making, laundrying and tanning, calcarious waters are found to be very injurious and troublesome. Therefore, these industries are often confronted with various losses and difficulties in addition to the lost efficiency of their boilers, owing to the chemical action of these hard waters upon their manufactured product. When an industry of this kind happens to be established in a locality where soft water is not obtainable, it is generally found profitable to purify a large portion of the water supply.

Soap Works.

In the manufacture of soap a water containing bicarbonates of calcium and magnesium should never be used without purification, otherwise the insoluble soaps that these metals form will become incorporated and injure the quality of the product. On the other hand the water may contain chlorides or soluble sulphates and in this case it is very difficult to effect a complete saponification. A water containing organic or earthy matters in suspension is not fit for soap-makers use until it has undergone a careful filtration.

In fact the importance of using a pure soft water in making soap is evinced by the fact that one of the daily uses and functions of soap is to make water soft, for this has to be accomplished before a lather can be formed.

Laundries.

The production of soft water by means of soap is anything but an economical method however, and when we find that a hard water is used in the laundry we also find that the amount of soap consumed is many times that actually doing useful work on the clothes. Now if an attempt is made to soften the water while in use by adding sodium carbonate, a precipitate of calcium carbonate is deposited on the fabric and this is the cause of many blotches and spots that are difficult to remove.

Owing to this it is absolutely necessary in laundry work that any purification required must be prior to the operation of washing.

Tanneries.

In the process of tanning large quantities of water are used both in the unhairing treatment and in the tan-pit.

In the unhairing process the greasy matter secreted by the small hair glands is saponified by means of quick-lime and if the water used should contain the bi-carbonate of calcium in solution, it is immediately acted on by the free lime and the insoluble carbonate of calcium precipitated. This then becomes deposited in the dermic tissue and interferes with the absorption of the tannin into the cells of the hide thus retarding the tanning process as well as causing brown stains in the leather.

If a hard water should be used in tan pits, the bi-carbonates of lime and magnesia become converted into tannates of lime and magnesia which oxidize rapidly in the air to form secondary products of tan-oxylic and tan-omelanic acids and these produce a brown coloration in the leather. When a water is used in tanning contains salts of iron in solution, these will, in contact with air, become quickly transformed from the ferrous to the ferric state and then combine with the tannin in the leather giving the black coloration of the tannate of iron.

These iron salts, however, can be removed by a special treatment in the same apparatus that removes the lime and magnesium salts. This treatment of ferruginous waters is one that might be of interest to the tanners of Canada for the writer has been informed that they often experience difficulties from the use of waters of this kind.

Paper Mills.

In the manufacture of paper the quality of water used has an important bearing upon the color and sizing properties.

In the case of a ferruginous water a brown tinge is given to the paper by the precipitated oxides. With a hard

water carrying calcium and magnesium salts, a well sized paper is difficult to obtain for a quantity of the resinates of these metals are formed which have no sizing value whatever.

The importance of a good water supply is so vital to this industry that very few paper mills are located where the water is of an unfavorable character. Some mills, however, are unfortunately situated in this regard and to them a proper purification of a portion of the water is preferable to the losses in manufacture that would otherwise result.

Sugar Refineries.

The character of the water used in the production of sugar has a very marked effect upon the processes employed.

For instance, a calcareous water may interfere with the process of diffusion by depositing the insoluble carbonate, while it also damages the residuary produets and diminishes their value as a cattle food.

Moreover, the use of a hard water will cause a deposit on the heating surface of the boiling or evaporating apparatus and as a result the efficiency of these machines is greatly reduced.

This case is then analogous to the others mentioned and the same remedy should be applied.

Methods of Water Purification.

Many chemical and mechanical methods have been suggested and employed for the treatment of unsuitable waters.

For the removal of solids in suspension, gravity or mechanical filtration is generally employed and the present tendency is towards the increased use of those mechanical filters that combine the maximum of filtering area with the minimum of floor space required. These conditions are found ideally represented in the filter press, which, when used for water has a very large capacity.

Waters containing salts in solution can often be partially purified by boiling, but this is much more costly than the precipitation of the salts with chemieal reagents. If, however, chemical materials alone are employed, they must either be used simultaneously with other processes or suffieient time allowed for the subsidence of the flocculent matter precipitated by the treatment.

Either of these methods has its disadvantages and in consequence an apparatus is generally used which will both assist the ehemieal reaction required and also remove the impurities thrown out of solution.

These apparatus which are of various designs are called water softeners, and are the only true solution for the difficulties arising from the use df bad water. Some of them, however, are of much better design than others and give much better results.

In order to assist the reader in choosing a plant of this kind in case it should be required, let us consider some of the essential features of an apparatus of this kind. In the first place, the plant should be so designed that the maximum amount of impurities can be removed with the minimum of effort and expense. The completeness of the purification effected will depend however, upon the accuracy with which the proper amount of softening chemicals is supplied to the water treated, these required proportions being determined by previous analysis. The economy of operation and the capacity of the plant are influenced very largely by the design of the apparatus and the methods employed.

Some softeners are so constructed that a complete chemical re-action and precipitation of the salts cannot be obtained without the use of heat, while other machines are able to obtain the same result in cold water. The latter is, without doubt, a distinct advantage for although it may be said that hot water is required for boiler use yet the fact remains that considerable heat is always lost in radiation before the water can be consumed.

Moreover, an apparatus of this kind should be as nearly as automatic as possible and preferably continuous as well, for it is only in this way that labor and attention can be nearly eliminated.

Some plants of this kind have been known to reduce the hardness of a water from 30 degrees to one half of a degree and at the same time remove all of the suspended impurities in the water.

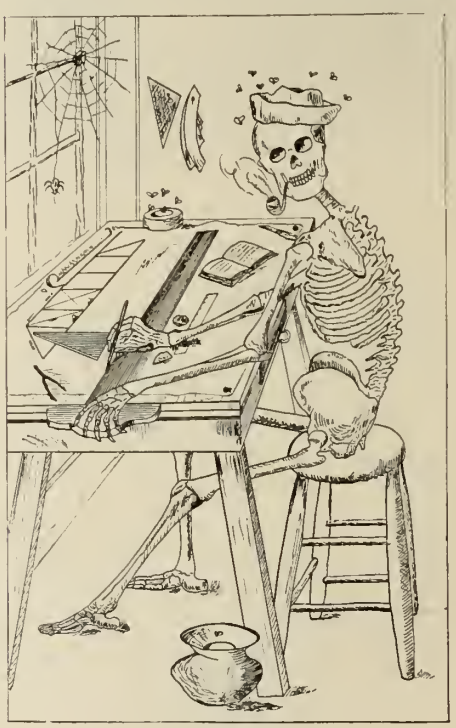
When results like this can be obtained the advantages of and the necessity for, a system of this kind becomes very evident to any manufacturer who is not blessed with an ideal water supply and who gives the question his consideration.

At The Noon Hour

THE WAY OF IT.

"You see, he was whirled around a shaft at the mill and pretty seriously hurt. Now he's suing the boss for $500 damages."

"Well, that's the way of the whirled."



A Long Wait.

A LONG WAIT.

Tired of waiting for back pay which was several weeks overdue, one of the draftsmen in a railway construction office in Canada made the drawing on a large scale as represented herewith, the staff sending it with their compliments to the superintendent of the party. It had the desired effect and before many days everything was adjusted satisfactorily and the men were happy.

KEEP A GOIN'.

If you strike a thorn or rose
Keep a Goin' !
If it hails or if it snows
Keep a Goin' !
Tain't no use to sit and whine
When the fish ain't on your line ;
Bait your hook and keep on tryin'
Keep a Goin' !

If the weather kills your crop
Keep a Goin' !
When you tumble from the top
Keep a Goin' !
S'pose you're out of every dime,
Gettin' broke ain't any crime ;
Tell the world you're feeling prime
Keep a Goin' !

When it looks like all is up
Keep a Goin' !
Drain the sweetness from the cup
Keep a Goin !
See the wild birds on the wing,
Hear the bells that sweetly ring ;
When you feel like sighin'—sing,
Keep a Goin' !

A new collegiate institute will be erected at Brandon, Man., at the cost of $65,000.

Just About Ourselves

Just two years old.

Yes, that is all in years, but youth and age in the newspaper realm are of different import to length of days in human existence.

Twenty-one years must come and go before the human being can claim full maturity. As many days may suffice to bring a newspaper to the state where its definite policy, field and destiny are apparent, but its further growth and development are limited only by the possibilities of its further usefulness and influence.

* * *

When Canadian Machinery started two years ago there was no other mechanical paper in the field, so that it met with a quick and ready response from those interested. From the first issue its success seemed assured, and the publishers are grateful to those who not only recognized that there was a field for such a paper as Canadian Machinery, but who have been loyal from the start and are still numbered as its best friends. Those who have been in closest touch with it have been most ready to express their appreciation of its growth from month to month.

Results speak for themselves and we do not hesitate to let Canadian Machinery as it appears from issue to issue speak for itself. It has now a recognized place in trade journalism that is secure. This has been attained not only by the most diligent effort on the part of the publishers but by suggestions from time to time from friends both far and near. We are always on the lookout for suggestions whereby the paper may be of greater interest and value and appreciate criticisms from any of our readers.

* * *

Its advertising value was strikingly illustrated very recently in an actual test with other industrial and technical newspapers in the Canadian field. A manufacturer of a certain type of apparatus wished to make a special offer of a somewhat unusual kind and to do this he advertised in the same space in the different industrial nespapers in this country. When the results of direct enquiries were counted up it was found that those from Canadian Machinery were more than twice the number received from any other and equalled almost the entire amount of all the rest put together. No more striking proof of its value as an advertising medium could be had than this, as probably at no other time has such an actual test been made whereby a direct judgment on merits could be assured. It is a direct testimony to the value of Canadian Machinery's influence and we are satisfied that the experience of the advertiser in question has been the experience of many others.

* * *

A few of the kind expressions of opinion received at our office during the past few weeks are of interest as illustrating an appreciation entirely unsolicited. "I find it a very valuable paper," E. Auger, Bowmanville, Ont. "I am pleased to tell you that I take great pleasure and interest in reading Canadian Machinery," L. Bailey, Hamilton, Ont. "I have been a constant reader of your paper, Canadian Machinery, for some time and have gained considerable information through the same, especially from the articles on spur and bevel gears," S. W. Jennings, Montreal, Que. "Your paper is all right," the Gardner Governor Co., Quincy, Ill.

Another tribute to Canadian Machinery received recently from the Detroit Foundry Supply Co., Detroit, Mich., explains the feeling of that firm towards us when placing advertising last month: "In connection with this ad., it may be of interest for you to know that this is the first advertisement the Detroit Foundry Supply Co. has resorted to outside of our own paper, the 'Blast,' and is complimentary to Canadian Machinery. However we do not wish you to feel that we are 'handing' you anything, as we can appreciate your progressive and hustling capabilities."

Just one more reference. In a letter from Mr. J. Meredith McKim, manager of the London office of the MacLean Publishing Co., in which he encloses a letter from the London County Council, he states: "The L. C. C. is a very large institution and must employ several thousand hands in its various departments and it is therefore a compliment that the paper should receive an inquiry of this sort. Of course I agree with you it is a well deserved compliment." He stated further having just concluded arrangements with the secretary of the Royal Exchange, Glasgow, Scotland, to supply them with a copy of Canadian Machinery until further notice. This institution is very strict regarding what papers they will accept, so that this is a further tribute.

* * *

As Canadian Machinery stands to-day it comes far short of our aims and ideals. In fact we are planning and preparing to increase its usefulness by the addition of another feature not yet incorporated but which as soon as arrangements can be made will be exploited. We are constantly looking for articles on practical and industrial subjects, systems, cost keeping, methods of reducing labor and any of the many features that are new in our modern industrial progress to improve and further increase the scope of the features already adopted.

THE REAL SOCIETY.

Our chief want in life is, somebody who shall make us do what we can. This is the service of a friend. With him we are easily great. There is a sublime attraction in him to whatever virtue is in us. How he flings wide the doors of existence! What questions we ask of him! What an understanding we have! How few words are needed! It is the only real society. | *Emerson.*

BOOK REVIEWS.

THE SLIDE RULE.—A practical manual by Charles N. Pickworth, Whitworth scholar, author of The Indicator, etc., being the tenth edition of this book. 105 pages, illustrated; price, $1.00. New York: D. Van Nostrand Co., 23 Murray St.

The call for another edition of this the first English work on the modern slide rule, making the tenth to appear, testifies somewhat to the popularity of the author's treatise. Although the working knowledge of the slide rule may be obtained by rote it is indisputable that a comprehensive knowledge of the rudiments of logarithmic computation is necessary to enable the operator to take an intelligent grasp of the subject. A good deal of new matter has been included in this edition, besides a number of new illustrations. New forms of slide rules and a series of special instruments of recent introduction possessing novel features have been included. The practical problems as applied to the slide rule are not only of importance but of extreme interest.

REINFORCED CONCRETE, in three parts. Part (1), Methods of Calculation, by Albert W. Buel, C.E. Part (2), Representative Structures. Part (3). Methods of Construction, by Chas. S. Hill. Second edition revised and enlarged. New York: The Engineering News Publishing Co.

Since the publication of the first edition of this book the edition was practically exhausted before the work of revision was commenced, showing the popularity to which it attained, being an evidence of the need of such a publication as well as an acknowledgment by those interested in concrete work of the manner in which this volume covered the field. The book is not a result of collaboration on the part of the authors, but is really two books in one. Part one, dealing with the methods of calculation, and parts two and three, dealing with the details of and the methods employed in constructing various classes of reinforced concrete structure. In part one the economic uses and property of reinforced concrete are dealt with, followed by chapters on beams and theories of flexure, columns, retaining walls, etc., and tests and designs of arches. Part two takes up and illustrates representative examples of reinforced concrete constructions, dealing with bridges and culverts, tanks and reservoirs and walls, dams, chimneys, etc. The first chapter in part three describes the material employed in the fabrication of reinforced concrete and throughout the chapter are dealt with the methods of construction of various classes of work.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

ALLEGED HOSTILITY TO U.S. MAGAZINES.

FOR some time past enquiries have been received from United States manufacturers and others regarding our position on the question of an alleged movement in Canada to keep out United States magazines. Regarding this we wish to state very emphatically that there is no such organized movement and any action that has been taken has not originated with publishers in Canada. Regarding our own position in the matter we are very much opposed to any movement reacting against the best publications in the United States, believing that Canadians should have the most liberal access to the best reading possible. A portion of a letter written by Col. J. B. MacLean, president of the MacLean Publishing Co., publishers of Canadian Machinery, who is himself a member of the executive of the Canadian Manufacturers' Association, to Mr. J. P. Murray, chairman of the Commercial Intelligence Committee of the C.M.A., will show the stand he takes in the matter.

"There is a matter which I think might be brought before the Commercial Intelligence Committee. The Canadian Government propose shutting out U.S. publications, trade newspapers, magazines and that sort of thing. I would probably benefit by such a policy more than anyone else in the country, owning as I do so many newspapers, but I think it is a very short-sighted policy on the part of the Government. By all means let them shut out the cheap and useless magazines, but I think it is to the advantage of our people, particularly of our business men, manufacturers, and their employes, to read the best that is published in the United States and Great Britain that they may be kept right up to the times in every particular in every department of manufacturing and selling of goods. We are doing a lot in this way in our own papers, but we cannot cover all the fields and we never hesitate to recommend or advise any of our readers anywhere in Canada to subscribe for and read the best publications in the United States.

"I think this is a matter the association should deal with and point out to the Government the inadvisability of such a course."

Considerable activity has been noticeable of late in the Post Office Department of both the United States and Canada, which has led up to the present condition of affairs. The most important move has been the abrogation by Canada of the post convention between the United States and Canada in so far as that convention relates to second-class matter. This will take effect next Spring. The original instrument was ratified in 1888, but it was amended two years ago so as to provide "for the right of each administration to decline to transmit through its mails, except when duly prepaid by stamps affixed in the country of origin at the rate applicable to miscellaneous printed matter, such newspapers and periodicals as it would decline to transmit through its mails under the statutory newspaper and periodical privileges accorded to publishers and newsdealers, if such newspapers and periodicals were published in its own country."

In abrogating the convention, Canada notifies the United States that, if by legislation new regulations are framed controlling the second-class matter in the United States, it will be prepared to enter upon negotiations for another convention relating to this class of matter.

Thus it will be seen that Canada is still ready to make another treaty as soon as the United States Government, by legislation, frames new regulations controlling second-class matter. It is over this point that the whole difficulty has apparently arisen, giving effect that Canada is antagonistic to United States publications. She is merely waiting until the United States Government frames new laws in this matter, at which time there is not the shadow of a doubt but that a suitable treaty will be made permitting of the entrance into Canada of reputable United States magazines on the same terms as they are received through the mails of the United States.

More than this, we have reason to believe on the authority of an official of the Canadian Post Office Department that it was on the suggestion of a high official in the U.S. Post Office Department at Washington that the Canadian Government has taken the action referred to above. This was evidently done to assist the U.S. authorities in some scheme which has not yet been made public.

READY FOR CANADIAN TRADE.

MR. L. Gerald Freedman of Melbourne, Australia, is at present in Canada studying the possibilities of Canadian trade with Australia. Mr. Freedman declares that an excellent market is open in a sister colony for Canadian manufactured articles, and expressed surprise that more effort was not made on the part of manufacturers in this country to secure some of this valuable trade. He emphasized the fact that the annual purchases of Australia amounted to $425,000,000 and that at present United States was aggressively supplying the demands in which Canadians should, at least, be taking an active part. The commercial conditions are such that an increased exchange of goods between the two countries should be materialized. At the present time motors of all kinds are very much in demand, agricultural implements, machine tools, power apparatus, leather products, furniture and all kinds of woodwork. He is satisfied that should Canadian manufacturers make a move in this direction they can without any great effort secure a large share of the Australasian trade.

CONTINUED INDUSTRIAL BOOM.

GREAT as was the industrial expansion in Canada during 1906 there is already every evidence that this will be greatly overshadowed by the progress of 1907. Already there is promise of the greatest year in railroad construction in the history of the country, almost every province in the Dominion receiving a share, but being particularly true of the west. Many large works are under way, particularly in the metal industries, giving promise of a development in this line hitherto unparalleled. Many United States firms have already intimated their intention to establish branch manufacturing plants in this country. Enough of interest has already been expressed and enough of confidence already assured to bring about what, under ordinary circumstances, might be considered an industrial boom, but what in Canada is the steady, progressive and solid development of a country whose resources are just being recognized.

One feature in connection with this is quite noticeable, being the stimulated interest on the part of municipalities to secure industries in their midst. An awakening along this line has been experienced that is reacting greatly to the benefit of towns that were hitherto indifferent regarding new industries. There are possibilities of development in the country at present that would warrant every town becoming a city, and with proper attention to their interests the citizens therein have every chance of either creating new industries or attracting them within their limits.

SENSIBLE TALK.

IT IS seldom that a manufacturer comes out in opposition to the protectionist policy, but R. T. Crane, of Chicago, takes thus unusual position in a recent article, discussing U.S. Senator J. J. Hill's recent plea for reciprocity in Canada. Mr. Crane is probably the largest manufacturer of valves and heating supplies in America, one of his company's many warehouses being located in Winnipeg.

Mr. Crane contends that "a large amount of trade with the Canadians has already been lost, and that much more is likely to be lost, by the stupid and short-sighted policy of our Congress in making the Dingley tariff law a bar to reciprocal trade relations, not only with Canada, but with every other foreign country. We deliberately took a course opposed to reciprocity at a time when Canada appeared to be entirely satisfied with its trade relations with this country, and thus lost the enormous advantage we then possessed, and it is now too late for us to try to re-establish our former position, much less to take advantage of the greatly improved conditions in the Dominion. In this case we have antagonized a neighbor that, by its geographical situation, ought to have been one country with the United States. There is no more sense in putting up trade barriers between Canada and this country than there would be in putting them up between Illinois and Indiana. Once we had committed ourselves to the Dingley tariff, we antagonized the Canadians, and they then swung sharply toward a fiscal policy of protection. This policy is now thoroughly and generally approved, and there is no prospect that the Canadians will change it."

Continuing, Mr. Crane points out that to change Canada's fiscal policy would be unfair to both Canadian manufacturers and to Americans, who have established factories in Canada, with the expectation that the policy would be permanent. He further argues that the high protective policy in the States is forcing manufacturers there to pay high prices for raw materials, this increase in manufacturing costs placing American goods at a disadvantage in foreign markets.

THE UNIVERSAL SPIRAL HEAD.—By John Edgar

(Continued from last issue.)

II.

IN THE former article the system of plain indexing was described. In this article we will take up the three remaining systems: The Direct, Compound, and Differential.

Direct Indexing.

The direct indexing system consists of the process of turning the spindle direct, without the interposition of any intermediates, as with plain indexing. the division being obtained by revolving the spindle and dropping a pin into a plate fast to it, the whole process being in direct dealing with the spindle. In ordinary cases the worm is dropped out of mesh with the worm gear, leaving the spindle free to be revolved at will depending entirely upon the hold that the under pin has on the plate. The plate is fastened to the front end of the spindle and is shown at (h) and the pivot

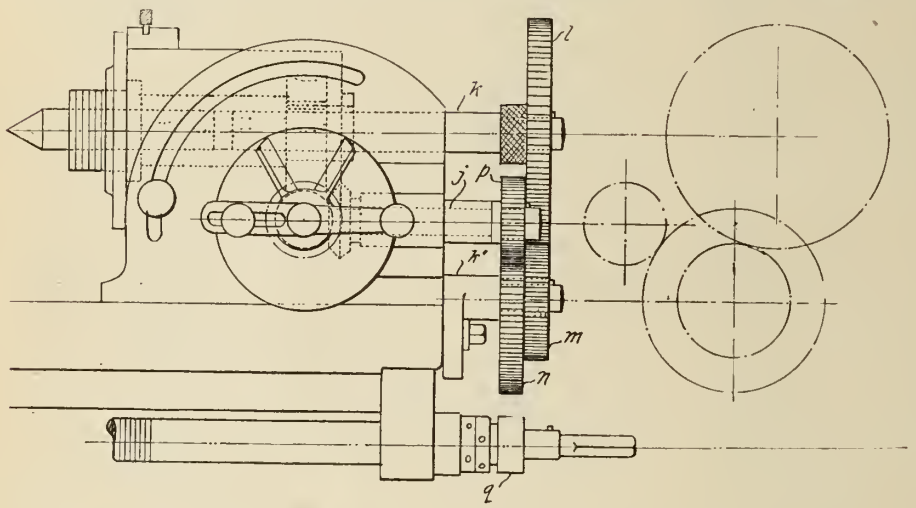

FIG. 5.

(i). The number of holes is usually small and is in all cases such that it is divisible by the common divisors; four, six and eight. This system is used for indexing very low numbers, and then only in cases where accuracy is not important. The necessity of dropping the worm out of mesh makes this system undesirable, although most heads are so arranged.

Compound Indexing.

The compound system of indexing is unimportant, as it is little used and has the very undesirable quality of being complicated and that exact results cannot be obtained in many cases, it being in a measure an approximate method.

In machines fitted for the compound method the index head has to be provided with two index pins, one on either side of the plate, and which must be used in conjunction in such a manner as to obtain a compound movement of the crank and plate.

One pin, that on the back of the plate, is so arranged that it may be adjusted so that any circle of holes may be used and at the same time hold the plate stationary when it is in the hole. The other pin is that in the index crank and is also adjustable. The plates must in this case be drilled through so that the pin may be used from behind.

It will be found that in plain indexing prime numbers and others not given in the tables can be obtained approximately by that (the plain) system. Thus in our example of 73 divisions in the former article we find from the table that 72 is the nearest number and is obtained by 15 holes in the 27 circle, each division is so much greater than it ought to be by 1-73 of a division. If the plate could be given a movement against the crank 1-73 of 15-27 turn for each division or at each indexing we would obtain the desired 73 divisions. This is the principle of compound indexing. The process as described above is very simple but other items enter into the problem such as limits in the number of holes in the plate, and the dividing of the periphery of a piece of work into a number of equal spaces whose number is prime is by no means a simple matter even by this compound method, it being necessary in some cases to go around the work a number of times in order to get the desired result, that is, the process is to set the index pin and take readings which give a lower number than that desired and by compounding the two movements get the number wanted by repeating the indexing until the work has revolved a stated number of times, instead of once as in plain indexing.

Thus, referring to our example again, we would set the spacer and pin to index 6 turns and 28 holes in the 47-circle and the back pin to take 1 hole in the 49-circle, working the plate in the opposite direction to that in which we turn the crank and repeat the operation until we had revolved the spindle twelve times. This method would give us a division within one ten-thousandth, or each division would be one seventy-third of one ten-thousandth too long, which is well within the limits of shop requirements. An exposition of how these prime numbers are figured would require so much space and would be of so little use to the busy shop man that no attempt will be made here to show any, and as the differential method, to be described in full, is much simpler and answers all the requirements which the compound method was devised to fill, the need of the latter method is overcome.

In the description of the mechanism of the head we stopped when the point had been reached where the head was complete so far as ordinary conditions of indexing were taken into consideration. We will now proceed with the description.

Mechanism of Head.

If on the inner side of the index plate we fix a bevel gear so that the plate and gear act as one and at the same time are loose on the worm shaft, and connect them by another bevel gear to the shaft, (Fig. 5), and by connecting this shaft and the lead screw by gearing, we have means of revolving the spindle of the head by power. The motion of this shaft and of the bevel gears and plate, is transmitted to the spindle by locking the plate and index crank together by means of the detent pin. This is the manner in which the spindle is driven in spiral milling. If on the other hand the index pin is withdrawn, the plate will still be driven by the gearing, but the spindle will remain stationary.

In plain indexing the plate is held in a stationary position by the back pin. If this pin is withdrawn and the index pin is also withdrawn the plate is free to revolve, carrying with it the shaft (j), which is connected with it by the bevel gears. By reversing the operation the plate may be revolved by means of the shaft (j). This at once gives us a method by which we can make up the desired advancement of the plate in or-

der to obtain the 73 divisions in our example. This advancement must be made by steps at each indexing and the plate held stationary at the interval between the indexings. This can be accomplished by gearing the spindle and the worm shaft (j), together with gears of the proper ratio to give the desired movement of the plate at each indexing of the work. This is accomplished by placing a plug (k) into the rear end of the spindle, which is provided with a taper hole, into which the taper end of the plug fits. The plug is made to receive the regular change gears on the outer end and is connected to the worm shaft (j), as shown in Fig. 5, by the gears, (l, m, n and p).

Differential Indexing.

The action of the device is as follows: The index crank is turned, causing the worm, worm gear and spindle to revolve. This in turn causes the plug (k) to revolve, turning the worm shaft the desired amount by means of the change gears, which, through the bevel gears, advances or retards the plate the fractional turn necessary to make up for the loss or gain in the indexing of the crank. The use of this device automatically makes up the error in the division which is being obtained by means of the ordinary plain indexing methods. The process is exactly the same as plain indexing so far as the operator is concerned, for after the gears are in place the simple movement of the crank, as in plain indexing, is made to take the place of the compound movements necessary in compound indexing. And by this method with the proper gearing we can obtain any division desired. This is differential indexing.

In machines which are equipped with this method of indexing the index table is so arranged that the readings given show the arrangement of gears for all numbers up to 360 degrees where they are necessary, otherwise the reading is given as in plain indexing.

Looking at one of these tables we find for our example of 73 divisions that we must take a 49-circle and move 28 holes at each indexing, and also that on the spindle plug (k) must be placed a 18-tooth gear; on the shaft (j) a 28-tooth gear, and that two idlers must be used in order to reach and have the plate turn opposite to the motion of the crank. The number of idlers needed depends on the head being used, the number given above being for example only.

If we move the crank 28 holes in a 49-circle, we move the spindle through $\frac{1}{40} \times \frac{28}{49}$ of a revolution, which is $\frac{1}{70}$, or if the gears were not in place we would, by carrying out the process, index 70 divisions. But we desire 73, so the plate must be moved in the opposite direction to that of the crank, enough so that the spindle loses 3-70 of a turn, or in other words, the plate must be given a backward movement equal to 3 divisions or 3x28 holes in the 49 circle.

The ratio of the gearing to connect the stud (k) and the shaft (j) must be proportioned so as to accomplish this. One division is obtained by 28 holes on the 49 circle, so that 3 divisions equal three times that amount, which is

$$3 \times \frac{28}{49} = \frac{84}{49} \text{ or } \frac{12}{7}$$

The gear on the spindle stud (k) must have 12 teeth to every 7 in the gear on the worm stud (j), which is met by the gears given in the table, namely, 48 and 28, respectively. After the gears are in position all that is necessary is to manipulate the crank as in plain indexing, the process being simple in comparison with the compound movements necessary in the compound method. By this differential method there is less danger of making blunders, which are easy enough made without increasing the ratio of such chances.

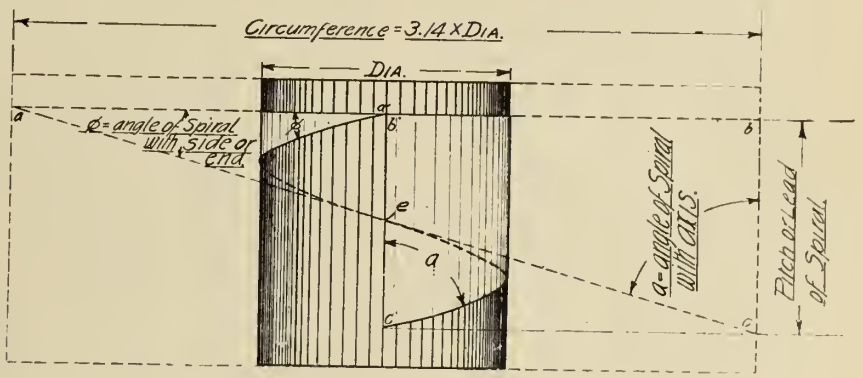

FIG. 6.

The gearing used in the above example is simple, while Fig. 5 shows compound gearing in place. The compounding of gears is done to increase the ratio of the driver to the driven when the distance between the centres is short, so short that simple gearing would not be practical. In compound gearing we have two simple trains of gears which when used in combination give the desired ratio, thus if we had two simple trains whose ratios were 1 to 3 and 1 to 5, respectively, we would have by using as a compound a whole ratio of 1 to 15, or by inversing one train we would obtain the ratio of 3 to 5. The compound gears are keyed to a sleeve so that they act in unison. The gear (n) is termed the "first gear on stud," and the gear (m) the "second gear on stud." The gear (p) is called the "gear on worm" because it drives the worm and the gear (l), the "gear on spindle." Sometimes it is necessary to have a compound gear and still have the driver and driven gear turn in opposite directions. This is accomplished by placing an idle gear between the gear on worm and the second gear on stud, or between the gear on spindle and the first gear on stud.

Care should be exercised in having the gears properly in mesh so that no backlash occurs between the teeth, as it is liable to lead to error in the division.

It will be noticed that the spindle cannot be elevated at an angle when this arrangement is used, making it impossible to cut bevel gears by this method, nor can it be used in cutting spiral gears or other work of the character, as the worm shaft is connected with the spindle, making a locked train, even could connection be made with the screw which under the conditions shown is impossible. However, the method presents enough merits to allow these few unimportant points being scored against it.

Spiral Cutting.

Having described the principles of and the means by which we may calculate the necessary data for obtaining any number of divisions, either by the method of plain indexing or the differential method, we will next turn our attention to the problem of spiral cutting and explain the principles of and give a few simple rules and methods by which the necessary gears may be found and the other data that is necessary in setting the machine for this class of work.

The principle on which the spiral head depends is the same as that applied to the lathe in chasing threads, but the action is just the reverse,; the spindle drives the screw on the lathe, but the spiral head spindle is driven from the lead screw of the milling machine.

(To be Continued.)

On the Art of Cutting Metals

By F. W. Taylor—(Continued from last issue.)

The author of the paper thinks that the time is fast going by for the great personal or individual achievement of any one man standing alone and without the help of those around him. And the time is coming when all great things will be done by the co-operation of many men in which each man performs that function for which he is best suited, each man preserves his own individuality and is supreme in his particular function, and each man at the same time loses none of its originality and proper personal initiative, and yet is controlled by and must work harmoniously with many other men.

He has great confidence in the good judgment and common sense of mechanics in the long run, but as a class they are extremely conservative, and if left to themselves their progress from older towards better methods will be exceedingly slow; and his experience is that rapid improvement can only be brought about through constant and heavy pressure from those who are over them. It must be said therefore that to get any great benefit from the laws derived from these experiments, the slide rules prepared by the author and his colleagues must be used, and these slide rules will be of but little, if any, value under the old style of management, in which the machinist is left with the final decision as to what shape of tool, depth of cut, speed, and feed, he will use. The slide rules cannot be left at the lathe to be banged about by the machinist. They must be used by a man with reasonably clean hands, and at a table or desk, and this man must write his instructions as to speed, feed, depth of cut, etc., and send them to the machinist well in advance of the time that the work is to be done..

A long time will be required in any shop to bring about this radically new order of things; but in the end the gain is so great that the author says, without hesitation, that there is hardly a machine shop in the country whose output cannot be doubled through the use of these methods. And this applies not only to large shops, but also to comparatively small establishments.

Results of Experiments.

The conclusions arrived at as a result of the experiments along different lines are given in brief form, as stated by the author, under the explanatory headings:

Standard Shop Tools.

In our practical experience in managing shops we have found it no easy matter to maintain at all times an ample supply of cutting tools ready for immediate use by each machinist, treated and ground so as to be uniform in quality and shape; and the greater the variety in the shape and size of the tools, the greater becomes the difficulty of keeping always ready a sufficient supply of uniform tools. Our whole experience, therefore, points to the necessity of adopting as small a number of standard shapes and sizes of tools as practicable. It is far better for a machine shop to err upon the side of having too little variety in the shape of its tools rather than on that of having too many shapes.

Tip, Clearance and Angle of Tools.

Contrary to the opinion of almost all novices in the art of cutting metals, the clearance angle and the back slope and side slope angles of a tool are by no means the most important elements in the design of cutting tools, their effect for good or evil upon the cutting speed and even upon the pressure required to remove the chip being much less than is ordinarily attributed to them.

The following are our conclusions regarding the clearance angle of the tool.

(a) For standard shop tools to be ground by a trained grinder or on an automatic grinding machine, a clearance angle of 6 degrees should be used for all classes of roughing work.

(b) In shops in which each machinist grinds his own tools a clearance angle of from 9 to 12 degrees should be used.

The following are the conclusions arrived at regarding the angles at which tools should be ground:

(a) For standard tools to be used in a machine shop for cutting metals of average quality: Tools for cutting cast iron and the harder steels, beginning with a low limit of hardness, of about carbon 0.45 per cent., say, with 100,000 pounds tensile strength and 18 per cent. streteh, should be ground with a clearance angle of 6 degrees, back slope 14 degrees, giving a lip angle of 68 degrees.

(b) For cutting steels softer than, say, carbon 0.45 per cent. having about 100,000 pounds tensile strength and 18 per cent. stretch, tools should be ground with a clearance angle of 6 degrees, back slope of 8 degrees, side slope of 22 degrees, giving a lip angle of 61 degrees.

(c) For shops in which chilled iron is cut a lip angle of from 86 to 90 degrees should be used.

(d) In shops where work is mainly upon steel as hard or harder than tire steel, tools should be ground with a 5 degrees, side slope 9 degrees, giving a clearance angle of 6 degrees, back slope lip angle of 74 degrees.

(e) In shops working mainly upon soft steels, say, carbon 0.10 per cent. to 0.15 per cent., it is probably economical to use tools with lip angles keener than 61 degrees.

(f) The most important consideration in choosing the lip angle is to make it sufficiently blunt to avoid the danger of crumbling or spalling at the cutting edge.

(g) Tools ground with a lip angle of about 54 degrees cut softer qualities of steel, and also cast iron, with the least pressure of the chip upon the tool. The pressure upon the tool, however, is not the most important consideration in selecting the lip angle.

Forging and Grinding Tools.

The following are the important conclusions arrived at upon this subject:

(a) The shapes into which the tools are dressed and the ordinary methods of dressing them are highly uneconomical, mainly because they can be ground only a few times before requiring redressing.

(b) The tool steel from which the tool is to be forged should be one and one-half times as deep as it is wide.

(c) To avoid the tendency of the tool to upset in the tool post or under, under pressure of the cut, the cutting edge and the nose of the tool should be set well over to one side of the tool.

(d) Tool builders should design lathes boring mills, etc., with their tool posts set down lower than is customary below the centre of the work.

(e) In choosing the shape for dressing a tool, that shape should be given the preferenee in which the largest amount of work can be done for the smallest combined cost of forging and grinding.

(f) Forging is much more expensive than grinding, therefore the tool should be designed so that it can be ground: (a) the greatest number of times with a single dressing; and (b) with the smallest cost each time it is ground.

(g) The best method of dressing a tool is to turn its end up high above the body of the tool. Tools can be entirely dressed by this means in two heats.

The following are the important conclusions arrived at with reference to grinding tools :

(a) More tools are ruined in every machine shop through over heating in grinding than from any other cause.

(b) The most important consideration is how to grind tools rapidly without overheating them.

(c) To avoid overheating, a stream of water amounting to five gallons per minute should be thrown, preferably at a slow velocity, directly on the nose of the tool where it is in contact with the emery wheel.

(d) To avoid overheating where tools are ground by hand or with an automatic tool grinder, the surface of the tool should never be allowed to fit closely against the surface of the grindstone. To prevent this, tools should be constantly moved or wobbled about during the operation of grinding.

(e) To lessen the danger of overheating on the emery wheel and to promote rapid grinding, tools should be dressed so as to leave the smith shop with a clearance angle of about 20 degrees, while 6 degrees only is needed for cutting.

(f) Flat surfaces upon tools tend far more than curved surfaces to heat tools in grinding.

(g) Tools with keen lip angles (i. e., steel side slopes) are much more expensive to grind that blunt lip angles.

(h) It is economical to use an automatic tool grinding machine even in a small shop.

(j) There is little economy in an automatic grinder for any shop unless standard shapes have been adopted for tools, and a large supply of tools is kept always on hand in a first-class tool room so that tools of exactly the same shape can be ground in quite large batches or lots.

(k) Corundum wheels made of a mixsure of grit size No. 24 and size No. 30 are the most satisfactory for grinding ordinary shop tools.

(l) In grinding flat surfaces skilful hand grinders invariably keep the tool wobbling about on the face of the grindstone in order to avoid heating.

Cooling the Tool With Heavy Stream of Water.

Cooling the nose of a tool by throwing a heavy stream of water or other fluid directly upon the chip at the point where it is being removed from the steel forgings enables the operator to increase his cutting speed about 40 per cent. The economy realized through this simple expedient is so large that it is a matter of the greatest surprise that the experimenters on the art of cutting metals have entirely overlooked this source of gain.

The following are the important conclusions arrived at as to the effect on the cutting speed of cooling the tool with a heavy stream of water :

(a) With high speed tools a gain of 40 per cent can be made in cutting steel or wrought iron by throwing in the most advantageous way a heavy stream of water upon the tool.

(b) A heavy stream of water (3 gallons per minute) for a 1-inch by 2½-inch tool and a smaller quantity as the tool grows smaller, should be thrown directly upon the chip at the point where it is being removed from the forging by the tool. Water thrown upon any other part of the tool or the forging is much less efficient.

(c) With modern high speed tools a gain of 16 per cent. can be made by throwing a heavy stream of water on the chip in cutting cast iron.

The gain for the different types of tools in cutting steel is :

(a) Modern high speed tools, 40 per cent.;

(b) Old style self-hardening tools, 33 per cent.;

(c) Carbon tempered tools, 25 per cent.

Chatter of the Tool.

The following are the general conclusions arrived at in regard to this question :

(a) Too small lathe-dogs or clamps or an imperfect bearing at the points at which the clamps are driven by face plate produce vibration.

(b) To avoid chatter, tools should have cutting edges with curved outlines and the radius of curvature of the cutting edges should be small in proportion as the work to be operated on is small.

(c) Chatter can be avoided, even in tools with straight cutting edges by using two or more tools at the same time in the same machine.

(d) The bottom of the tool should have a true, solid bearing on the tool support which should extend forward almost directly beneath the cutting edge.

(e) The body of the tool should be greater in depth than its width.

(f) It is sometimes caused by badly made or fitted gears.

(g) Shafts may be too small in diameter or too great in length.

(h) Chatter of the tool necessitates cutting speeds from 10 to 15 per cent slower than those taken without chatter whether tools are run with or without water.

The Effect of Feed and Depth of Cut on Cutting Speed.

The following are the principal conclusions arrived at on this subject:

(a) With any given depth of cut metal can be removed faster, i.e., more work can be done, by using the combination of a coarse feed with its accompanying slower speed than by using a fine feed with its accompanying higher speed.

(b) The cutting speed is affected more by the thickness of the shaving than by the depth of the cut. A change in the thickness of the shaving has about three times as much effect on the cutting speed as a similar or proportional change in the depth of the cut has upon the cutting speed. Dividing the thickness of the shaving by 3 increases the cutting speed 1.8 times while dividing the length that the shaving bears on the cutting edge by 3 increases the cutting speed 1.27 times.

(c) Expressed in mathematical terms the cutting speed varies with our standard round-nosed tool approximately in inverse proportion to the square root of the thickness of the shaving or of the feed, i.e., S varies with $\sqrt{F}$ approximately.

(d) With the best modern high speed tools, varying the feed and the depth of the cut causes the cutting speed to vary in practically the same ratio whether soft or hard metals are being cut.

(e) The same general formula expresses the laws for the effect of depth of cut and feed upon the speed, the constants only requiring to be changed. This is a matter of very great importance, and it enables us to use a single slide rule as a means of finding the proper combination of speed and depth of cut and feed for all qualities of metal which may be cut.

(f) The same general type of formula expresses the laws governing the effect of the feed and depth of cut upon the cutting speed when using our different sized standard tools. This is also fortunate as it simplifies matematical work in the final solution of the speed problem.

COPPER FAMINE.

A copper famine is impending owing to the enormous demand for the metal at home and abroad. The demand is due to the great growth of electrical work all over the world. Manufacturers of electrical machinery say that the demand for their products is unprecedented. Authorities in the copper trade say it is doubtful if the output of copper this year will show a material increase over that of 1905. The scarcity of skilled miners has handicapped the larger producers and consequently has reduced production. It is also likely that the Chilian production will be materially reduced by the recent earthquake.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

WIRE NAIL MACHINERY. Bulletin No. 30 of the National Machinery Co., illustrating and describing the National wire nail machinery.

INTEGRATING WATTMETERS. Booklet of the Canadian Westinghouse Co., Hamilton, illustrating and describing type C. integrating wattmeters.

STARTING AND FIELD RHEOSTATS. Circular No. 1139 of the Canadian Westinghouse Co., Hamilton, illustrating and describing their starting and field rheostats.

AKRON FRICTION CLUTCH. Catalogue of the Akron Clutch Co., Akron, O., illustrating and describing in detail the Akron friction clutch. The catalogue is standard size.

CALYX CORE DRILLS. Catalogue No. 91, issued by Ingersoll, Rand Co., New York, describing the Davis calyx diamondless core drill. Views are shown of this drill in actual operation.

CONE GAS GENERATOR. Catalogue of the Cone Gas Machine Co., Detroit, Mich., illustrating and describing the Cone gas generator. It is well illustrated and contains a detail description of the plant.

ENGINE LATHES. A well illustrated catalogue issued by the Fairbanks Machine Tool Co., Springfield, Ohio: describing their engine lathes. The illustrations are of detail parts as well as of general views.

GAS ENGINES. Handsome and well-illustrated catalogue of the Bruce-Meriam-Ahhott Co., Cleveland, O., description of their gas and gasoline engines for electric lighting, pumping and general power purposes.

GAS ENGINES. A high-class 28-page catalogue is being issued by the Bruce-Meriam-Abbott Co., of Cjeveland, Ohio. This firm makes a wide variety of high-class gas and gasoline engines, several types of which are illustrated.

UNIVERSAL CUTTER AND TOOL GRINDER. Standard sizes catalogue of the Dayton Machine & Tool Works, Dayton, O., illustrating and describing their universal cutter and tool grinder. The catalogue is well illustrated.

FRICTION CLUTCH. Folder describing the Clarke improved friction clutch now being manufactured in Canada by William and J. G. Greey, 2 Church St., Toronto. This is a line which has lately been taken up by this firm.

FOUR SPECIALTIES. A folder, issued by F. L. Patterson & Co., 86 Victoria St., Toronto, Ont., describing four steam specialties manufactured by them. These include feed water heater and purifier, a steam separator, exhaust heads and Patterson helt pump.

STILL MORE SUGGESTIONS. As in previous years the Canadian Westinghouse Co., have issued an attractive hanger containing pithy paragraphs for manufacturers and business men. It makes an attractive wall hanger and a world of wisdom is contained in the paragraphs.

CANADIAN FAIRBANKS CO. Catalogue F. of the Canadian Fairhanks Co., Ltd., descriptive of power transmission appliances. This is their general power transmission catalogue, and is very complete in every respect, containing 111 pages, 6x9 inches, and a complete index.

PNEUMATIC TOOLS. The Globe Pneumatic Engineering Co., 150 Queen Victoria St., London, E.C., have sent catalogue describing some of their many lines of pneumatic tools. The illustrations are good and many tools are shown in actual operation. Forty-three pages, 8¼x10¾.

SMART & BROWN, of Erith, Kent, Eng., are sending out a folder illustrating their milling and wheel cutting attachments, also folder describing the colonial three-cylinder motor manufactured by this firm, being recommended as an ideal motor to drive a centrifugal pump or dynamo.

HIGH GRADE MACHINE TOOLS. An interesting little 24-page catalogue issued by the London Machine Tool Co., Ltd., Hamilton, Can., illustrating and describing various lines of their high-grade machine tools. Any one interested in machine tools will receive a copy on application to the above firm.

UNIVERSAL TOOL GRINDER. A very handsome and well illustrated catalogue illustrating and describing the Universal tool grinder of the Gisholt Machine Co., Madison, Wis. The catalogue is printed in two colors, and contains valuable information as well as fine illustrations of this grinder.

HANDY DESK CALENDAR. The Owen Sound Iron Works Co., engineers, founders, machinists and boiler makers, of Owen Sound, Ont., have issued a very attractive desk calendar, containing an adjustable card for the various months. It is of convenient size and makes an attractive addition to any desk.

FANCY CALENDAR. Allis-Chalmers-Bullock, of Montreal, have issued their 1907 calendar in the form of their well-known trademark shield. Besides a bird's-eye view of their works it contains various coats of arms of the different provinces in colors. The whole presents a handsome appearance, the general effect being pleasing in the neatness and general artistic arrangement.

BOILER FEED WATER HEATERS. The Loew Mfg. Co., Cleveland, Ohio, have issued a 31-page catalogue descriptive of their feed water heaters. Several lines are illustrated, views being given showing the large-size work done by this firm. These heaters possess some very distinctive features, as outlined in the catalogue, which may be had on application to the above firm.

WIRES AND CABLES. Supply catalogue, section 7, of the Canadian General Electric Co., Toronto, Ont. This catalogue is printed the same size as their regular engineering bulletin and may he filed in the same holder. Various styles of insulated wires and cables are illustrated and described. At the back some very interesting information is given, including tables of wiring, resistances and the rules of the National Board of Fire Underwriters.

THE WESTINGHOUSE DIARY for 1907. The Canadian Westinghouse Co. have the thanks of many of their friends, who were remembered at the beginning of the year with a copy of their handsome, high-class little diary for the year 1907. Besides a regular diary, with pages for addresses and memoranda, it contains a great deal of valuable information in the electrical field, the same being in concise form and handy for ready reference. A copy of this will no doubt be highly prized hy those fortunate enough to receive one.

SHEFFIELD CALENDAR. A very neat calendar of a most sensible sort has been issued by Sybry, Searls & Co., Ltd., Cannon Steel Works, Sheffield. The upper part of the card shows three views of the interior and exterior of the works, and the calendar portion has the business man's week from Monday to Saturday on separate sheets with small blanks for memoranda each day. The reverse side contains a great deal of information of interest to metal workers. No doubt the publishers would be glad to send copies to any readers who make application.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

A FOUNDRY RIG.

By Thomas Mack.

THE accompanying illustrations show a convenient sweeping rig, to which may be attached various strike boards, the striking edges of which contain radial sections of the pieces to be swept up. As the stroke boards are rigidly and permanently secured together with cleats, they can be attached to or removed from the rig very quickly as the case may require, no special adjusting being necessary. The advantages of the rig can readily be seen, for if a casting is

Fig. 1

to be duplicated all that is necessary is to go to the pattern storage, get the strike boards, and attach them to the rig.

The blocks B-B, upon the cleats which secure the boards together, guide the parts into their correct position upon the rig.

The rig is shown as applied to the sweeping up of a green sand mold for producing a dome casting, as shown in half section and half elevation in Fig. 1.

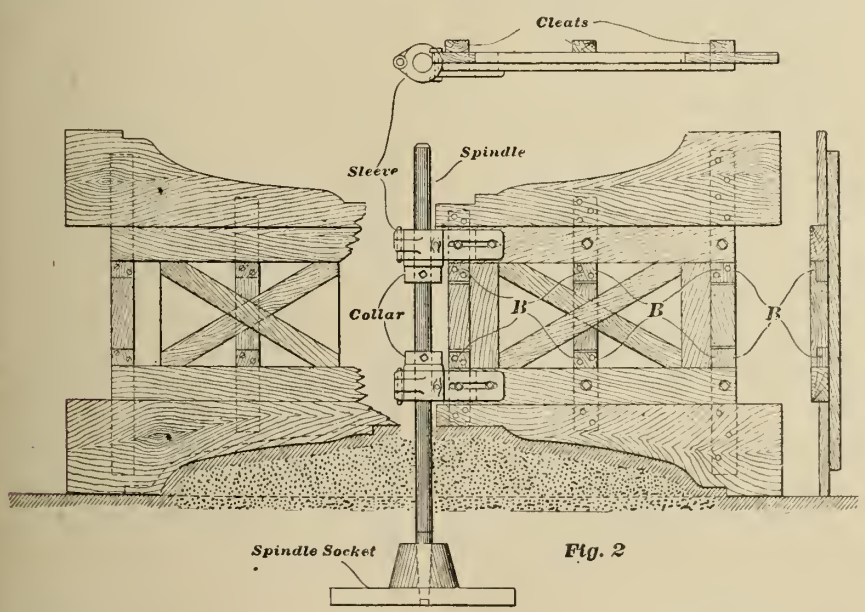

Fig. 2

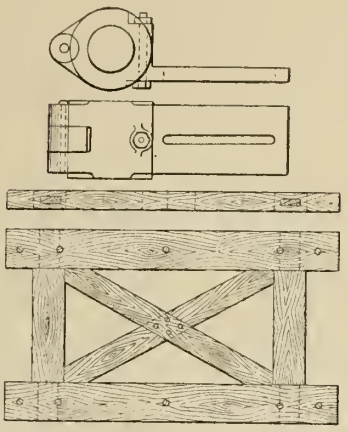
The assembled arrangement of the rig with the strike boards attached is shown in Fig. 2. At the right of the spindle the operation of sweeping the exterior form of the dome is shown in progress. Upon this sweep surface the cope is subsequently rammed up. At the left of the spindle the rig is shown in the reverse position or upside down, as when set for sweeping off the metal thickness or striking up the interior form of the dome. Of course, the striking up of the interior form takes place after the ramming up and lifting off of the cope.



The separate parts of the arrangement are shown in Fig. 3. The rig itself is shown at the left, and consists of a rigid frame made from 3½ x 1½-inch material, the frame being strengthened by cross braces, as shown. The spindle sleeves are of the hinge design, as this form of sleeve allows the rig to be attached to or detached from the spindle without disturbing the latter; that is, the spindle can be set up and adjusted and the rig attached afterward. The sleeve is shown in greater detail above the frame. At the right of Fig. 3 are shown the strike boards as they would appear when removed from the

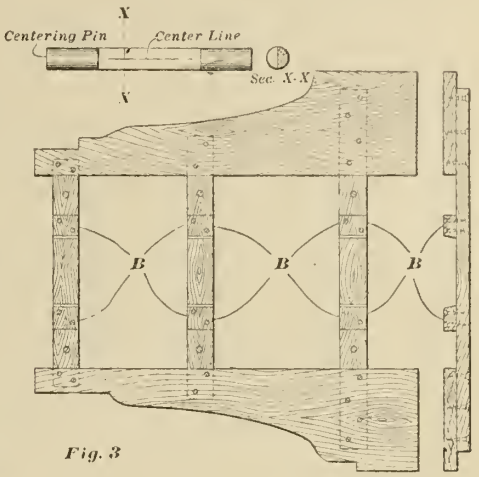


Fig. 3

rig. Care should be taken in attaching boards together to see that they are rigidly secured to the cleats with screws and a spot of glue at the extreme ends of the cleats. There are two advantages in this manner of gluing. First, any shrinkin or swelling that may take place in the boards will be toward or from the glue spots at the ends of the cleats and will prevent the striking edge of the boards being distorted. Second, if glue was applied to the portion of the cleats extending across the boards, warping of the boards would be the result. In fitting the boards to the frame the latter is laid down and the boards with the striking edge dressed to form, placed in about their correct position and the cleats attached. Next the centering pin shown directly above the striking boards in Fig. 3 is used in locating the blocks B-B, Figs. 2 and 3. These blocks should be securely fastened in place with glue and screws. The centering pin is usually turned up from well-seasoned hardwood, its diameter being the same as that of the spindle. A portion of the centre is cut out to half the diameter and the center line of the pin scribed thereon. By shoving the pin through the sleeves as if it were the spindle and turning the flat side of the pin into the plane of the striking boards, the center line upon the pin becomes immediately available for setting the boards.—The Foundry.

POWER REQUIRED BY VARIOUS MACHINE TOOLS.

APPROXIMATE power ratings of electric motors which have been applied and actually operated on the machine tools mentioned are given in the following table. By referring to this table anyone can arrive approximately at the power required for operating any particular tool.

Niles 96 in. driving-wheel lathe, chain connected, 10 hp. Group, overhead belted. Niles 42 in. engine lathe, emery wheel; Craven quartering machine, 5 hp. Niles double axle lathe, chain connected, 7½ hp. Niles 48-in. car wheel lathe, chain connected, 10 hp. Sellers planer 54-in x 54 in., belted overhead, 10 hp.

Niles 8-ft. boring mill, chain connected, 10 hp.

Niles 8-ft. wheel lathe with quartering attachment, variable-speed motor, chain connected, 10 hp.

For driving quartering attachment to this lathe, two motors, chain connected, 3 hp.

Fairbain, Kennedy & Naylor 72-in. driving wheel lathe, belted overhead, 7½ hp.

Putnam 79-in. driving-wheel lathe, belted overhead, 7½ hp.

Niles 96-in. driving-wheel lathe, chain connected, 10 hp.

Group, belted overhead. Becker Brainerd No. 6 vertical miller; Becker Brainerd No. 7 vertical miller; emery wheel; Niles 30-in. shaper; Bement Niles No. 2 Cotter drill; Niles vertical boring mill; Niles 24-in. drill press; Niles 4 spindle drill, 15 hp.

Niles double axle lathe, chain connected, 7½ hp.

Niles 48-in. car-wheel borer, for driving tool, chain connected, 7½ hp.

For driving hoist—geared, 3 hp.

Niles 48-in. hydraulic wheel press, belted overhead, 5 hp.

VALUE OF BABBITT METAL.

Babbitt metal is a composition that is used extensively as a substitute for brass in the lining of journal bearings, says the Valve World. To make such a bearing, the shaft for which it is required is placed in position in its recess or cavtiy, and then the melted babbitt metal is poured in around it and allowed to cool, thus forming the bearing for the shaft. The value of babbitt metal for this purpose lies in the fact that it has all the merits of brass as a wearing material, and at the same time melts at a much lower temperature; and also being of a very fluid nature when melted, it may be poured into the cavities around the shaft and the expensive operation of fitting brass to these places thus be dispensed with. What is called the "genuine," or superior babbitt metal is described under the heading of Tin Alloys. But there are a variety of cheaper grades of this material, in which lead is very extensively used alloyed with antimony, or with antimony and tin. While these compositions are not so good as the "genuine," they are of sufficient merit for a large variety of cheap machinery, and are extensively used in the repairing of agricultural implements, and other grades of cheap machinery. An immense quantity of the combination of lead and antimony is produced by the silver smelters, a market for which is found in the production of babbitt metal.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

FERRO-ALLOYS.

By A. E. Outerbridge, Jr.

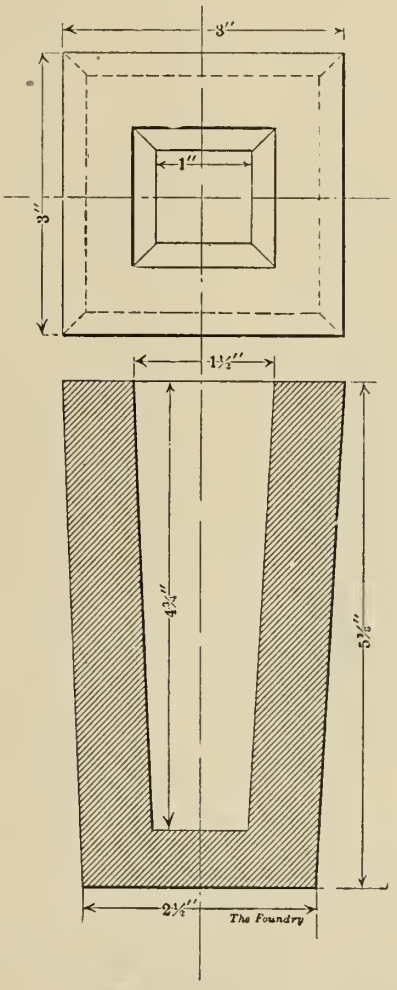
THE use of ferro-alloys in the foundry is likewise extending. The simple method first described in the address given before the metallurgical section of the institute a year ago for softening iron for castings to any desired degree has been continued, with exceedingly beneficial results.

The speed of turning pulleys has been largely increased and the time required to complete the machine work upon them has been reduced, and in other light castings as well. In addition to the material improvement in the strength of the metal by this treatment, there is a decided decrease in the shrinkage, so that some castings of irregular shape which are difficult to make without cracking in cooling, owing to unequal strains, are now made without this tendency by this process. Other advantages accruing from the addition of a very small amount of high-grade ferro-silicon (containing about 50 per cent. silicon) have been observed. Among these may be mentioned the cleaning action upon the molten metal which the alloy effects by its deoxiding influence. Singularly, also, it is found that commercially pure silicon does not produce these results, neither does the ordinary grade of ferro-silicon, containing about 20 per cent. of silicon.

The samples cast in sand are all perfectly gray, but there is an appreciable difference in the fracture, the treated metal showing softer iron than the untreated sample.

The metal selected for this particular test was comparatively low in silicon, consequently having comparatively high chilling property, but this fact would never be suspected from an examination of the fracture of the test sample cast in sand. Very few ptactical founders are aware of the large variation in chilling property of their iron, sometimes of presumably similar grades, melted on different days, or even of the wide variations which may occur in different portions of one heat. The chill cup test here shown is an invaluable instructor in this matter, and without its aid the beneficial effects of adding high-grade ferro-silicon to molten cast iron could not have been so readily detected and exhibited. These chill magnifiers have been used with great benefit in daily practice more than twenty years. They are far more effective than the ordinary chill tests made in car wheel foundries. Such tests are only applicable for very high chilling iron, while the cup tests here described are only intended for use with comparatively low chilling irons.

In the case of pure silicon the specific gravity of the material is too low and its melting point too high to permit it to become incorporated with the molten



Cup for Chilling Test Bars.

iron in the ladle, in the other case the proportion of silicon is too low to permit a sufficient amount to be dissolved in the iron to produce a radical change in its quality without causing dull iron in the ladle.

There is no doubt but that when the merits, simplicity, certainty of action and other advantages of this process of treating molten iron in the ladle are better known and appreciated it will come into very extensive use, for it enables the founder to modify the character of his iron to suit individual castings, a matter of considerable importance and value. This is accomplished without expense, for the cost of adding silicon to the iron in this manner is actually less than by the usual method of adding an equal amount of silicon to the iron in the form of pig iron, comparatively high in silicon, added in the cupola. For example, pig iron containing six per cent. of silicon costs at the present time, let us say, $22.50 per ton, and we may estimate for comparative purposes $3.75 per unit of silicon; ferro-silicon containing 50 per cent. of silicon costs at the present time in powdered form $100 per ton, or $2 per unit of silicon on the same basis of calculation.

Furthermore, there is no loss of silicon when added in the ladle, as there is when melted in the cupola, and this partly accounts for the fact that a given quantity of silicon, when added in the ladle, is much more effective as a softener than the same quantity charged into the cupola. Silicon added in the cupola always weakens the iron, while silicon added in the ladle always strengthens it.

CRANDALL CUPOLA.

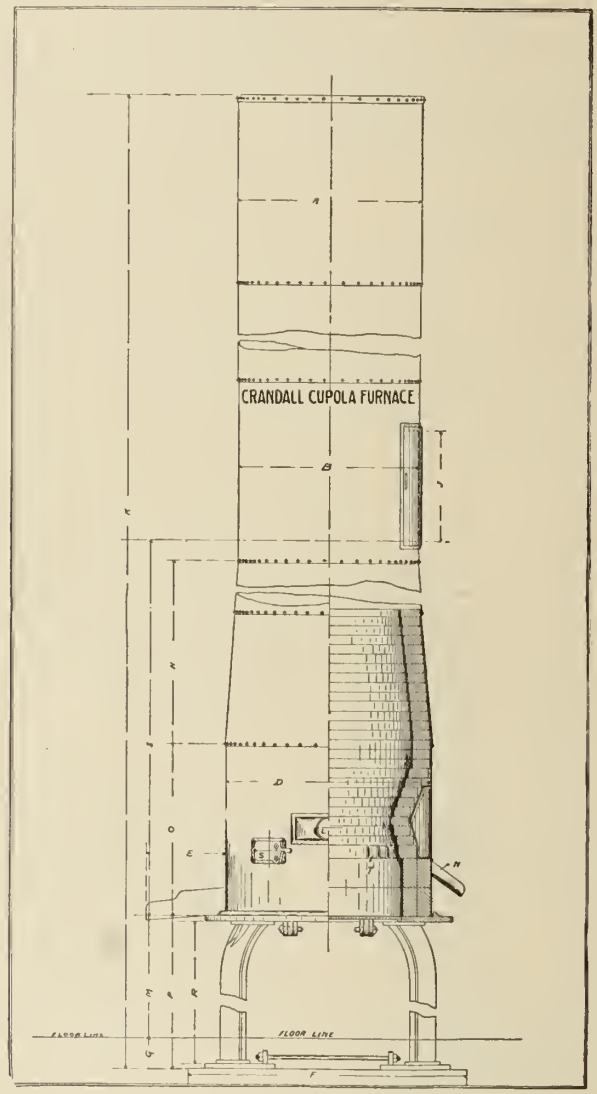
IN designing this cupola Mr. L. A. Crandall had in view economy of fuel, the most perfect combustion, and fluid iron in the shortest space of time. In placing this cupola on the market the Detroit Foundry Supply Co. of Detroit, Mich., and Windsor, Ontario, are offering the foundry public something with many points of excellence and superiority.

The air chamber being on the inside rather than outside of the shell enables the forming a "bosh" along the same lines as a blast furnace. With the best point of combustion in the centre, it naturally follows that in this cupola with the air chamber in the inside of the shell much nearer centre is attained than with straight line cupolas. In the bed of the cupola the greatest amount of fuel is used. The area of a straight lined cupola of 55 inches in diameter, inside 6 inches lining, is 1385.4 square inches. The standard size cupola requires a bed of coke to 20 inches above the upper tuyeres, which will be

about 52 inches for this size. This height multiplied by 1385.4 gives cubic feet of area, equals 7,204 cubic inches and this divided by 65 gives the weight of coke necessary for the bed (65 cubic inches is the space a pound of coke will occupy in a cupola). A Crandall cupola 55 inches in diameter has an average diameter inside of 6 inches brick lining of 37 inches or 1075.2 square inches in area. Distance bed to 20 inches above tuyeres is 40 inches. This height multiplied by area give 4,300 cubic inches, which, divided by 65, gives 662 lbs. of coke, or a saving of 447 lbs. to each heat.

This cupola at the melting point is the same diameter inside of brick lining as in the straight lined cupola, and will melt equally as much iron per hour with the eceonomy in coke to the users, advantage. Having a slight taper from bottom of charging door to melting point any possibility of charges hanging up is prevented. The charging door made of heavy screening will not allow of heat coming through the charging door owing to radiation of wire. Nor will it burn out as will a solid door, making it very convenient for the charger or melter as he is able at all times to see into the cupola without the annoyance of excessive heat.

Mr. Crandall, the inventor of this cupola, is not a theorist but has manufactured, operated and sold cupolas for 20 years, which places him an authority in the cupola business. Further information regarding this will be given by the Detroit Foundry Supply Company, Detroit, Mich.

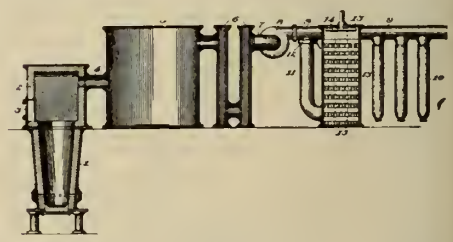


Crandal Cupola.

NEW WAY TO TREAT SCRAP BRASS.

A method of treating scrap brass has been patented by Henry J. Krebs of Wilmington, Del. (U.S. Patent 831,010, Sept. 11, 1906), which may be of interest to scrap manufacturers who desire to investigate the recovering of the zinc which always volatilizes when brass is melted. While this process is intended to treat the brass primarily for the recovery of the oxide of zinc, the same principle may be used for the recovery of the oxide of zinc in brass melting.

The principle of the appliance and process will be seen in the illustration. A cupola (1) is used for melting the brass. The blast of air that is used in the cupola oxidizes the zinc in the brass and the oxide of zinc passes to the chamber (2). This chamber is intended to divert the oxide of zinc in the cooling chamber (5). Auxiliary cooling chambers (6) are also provided through which the fumes pass. These chambers are directly connected to an exhaust fan (8) and then the fumes pass to a tower (15) which is filled with brickwork similar to an acid tower. An acid solution, say sulphuric acid, is sprayed through pipes 13 and 14 and converts the oxide of zinc into sulphate of zinc. From the tower the fumes pass to bags (10) which catch any excess of oxide of zinc which passes through the tower. A valve (12) may control the passage of the fumes so that only a portion is



Arrangement for Saving Oxide of Zinc in Brass Melting.

obtained as sulphate of zinc while the rest are obtained in the bags.

In order to use an appliance of this nature in the recovery of the oxide of zinc which escapes in brass melting, it would be necessary to use an exhaust fan in the flue of the furnace as natural draught would otherwise be choked so that it would be difficult to obtain the necessary heat in the melting furnaces.

AN ENQUIRY.

W. J. Hepburne, 223 McCaul St., Toronto, wishes to know where he can purchase finished gyb keys. There are several manufacturers of these in Canada, who will no doubt be anxious to attend to Mr. Hepburne's requirements.

The election of officers of the Canadian Railway Club held recently resulted as follows: Mr. W. Kennedy, master mechanic, Grand Trunk Railway, President; Mr. W. R. McRae, master mechanic, Toronto Railway Company, First Vice-President, and Mr. R. Preston, master mechanic, Canadian Pacific Railway, Second Vice-President.

The workman who takes a real interest in his work doesn't have to spend much time looking for a job.

Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

LIFTING BY THE HEAD.

By R. Manley Orr, Brantford.

A FEW days ago I saw an engineer trying to lift the cap off his main bearing with a rope and a couple of pulleys which he had rigged up as shown in Fig. 1. He pulled on the rope at A till he lifted himself clear off the floor but could not raise the cap. By jerking down with his whole weight he could just jerk up the cap about one-quarter of an inch; and there he was stuck. After he had tugged away in vain for a while I suggested that he make a change in his rig and attach the pulley C to the beam and the pulley B to the cap and then get up on the beam himself and try pulling up; just the reverse of the arrangement which he had. He soon had the change made as shown in Fig. 2, and found that the cap came up easily. After a little study

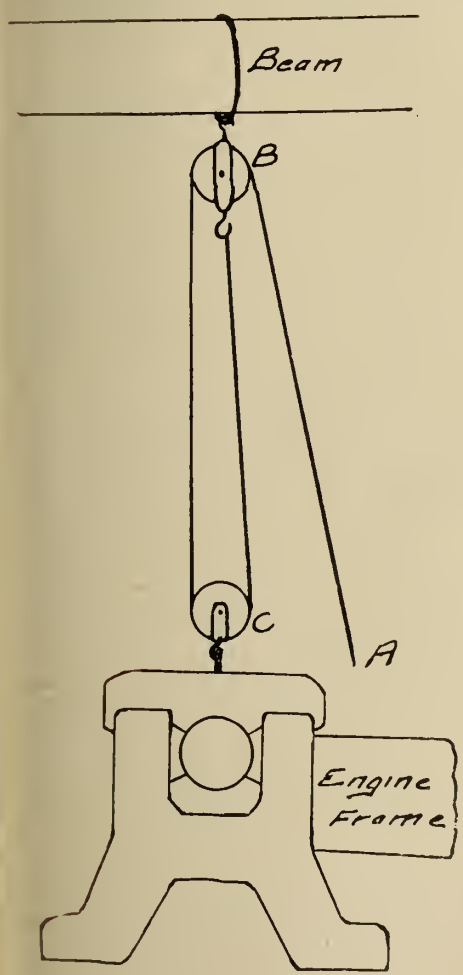


Fig. 1.

he figured that he could lift half as much again by the arrangement in Fig. 2, as by the arrangement in Fig. 1. That engineer was myself and I am learning that in working about machinery one can sometimes lift more with their head than with their hands.

OILING LOOSE PULLEYS.

By L. Bailey, Hamilton.

UNDER the head of Tricks of the Trade I would like to say for the benefit of those who may have had some trouble with loose pulleys that I have had a lot of

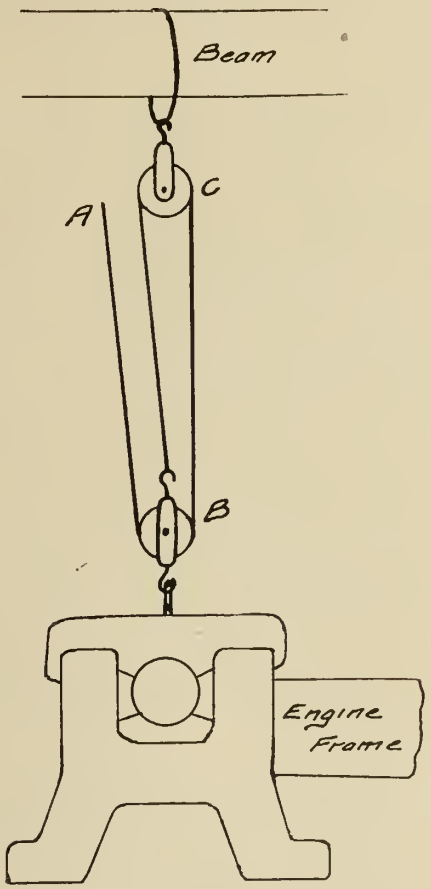

Fig. 2.

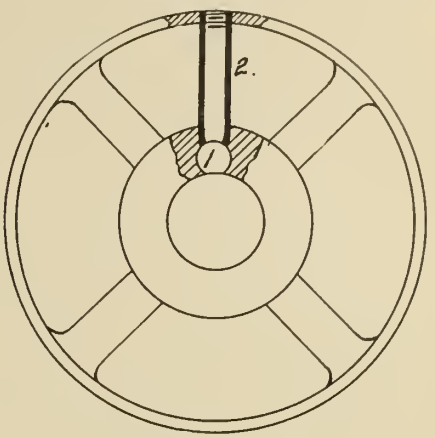
difficulty with loose pulleys that run at a high speed in getting the oil to stay in and oil the shaft properly, but at last I struck a scheme that has proved to be just the thing, and a glance at the accompanying sketch will explain the trick.

It will be seen at Fig. 1 is a hole drilled right through the hub of the pulley and Fig. 2 is a piece of $\frac{1}{4}$-inch brass tube with a grub screw in the outer end to keep the oil from coming out. The hole that is drilled in the hub just breaks through into the pulley bore and a piece of candle wick pulled through the hole absorbs the oil that is put into the brass tube. And so the wick coming in contact with the shaft keeps a perfect lubrication on the rame.

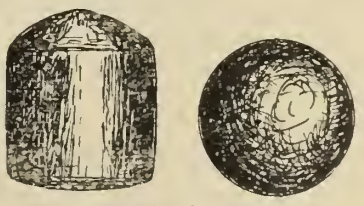


Oiling Loose Pulley.

WHAT ARE THEY ?

By F.C.D W., Brantford.

I don't think that many at first sight (even if they could see the pieces themselves) would be able to spot just what they were, or where they came from. These two bits shown in the figure are two pieces of common babbit metal taken from a broken bearing. Some time ago I had occasion to oversee the removal of a 7-inch shaft from the power house of the Western Counties Power Co.'s power house. On removing the cap from one of the large bearings we found the babbit very badly broken. A cul-de-sac had been formed by a piece falling down until it rested against the babbit in the body of the bearing and in this space we found these two pieces. One is almost a perfect sphere and the other is perfectly cylindrical, having one end pointed and the other rounding off. At first I couldn't see just how these were formed, but the point on the one piece gave me a clue. The piece that had fallen down had been over two anchor holes, and these two pieces had been sheared off when it was forced down by the shaft, and had fallen out



What Are They?

of the holes to be turned around by the shaft in every direction until the sphere was formed. The cylindrical piece was just too long to be turned in more than one direction, hence it could only assume the cylindical form.

Practical Questions and Answers

Production of Pisten Rings.

Ques.—What are the different operations involved in the making of piston and piston valve rings ?

Ans.—The making of piston and piston valve rings involves several processes of an interesting nature. The machining operation commences on a cylindrical casting, which casting always has lugs cast on one end by which it can be chucked to the face-plate of a lathe to be bored and turned. In ordinary practice the boring of the outside and inside diameters of the cylinder is done as two separate operations. But both of these operations can be proceeded with simultaneously by employing two cutter bars and tools. The cylinder is held to the face-plate, and the two cutter-bars are strapped to a flanged plate, which is tongued and fitted into a T slot on the tool rest. The cutter-bars are placed parallel with the length of the cylinder, one being inside and one outside the cylinder. The tools are fitted into the ends of the cutter-bars, and are adjusted to the cut by means of adjusting screws operating on the cutter bars.

The inside and outside surfaces of the casting having been turned up, the face of the cylinder is trued up. Then the casting is ready for the cutting off of the rings. This may be done with an ordinary parting tool, or with a double-tongued parting tool, one tongue to regulate the width of the ring cut-off. The ring, having been cut off, the new face exposed by the operation is trued up, and another ring parted from the cylinder. Some of the double-tongued parting tools are made adjustable.

The unfinished side of the rings are trued by chucking them in the jaws of an ordinary lathe chuck and in a special expanding chuck made for the purpose.

The cylinder from which packing rings are parted is always turned larger than the bore of the cylinder in which the rings are to work. The amount of this enlargement is equal to one-third of whatever metal is cut away in splitting the ring, The old practice of splitting rings was to cut a piece out of the ring in a straight line, but at an angle to the surface of the ring. The ring was then sprung into the cylinder, and the high places filed down until there was a fit. But that practice is now obsolete. The modern practice is to divide the amount to be cut out between the two sides of the ring. By this method the ring is equal to a solid ring, if the joint is well made. The rings are now chucked, and turned to fit the cylinder. The most efficient way to hold the rings together while they are being chucked is by means of a clamp, instead, as is done often, riveting together the tongues formed in the rings by the cutting. The rings are usually turned in pairs.

Sometimes packing rings are made thick on one side and thin on the other side of their diameter, and then afterwards split on the thinnest side, on the supposition that when the ring is sprung into place in the cylinder it will expand equally in all directions, thereby maintaining a true circle at all parts of the diameter. This form of packing ring has, however, fallen into disuse, they not having given the satisfaction expected of them.

Size of Ropes and Pulleys for Rope.

Ques.—Can you give any hints regarding the relative size of pulleys and ropes for the most efficient rope drive ?

Ans.—The size and number of ropes as well as the least diameter of the pulley for any given power are points of importance, and should be considered for each case. It is better to use small ropes, consistent with not having too many in the space available. There is less internal friction with small ropes than large ones, and hence greater efficiency and endurance. For a main drive where the pulleys are seldom less than 5 feet in diameter, $1\frac{3}{4}$-inch ropes are most usually employed. The least size of the pulley should not be less than thirty times the diameter of the rope.

Allowance for the Machining of Forgings

Ques.—In good practice what allowance is made for the machining of forgings ?

Ans.—There is considerable difference of opinion regarding the allowance necessary for the machining of forgings, but a good rule to be adopted is to allow $\frac{1}{4}$-inch for forgings up to 5 inches in diameter, $\frac{3}{8}$-inch for pieces ranging from 6 inches to 8 inches, $\frac{1}{2}$-inch for 9 inches to 10 inches, and 1 inch for 1 foot.

High Compression in Gas Engines.

Ques.—Can you furnish me with data regarding the high compression of the explosive mixture in gas engines ?

Ans.—In these columns of the September, 1906, issue, some information is given on this subject, and some experiments conducted by Prof. Burstall, of Birmingham University, are quoted. Additional information along this line is quoted from R. E. Mathot's book on Gas Engines and Producer Gas Plants." He says :

In actual practice the problem of high pressures is apparently very difficult of solution, and many of the best firms still cling to old ideas. The reason for this course is perhaps to be found in the fact that certain experiments which they made in raising the pressures resulted in discouraging accidents. The explosion-chambers became over heated; valves were distorted; and premature ignition occurred. Because the principle underlying high pressures was improperly applied, the results obtained were poor.

High pressures cannot be used with impunity in cylinders not specially designed for their employment ; and this is the case with most engines of the older type, among which may be included most English, French, and particularly of American construction. In American engines notably, the explosion-chamber, the cylinder and its jacket are generally cast in one piece, so that it is very difficult to allow for the free expansion of certain members with the high and unequal temperature to which they are subjected.

Some builders have attempted to use high pressures without concerning themselves in the least with a modification of the explosive mixture. The result has been that, owing to the richness of the mixture, the explosive pressure was increased to a point far beyond that for which the parts were designed. Sudden starts and stops in operation, overheating of the parts and even breaking of crank-shafts, were the results. The engines had gained somewhat in power, but no progress had been made in economy of consumption, although this was the very purpose of increasing the compression.

High pressures render it possible to employ poor mixtures and still ensure ignition. A quality of street gas, for example, which yields one horsepower per hour with 17.5 cubic feet, and a mixture of 1 part gas and 8 of air compressed to 78 pounds per square inch, will give the same power as 14 cubic feet of the same gas mixed with 12 parts of air and compressed to 171 pounds per square inch.

"Scavenging" of the cylinder, a practice which engineers of modern ideas seem to consider of much importance, is better effected with high pressures, for the simple reason that the explosion-chamber, at the end of the return stroke, contains considerably less burnt gases when its volume is smaller in proportion to that of the cylinder.

In impoverishing the mixture to meet the needs of high pressures, the explo-

sive power is not increased and in practice hardly exceeds 365 to 427 pounds per square inch. With the higher pressures thus obtained there is no reason for subjecting the moving parts to greater forces.

The increase in temperature of the cylinder-head and of the valves, due wholly to high compression, is perfectly counteracted by an arrangement which most designers seem to prefer, and which consists in placing the mixture and exhaust valves in a passage forming a kind of anti-chamber completely surrounded by water. The immediate vicinity of this water assures the perfect and equal cooling of the valve seats. ..... It is advisable to run the producer gas engine "colder" than the older street-gas type, in which the more economic speed is that at which the water emerges from the jacket at about a temperature of 104 degrees F. It would seem advisable to meet the requirements of piston lubrication by reducing to a minimum the quantity of heat withdrawn by the circulating water.

For street-gas engines, however, the cylinders should be worked at the highest possible temperature consistent with the requirements of lubrication. It should not be forgotten that, in large engines fed with producer gas, economy of consumption is a secondary consideration, because of the low quality of fuel required.

ACTIVITY AT NIAGARA FALLS.

The Canadian Nut & Bolt Co. have decided to build a factory at Niagara Falls to employ 50 men. Already they have contracts for a large supply of nuts and bolts for the Canadian Ramapo Iron Works, which is also established in that city. A factory for the manufacture of automatic fire shutters is also to be started. Silver plating has been undertaken by the Wm. Rogers Co. The Niagara Falls Machine & Foundry Co. have secured a large contract to supply cast and wrought iron work for the new Detroit River tunnel, and another to supply fire hydrants to the city of Toronto. Their plant will be enlarged at once.

ELECTRICAL ASSOCIATION QUESTION BOX

A. A. Dion, of Ottawa, has sent to the members of Canadian Electrical Association question blanks to be filled in with any questions members of the association desire to have answered. This feature of the meetings of the Canadian Electrical Association has in the past been of the greatest help and benefit to its members, and the editor is looking forward to an even more liberal interest than heretofore in this department.

PERSONAL MENTION

Mr. Peter Eyermann, one of the foremost gas engine authorities, designers and engineers from Germany, has been appointed chief of the Engineering Dept. of the DuBois Iron Works.

Professor Louis Hurdt of McGill University, Montreal, together with Wm. Kennedy, hydraulic engineer of Montreal, and H. N. Ruttan, city engineer of Winnipeg, have been appointed a Power Committee by the city of Winnipeg, to act as a consulting board in connection with the power projects of that city.

The appointment of Mr. A. Gaboury to the position of superintendent of the Montreal Street Railway is an evidence of the possibilities before a young man of intelligence and energy. In twelve years Mr. Gaboury has risen step by step from a most humble position in the company to be superintendent of the entire system.

Mr. Charles Brandeis, consulting engineer of Montreal, has recently been appointed controlling engineer to the Minister of Public Works and Labor at Quebec. This appointment means a tribute to the high standing Mr. Brandeis is achieving in professional work. He is at present in Cuba on a two weeks' trip.

Mr. S. W. Smith, formerly with the Canadian Westinghouse Co. in their Montreal office, has accepted the position of Ontario representative for the Packard Electric Co., of St. Catharines, with headquarters at Toronto. Mr. Smith has many friends in Toronto and throughout Ontario, who will be glad to notice his appointment to this position and it is safe to predict that the interests of the firm will be well looked after under the management of Mr. Smith.

Mr. W. H. Banfield, of W. H. Banfield & Sons of 120 Adelaide St. West, Toronto, has just returned from a trip to the United States, and whilst there he purchased a complete outfit of canning machinery for the Western Canning Co., Ltd., of Winnipeg. The bulk of the order was placed with Torris Wold & Co., of Chicago, Ill., the machinery purchased being similar to that used in the Swift Co. Banfield & Sons are making a specialty of this class of goods, and have already done considerable business in the various canning factories in the Dominion. They are also making arrangements to represent Torris Wold, for Canada.

T. Gerald Freedman, a director of the Buyers and Sellers of Australasia Co., Ltd., with head office at Melborne, Australia, spent some days in Toronto recently and was a welcome visitor at the office of Canadian Machinery. Mr. Freedman has just completed a tour of the United States studying manufacturing conditions, and came to Canada with a view to getting in touch with the manufacturing interests of this country, being particularly interested in the development of Canadian export trade to Australia. The American office of this company is at 1269 Broadway, New York, where they will be glad to receive communications from any manufacturers in Canada desirous of increasing or opening up trade with Australia.

Successful Draftsmanship.

Many men wish over and over again that they had a working knowledge of drafting and a more intimate insight into the reading of mechanical drawings. This is particularly true of mechanical men who have not had an earlier opportunity of making good along this line.

MR. FRED. DOBE.

It has created a longing on the part of some to better their position, and oftentimes a feeling of embarrassment at not being able to make a simple sketch or a correct drawing.

Mr. Fred Dobe, M.E. and chief draftsman of the Engineers' Equipment Company, 97 Washington Street, Chicago, has for a long time been making a practice of giving personal and individual instructions in complete architectural as well as mechanical drawing and designing, and is prepared to accept a few more students old or young. His instructions are given by mail, but must not be compared with the ordinary correspondence school instructions, as all the work is laid out personally by himself and prepared especially for individual requirements. With this method he is able to satisfy and educate any experienced or absolutely inexperienced man, who is willing to better himself. He sells no diplomas, but insists on your work being a more practical diploma and to do the talking, and guarantees by contract to

qualify you in a few months' instruction to be able to hold a first-class draftsman's position and instruct you until you are competent. He furnishes free this month only, without extra cost, a complete and highest grade full drawing outfit, including finest set of German silver tools worth $13.85. His book, "Successful Draftsmanship," size 6x9, is sent free with full particulars for four cents in stamps to cover cost of mailing.

New District Manager.

Recognition of his ability and excellent work done in the service of the company has come to Mr. W. Archie Duff, assistant manager of the Montreal Office of the Canadian Westinghouse Co., in his promotion to the western managership with headquarters at Winnipeg. Mr. Duff has spent many years able service in the Westinghouse interests and this well

MR. W. A. DUFF,
New District Manager of Canadian Westinghouse Company.

merited promotion is appreciated by his many friends throughout the country. Mr. Duff is a graduate of McGill University in electrical engineering, and his past experience together with natural ability in engineering work eminently qualify him for the position he now holds. Mr. Duff is well known in the electrical engineering field and carries to Winnipeg the best wishes of all his friends in the east. He is a brother of Mr. Melville Duff of the C. P. R. Steamship Service.

Mr. Thos. R. Loudon, B. Sc., of Toronto, has been appointed general manager and secretary of the Canadian McVicker Engine Co., of Galt, Ont. Mr. Loudon's previous experience should admirably fit him for this position.

Prominent Manufacturer Dead.

Manufacturers throughout Canada will regret to learn of the rather sudden death a week ago of Leonard McGlashan, of Niagara Falls. With a party of relatives and friends he had gone to California a month ago to enjoy the milder winter climate of the Pacific coast, but on his arrival there was taken ill with typhoid fever, the disease which caused his death. Mr. McGlashan was 61 years of age and besides a widow, leaves a daughter and one son, L. Lee McGlashan, of the McGlashan-Clarke company, Niagara Falls, manufacturers of cutlery and silverware.

Mr. McGlashan was probably the wealthiest citizen of Niagara Falls and was one of the first users of power from Niagara River, besides being interested in many enterprises, including mines and railways in the southwestern states and Mexico, and was a large real estate owner. He was until recently the chief owner of the Ontario Silver Company, which had a large factory at Thorold, then at Humberstone and finally located in Niagara Falls, where it is an important industry. Mr. McGlashan sold out his interest to the International Silver Company some time ago, and since then the McGlashan-Clarke Company was formed and built the large works at Niagara Falls, which commenced operations only a month or so ago.

A Manufacturing Mayor.

At the election for the office of mayor for Owen Sound on Jan. 7th, Mr. Mathew Kennedy of Wm. Kennedy & Sons of that city was elected to the position by a large majority. With Mr. Kennedy's broad business experience and large interests there and public spiritness the the citizens of Owen Sound are assured of their interests being well looked after for the coming year.

VOTES ON PUBLIC IMPROVEMENTS

The councils of a large number of Ontario cities and towns submitted by-laws at the municipal elections on Jan. 7, to raise money by way of debentures for various improvements. In the majority of cases these by-laws were carried.

Southampton decided to raise $5,000 to extend the waterworks system.

Napanee passed by-laws to improve the town's sewerage.

Waterloo voted 390 for and 74 against the sewer commission proposal, and also carried a by-law for a $23,000 loan for sewer farm improvements.

St. Catharines voted favorably for extension of the waterworks.

Listowel decided by 17 votes to raise $14,500 to construct new bridges.

Brantford carried sewer extension by-law.

Almonte decided to appoint an electric light commission.

Kincardine carried the Grand Trunk station, Coleman, and Park by-law.

Woodstock endorsed by-laws to establish a parks commission and to raise $20,000 for sewer extensions.

In a quiet vote Guelph took a jump forward in its municipal government by deciding in favor of commissions to manage its waterworks and gas and electric light plants. The vote for the waterworks commission was 1,132 for, 376 against; for gas and electric light commission, 1,104 for 371 against, and to loan $25,000 to enable Morlock Bros. to extend their factory, 966 for, 159 against.

Renfrew, by a vote of 136 to 103, de-

THE LATE LEONARD McGLASHAN.

cided to raise $6,000 for sewer extensions, and the county system of good roads was carried, 171 to 65.

Bowmanville decided to have its waterworks managed by a commission.

ENGINEERS' CLUB OFFICERS.

At the election of officers at the Engineers' Club of Toronto, which took place Thursday, Jan. 10th, the following were elected: President, C. B. Smith; First Vice-President, J. G. Cing; Second Vice-President, A. B. Barry; Secretary, Willis Chipman; Treasurer, John S. Fielding; Chairman of Rooms Committee, C. M. Caniff; Chairman of Library Committee, A. F. Macallum; Chairman of Papers Committee, R. G. Black; Auditors, W. E. Douglas and W. H. Patton.

Power and Transmission

Steam Gas Electricity Compressed Air Water

DODGE FRICTION CLUTCHES.

DURING the working hours, when the engine or other prime mover is in continuous motion, some of the driven machinery may be required to run all the time; all of it is presumably supposed to run some of the time; but not all of it can commonly be expected to run all the time.

The ordinary shipping belt is an entirely satisfactory arrangement for starting and stopping individual machines of comparatively light power requirements, and even heavier ones whose continuity of operation is only occasionally disturbed. But when larger power units — whether individual machines, groups of machines, or whole departments of a plant—frequently or even at longer intervals must be isolated as power users from the remainder of the system, then the shipping belt is not the thing.

These conditions, as well as any others wherein convenience of manipulation for any item or section of a system is a factor, are satisfied most readily, and sometimes only, by the use of the friction clutch in some form. For moderate powers, in cases where the periods of idleness are comparatively small, the pulley, sheave, sprocket or gear may be fitted to the sleeve of a clutch on the continuously moving shaft. Larger power units are properly cared for only by the quill, running in its own bearings, the shaft passing freely through its hollow centre. Where division of a line of shafting into successive sections will satisfy the conditions, the clutch coupling or cut-off clutch is properly used.

Thus, by intelligent planning of any new system or alteration of an old one, this desirable feature of providing means for throwing any unit or section into or out of service at will may be secured.

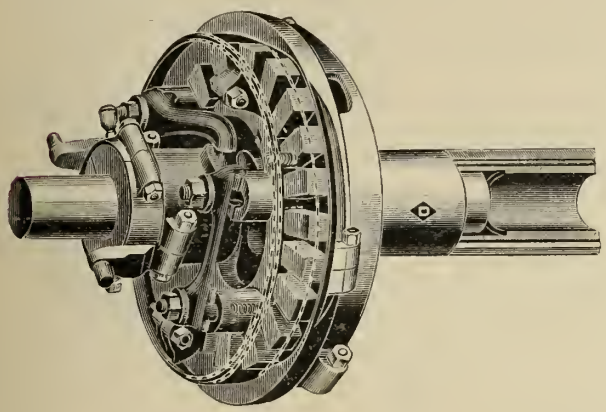


FIG. 1.

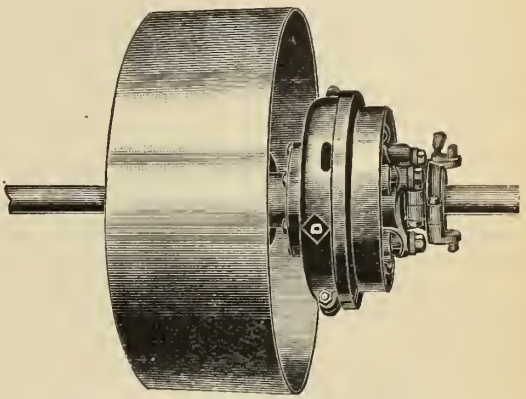

FIG. 3.

Waste of power, undue wear, loose pulley nuisances, squealing of belts in shipping and other familiar troubles almost inseparable from the "good old way" of doing things, are largely eliminated when the Dodge split friction clutch is properly used.

Fig. 1 represents the Dodge slip friction clutch. In this great frictional power is secured from the very nature of its construction, consisting of a disc into which are driven hard maple blocks, presenting end grain to inside and outside driving plates and powerful levers for forcing the plates into contact with the wooden block. Power is thus transmitted to the clutch sleed or to the next shaft section, if the clutch be used as a coupling.

Fig. 2 shows a phantom view of a 60-inch heavy Dodge slip friction clutch capable of transmitting 1,200 h.p. at 250 revolutions per minute.

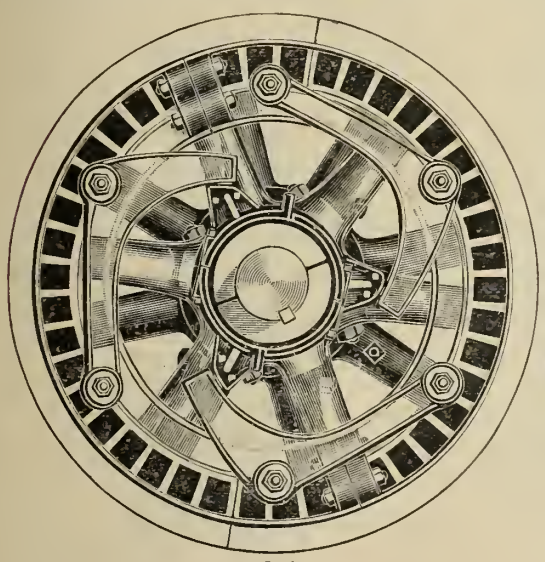

FIG. 2.

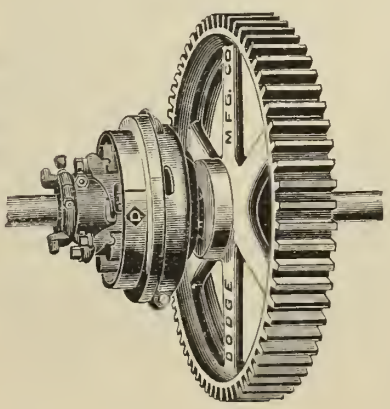

FIG. 4.

FIG. 5

Fig. 3 shows the clutch used in combination with an iron pulley, and Fig. 4 with a spur gear on the extended sleed. Fig. 5 shows the Dodge split friction clutch used as a cut-off coupling, and Fig. 6 Dodge solid friction clutch and cut-off coupling. Further information regarding these may be had from the Dodge Mfg. Co., Toronto.

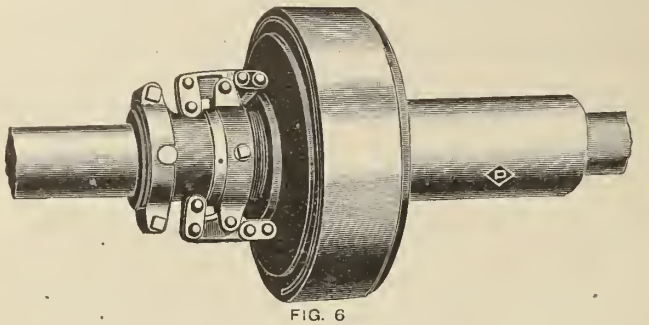

FIG. 6

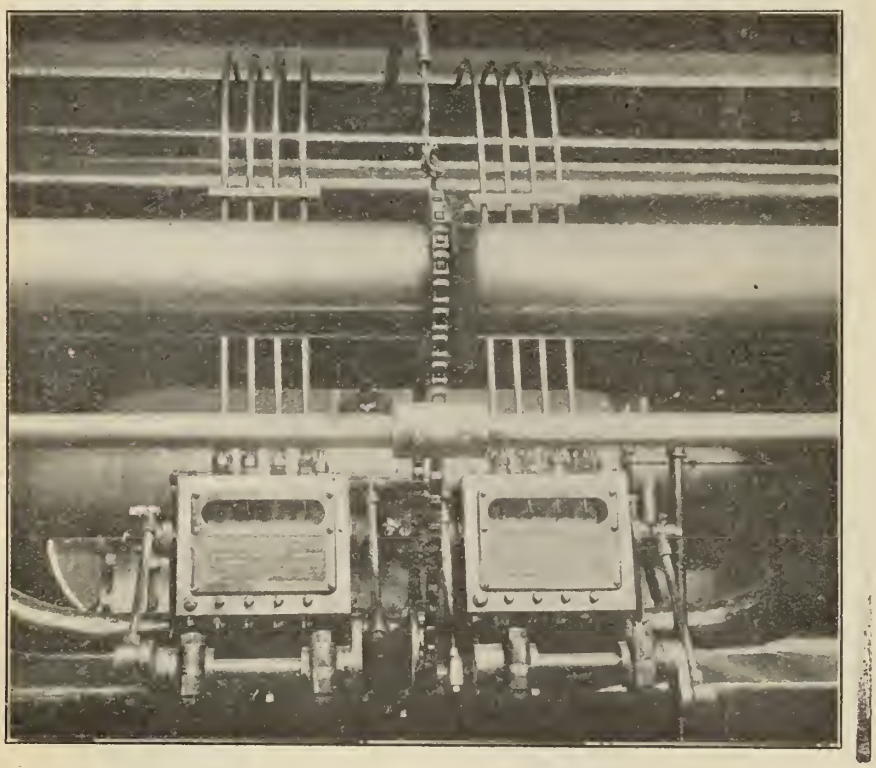
SIGHT FEED OIL PUMP.

A SIGHT feed oil pump manufactured by the Sight Feed Oil Pump Co., of Milwaukee, Wis., is shown in the accompanying illustration. This pump was built for use on a 22-inch by 48-inch double tandem horizontal gas engine of 1,000 h.p. The pump as shown lubricates one side of the engine, that is to say, a pair of tandem cylinders, requiring therefore two such outfits to lubricate the entire engine of 1,000 h.p. The apparatus consists essentially of two 4-foot pumps, mounted upon one large oil tank. Each one of these four feed pumps has the driving mechanism so arranged that two feeds are driven by each lever, that is to say, each pump is really divided in two. The small lay shaft just below the pump has four driving pins set 90 degrees apart and is driven by a chain from the main engine valve lay shaft in synchorism with the same. The sprocket wheel on the valve lay shaft is held by a clamp and may be advanced or retarded to produce the required timing of the pump.

By this combination it is enabled to introduce the oil upon the moving piston at the instant it will do most good. Two feeds are led to each end of each cylinder and the oil is introduced on the piston through two check valves of special construction, which are placed at an angle of 30 degrees each side of the vertical. The pumps are so timed that delivery of oil through these valves is commenced just as the piston comes underneath the oil port, and continues during the time that the piston travels toward the end of the cylinder and until this port is again uncovered, thus thoroughly lubricating the piston rings. The reciprocating motion of the piston then distributes this oil over the cylinder walls from end to end.



Sight Feed Oil Pump.

FEED WATER HEATERS.

FEED water heaters in two types as manufactured by the Loew Mfg. Co., Cleveland, Ohio, are illustrated herewith, these being the Loew vertical open boiler feed water heater and purifier, in sizes about 800 h.p., and the Loew closed boiler feed water heater, vertical type, showing the groups of tubes.

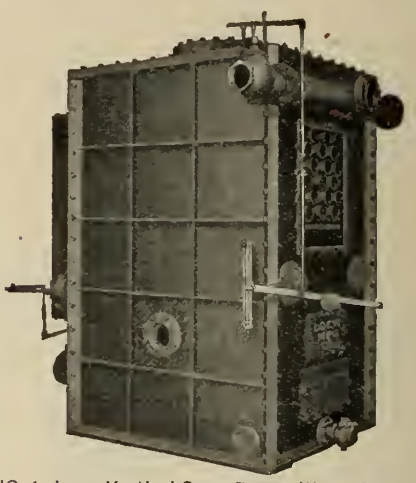


FIG. 1—Loew Vertical Open Boiler, Water Heater and Purifier.

The standard open type is used in connection with engines exhausting free to the atmosphere. The other style, known as the receiving type, is used in connection with engines exhausting into heating systems of various kinds, being equipped with a steam trap. The tendency heretofore has been to filter the feed water downwards which causes the

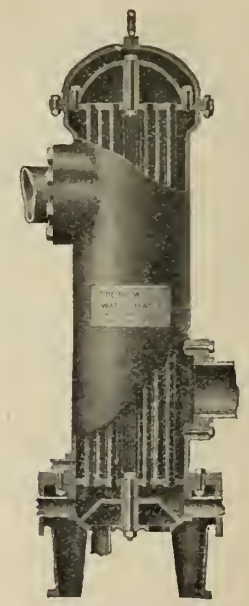

FIG. 2 - Loew Vertical Type Closed Feed Water Heater.

substances held in suspension to be deposited on the filter bed, forming a white scale over the surface of and clogging the filter bed. In the Loew the filter bed is located directly above the second storage chamber, supported on a cast iron frame. The pump draws the water upward through the filter bed, thus overcoming the disadvantages that exist in other heaters.

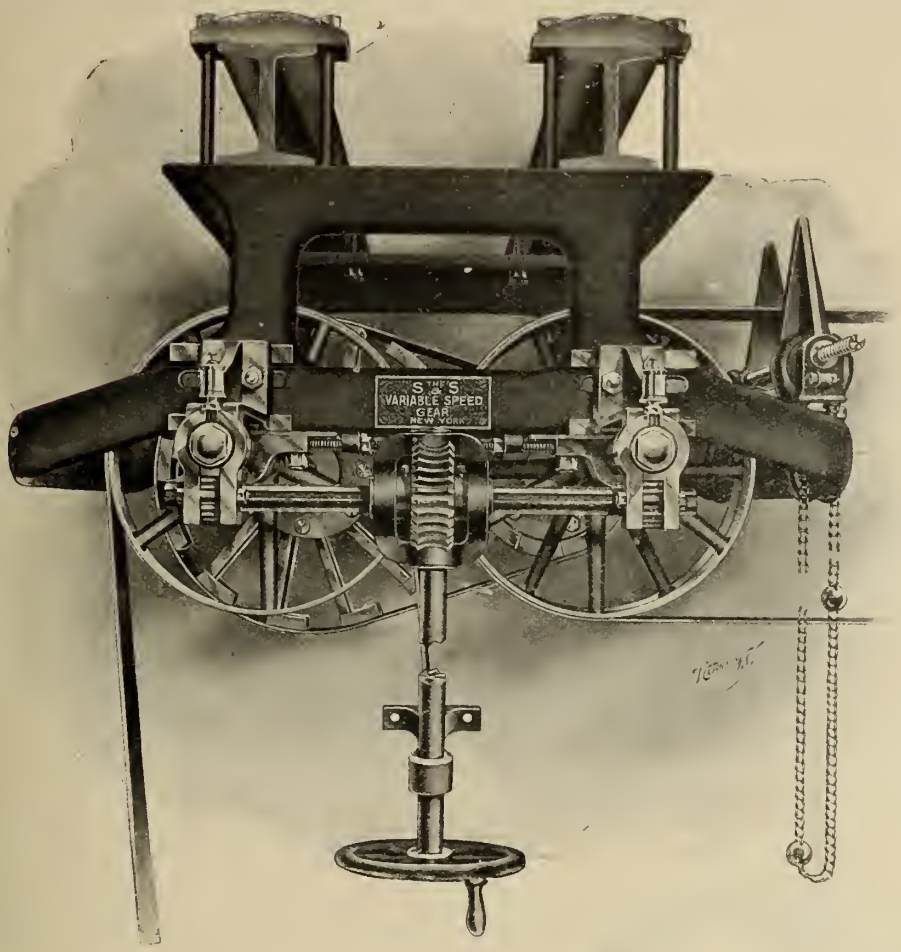

Fig. 1—End View of Variable Speed Countershaft.

The closed heater consists of a series of groups of tubes incased in an outer cylindrical shell, which serves as an enclosure for the exhaust steam that surrounds the tube. The tubes are arranged in groups so that the water passes six times the length of the tube through the exhaust steam in making its journey from water inlet to water outlet. The materials entering into the construction of the closed heater are principally heavy cast iron and brass, the shell, legs and caps being of cast iron and the tubes of straight, seamless drawn brass. These brass tubes have been found to effect a ready transmission of heat from the exhaust steam to the water. These feed water heaters and purifiers are made in sizes ranging from 50 h.p. to 4,000 h.p. An interesting catalogue describing these has just been issued by the Loew Mfg. Co., Cleveland, Ohio, who will supply anyone with a copy on application.

VARIABLE SPEED GEAR.

A VARIABLE speed gear of the expanding pulley type is shown in the accompanying illustration as manufactured by the S. & S. Engineering Co., of Brooklyn, N.Y., who have opened up a Canadian branch at 255 Jackson street west, Hamilton, Ont.

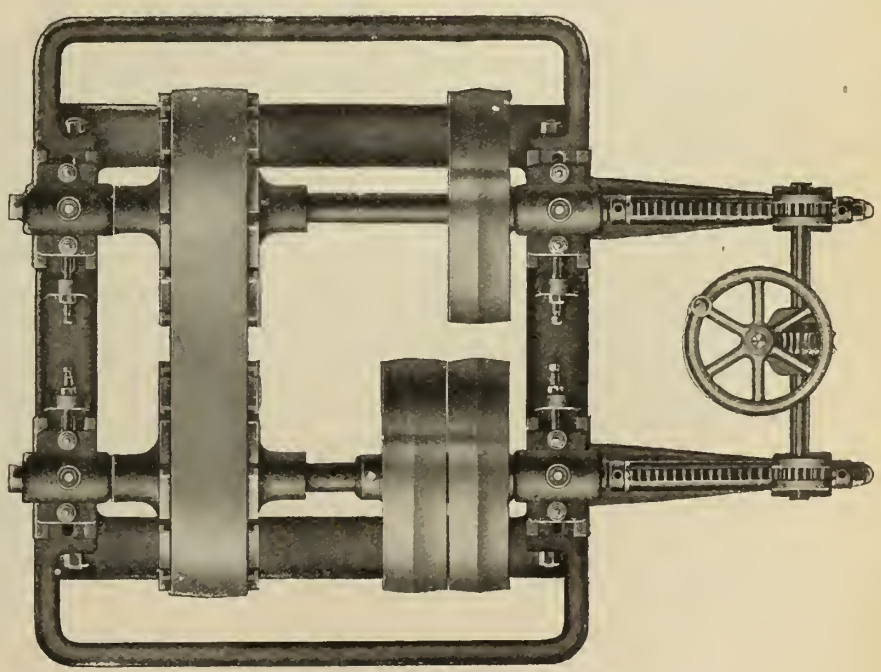

Fig. 2—View from Underneath.

Fig. 1 shows an end view of the variable speed countershaft and Fig. 2 a view from underneath. This variable speed gear lately perfected will transmit any amount of power, and vary the speed at the ratio of approximately 4 to 1. Each size takes up a minimum amount of space consistent with the amount of power handled. The handle wheel shown may be placed in a position most suitable for operators' requirements.

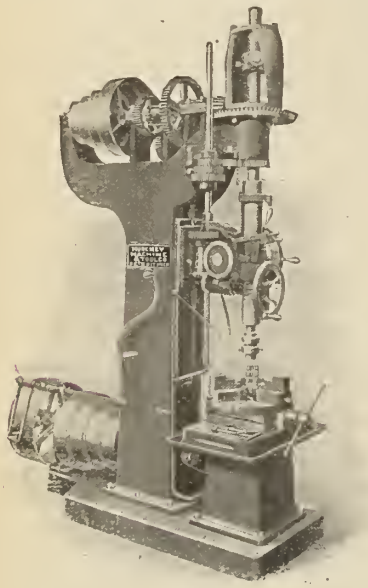
The variation of speed is effected by means of two solidly constructed expansion pulleys, belted together, each of which is capable of nearly doubling itself in diameter. The diameters of these pulleys altering simultaneously give the required change of speed, as the diameter of one increases, the other decreases. The expansion or contraction of each pulley is brought about in the following manner: Referring to detailed view of the shaft on opposite page, it will be seen that the hub of this expanding pulley is composed of cast iron disks or plates and that when all are assembled and bolted together the hub is of large diameter. The pairs of spokes riveted to each rim section are staggered and slide in corresponding slots, machined in these said plates. The spokes have teeth cut on their edges for part of their length which mesh with a broad pinion which is revolved by the insertion or withdrawal of an inner shaft with helical key ways cut in it. This inner shaft is prevented from turning within the tubular shaft by two oppositely placed keys, which not only serve to key fast pulley to tubular shaft, but project through same and fit into the straight grooves of the inner shaft.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

NEW FORM OF TAPPING MACHINE.

The tapping machine shown in the accompanying illustration has been designed by the Murchey Machine & Tool



Murchey Tapping Machine.

Co., Detroit, for the rapid production of steam and gas pipe fittings, as well as for special work.

Its characteristics are simplicity, strength, convenience in handling and great power.

Some of the more important points possessed by this machine may be enumerated as follows: A patented, frictionless head, which is of very great importance to the successful work of a tapping machine, easy travel of the spindle and large saving of taps and power. The machine shown in the cut has a table with a lateral and transverse movement which quickly and easily centers the work to the cored hole, another point of great importance in a tapping machine. The machine is arranged to use automatic collapsing taps with an adjustable stop, arranged to come in contact with a sliding collar which expands the chasers on the upward travel of the spindle. This is counterbalanced, and when the tap automatically collapses, it is quickly withdrawn, and is again ready for use. This avoids the necessity of reversing or stopping the machine, and effects a saving in labor of about 50 per cent. The machine being equipped with a pair of 4 x 16 clutch pulleys, permits of the machine being used either for solid taps or right and left hand threads. The machine is furnished, if desired, with a lead screw, which is arranged to feed any pitch of thread to suit requirements, or it can be fitted with a lever feed, hand worm feed or power feed and automatic stop, according to requirements.

Any kind of table may be furnished with the machine to meet the requirements of the work.

The principal dimensions of the machine with a range of ½ to 5 inches, inclusive, are shown in the following: Spindle, diameter, 2 ½ inches; Hole in spindle, 27-16 diameter by 4 inches deep; Centre of spindle to column, 14 inches; Size of table, 14 by 22 inches; Height of table from floor, 26 inches; Total height from floor, 7 ft. 8 inches; Floor space required, 2 ft. by 5 ft.

This machine can be furnished with special chucks for gripping flanges, or fittings, and can also be built in sizes to take up to 12 inch pipe.

WIRE NAIL MACHINES.

ILLUSTRATIONS are given herewith showing features of the National wire nail machines manufactured by the National Machinery Co., Tiffin, Ohio. One of the special features of these machines is the high speed at which they operate. The movements are such that even at their highest speed there is a minimum of jarring or racking. The cutting-off dies are carried in heavy cast steel arms that rock or oscillate on a shaft, as seen in figure 2, and as the motion is transmitted from cranks on the main shaft by pitmans the result is a very smooth action, the effect of the pitmans being to reverse the direction of movement of the cut-off dies without any jar.

The movement resembles that of a shear, resulting in better points on the nails and longer life to the cutting dies than is possible in machines having sliding cutters moving on parallel lines. The power is applied to the shear arms in line with the cutting strains, distributing the pressure on the bearings perfectly and minimizing wear. The

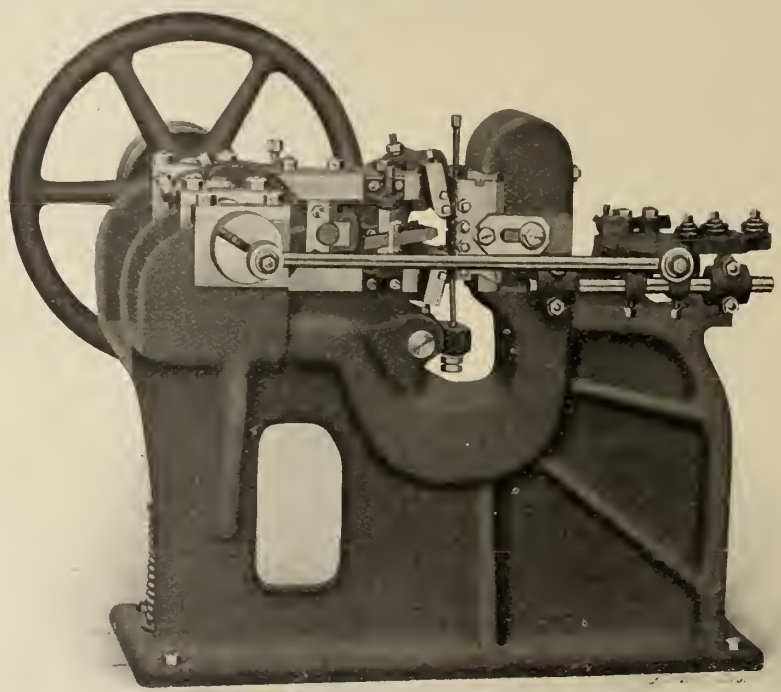


FIG. 1—National Wire Nail Machine.

heading tool is carried in a substantial cross head that is also driven by a pitman from crank in the main shaft. Provision is made everywhere for easily compensating for wear; all bearings may be kept snug, thus permitting the setting of dies to just the right position, i.e., so that their wear will result principally from contact with the wire and not from striking against each other.

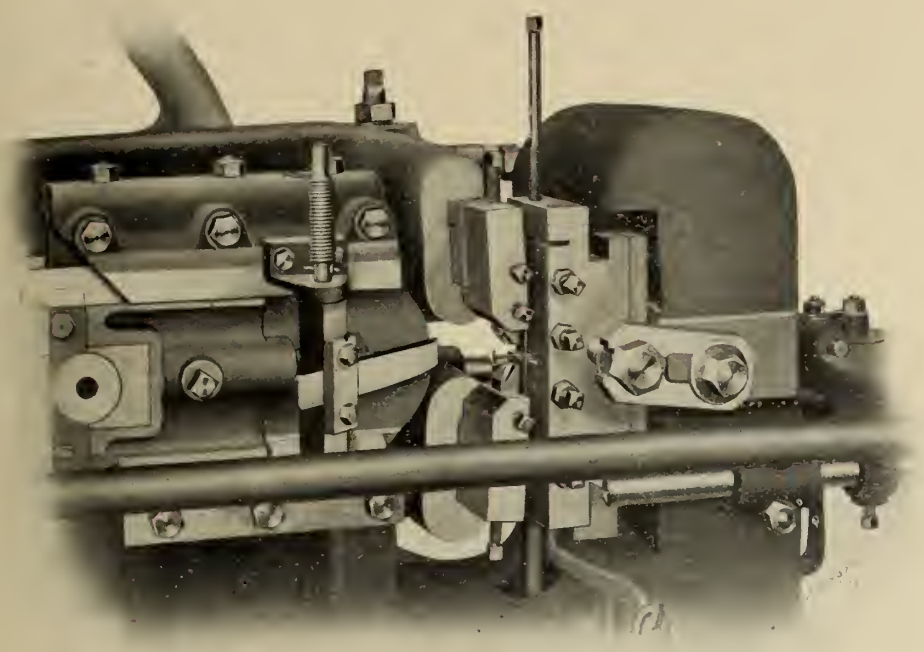

FIG. 2—Die Mechanism of Wire Nail Machine.

The cut-off dies are held in substantial holders that may be removed bodily from the machine, thus permitting the dies being readily replaced. Adjustments in two directions are provided for the lower die and in three directions for the upper one. The lower die holder has a screw device by means of which it may be sensitively adjusted in either direction horizontally at right angles to the wire; the upper holder has this also, and in addition a rack-and-pinion-actuated wedge device that provides a sensitive adjustment laterally with the wire. The grip dies are held in a box provided with screw controlled taper gibs. This box may be quickly removed for changing dies. It is adjustable laterally and horizontally by screw devices; it is backed by a taper wedge which is moved in either direction by a screw, and permits gauging the amount of stock for the nail's head to a nicety. All adjusting screws are hardened steel.

"AMERICAN" VARIABLE SPEED PLANERS.

THE necessity for "reduction in shop cost" having advanced to such a degree of late and the requirements of machine tools to meet these conditions, has led The American Tool Works Company, Cincinnati, Ohio, U.S.A., to develop a line of variable speed planers. In reducing planing costs to a minimum, the up-to-date works manager often requires variable cutting speeds to cover different classes of work in hand. The "American" variable speed planers are built to suit all these requirements. They build two types of variable speed planers; one with four (4) cutting cutting speeds, and the other with two (2) cutting speeds, each type having a constant speed return of the platen which is greatly in excess of its respective highest cutting speed. A description of these two types is given below.

These speeds are obtained through a speed box, in the designing of which the aim has been, efficiency, simplicity, and durability. The four (4) speeds are taken from a carefully chosen range, calculated to cover all requirements of modern planer work. These, with the constant high-speed return of the platen, insure the greatest working economy. The speed box is securely bolted to the top of housings, these being of special design and very substantial. It is symetrical in appearance and being completely closed insures the greatest economy of oil consumption and absolute freedom from flying oil. All shafts in the speed box run in long bronze bushed bearings perfectly lubricated by the "ring" or "dynamo" system of oiling. Frictions have been omitted, thereby eliminating trappy construction and slippage, thus increasing the pulling power of the planer. The gears run in oil, thus giving the longest life and least noise to these parts. They are of ample proportions, wide face and course pitch. The pinions are all steel and cut intregal with their shafts. Gears and pinions are cut with special cutters, incuring the greatest accuracy, longest life and minimum noise. Any of the four (4) speeds may be obtained by the simple manipulation of two convenient levers. A safety locking device prevents the engaging of two conflicting speeds at the same time. Index plate shows clearly how to obtain the desired speed.

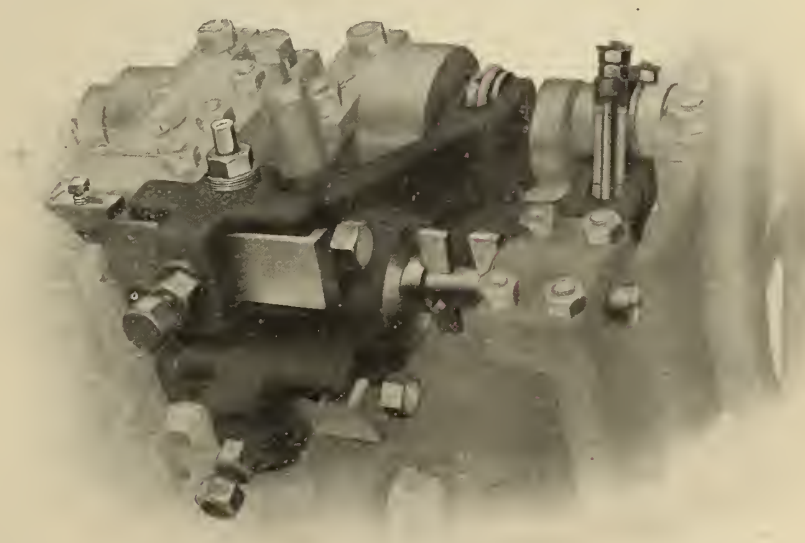

FIG. 3 - Cut Lever Construction of Wire Nail Machine.

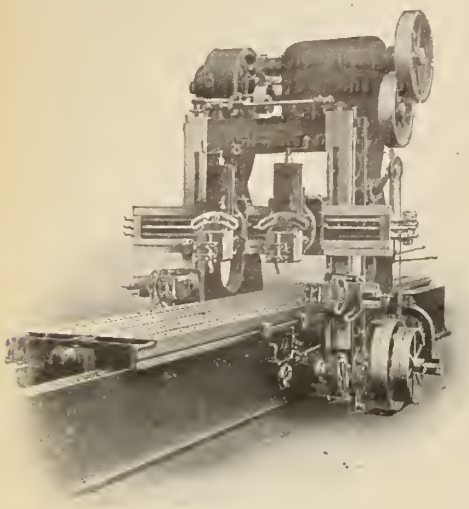
The driving pulleys have fly-wheel rims, the momentum of which reduces to a minimum all shocks to the driving mechanism due to intermittent cutting and at reversing also insuring a steady



Variable Speed Planer.

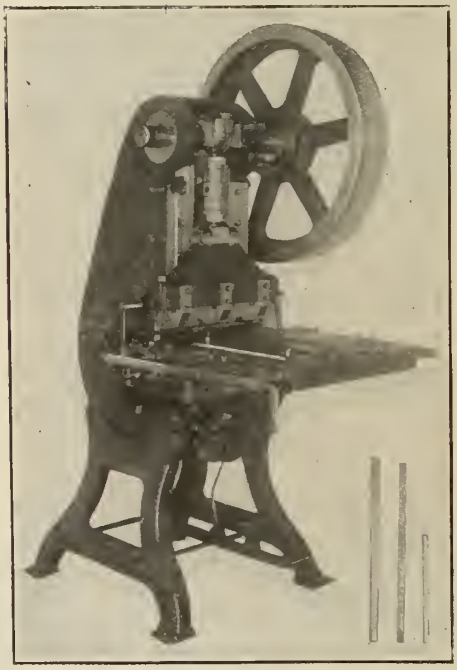
even pull at the cutting tool. They are perfectly balanced, running without the least vibration even on the highest speeds. This, coupled with a scientifically designed and accurately built planer in all its details, results in a finished job of planing so smooth and perfect that it requires the least, if any, attention from the vise hand in fitting. Belt or electric motor drive may be furnished, the latter being shown above. When motor driven, should the motor become disabled, the driving pinion on outside of speed box may be replaced by a pulley and the planer driven by belt from a countershaft, or another motor conveniently placed. The flexibility of this construction insures the constant use of the machine at all times. When belt driven, the planer may be readily converted into motor-driven at any time after installation.

POWER PRESS WITH SPECIAL FEED.

HARDLY any industry having employed a hand fed power press for producing all or part of its output that has not considered the attaching of some automatic device which would not only increase the production but also remove the possibility of danger to the operator. This fact is perhaps nowhere more apparent than in the machine illustrated, which has only recently been designed for automatically cutting hack saw blades from 8 inches to 20 inches long, made out of regular saw blade steel approximately 1-16-inch thick.

Formerly two distinct methods have been employed for this work. The first was to cut the strips in a gang slitter. This was found to be unsatisfactory because the slitting operation would so twist and distort the strips that it was with difficulty they were straightened. Then a plain power press with a shearing die and an adjustable back gange was used. The sheet was fed by hand against this gange, and at each stroke of the press a piece was cut off of proper width. This method answered fairly well, but the output was not sufficiently large. Then, again, there existed a certain amount of danger to the operator as he came toward the end of the sheet he was cutting.

To overcome all of these difficulties the E. W. Bliss Co., 20 Adams street, Brooklyn, N.Y. has built the machine already mentioned. It is automatic in its action and operates as follows: The



Power Press with Special Feed.

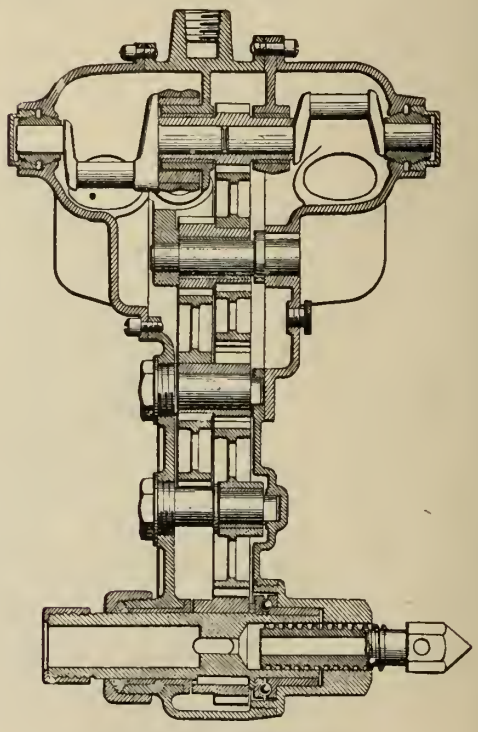
sheet which is to be cut into strips is clamped in the carrier on the feed table. Depressing the treadle causes the slide to descend, operating a set of pawls, which, in connection with a rack device, advances the sheet uniformly at stated intervals until it has been cut entirely into strips. The feed can be adjusted to advance the sheet at ¼-inch to 1-inch at each stroke, varying by sixteenths. After the sheet has been cut up the hand lever at the side is raised to release the pawls and the carrier is pulled back into position by hand. The sheet is held down by a very heavy spring clamp, which securely holds it during the cutting. The feed table is 20 inches square.

THE LITTLE GIANT CORNER DRILL.

THE Chicago Pneumatic Tool Co. have just placed on the market a new "Little Giant" drill for corner work. From past experience in air tool practice, the firm hold that this new drill surpasses any other drill yet devised for drilling in close quarters and in corners particularly; the machine having been designed especially for work in the latter class. Parts for No. 4 Little Giant drill interchange with the new drill mentioned, thus insuring quick repairs.

This new tool weighs but 35 lbs.; capacity 1½-inch (but in emergency cases will drive 2-inch twist drills with very satisfactory results); spindle speed when running light, 150 R.P.M.; under load with 80 lbs. air pressure, 100 R.P.M.; distance from end of socket to end of feed screw when run down, 5⅞-inches; length of feed, 2 inches; distance from centre of spindle to outside of housing, 1 5-16 inches.

In addition to the fact that it is the most powerful drill ever devised, weight considered, it possesses advantages over other designs of corner drills, owing to the spindle being driven by gears instead of ratchet principle, which insures steady and constant spindle movement.



Little Giant Corner Drill.

The accompanying illustration gives a very clear idea as to the general design which it will be noted is neat and compact.

Industrial Progress

CANADIAN MCHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc All such correspondence will be treated as confidential when desired

Civil Engineers' Convention.

The twenty-first annual meeting of the Canadian Society of Civil Engineers is being held in Montreal on Jan. 29th, 30th and 31st. The Tuesday meeting will include the nomination of scrutineers, election of officers and the address of the retiring president, H. M. Lumsden.

On Wednesday the members are invited to visit the works of the Canada Car Company at Turcot, the works of the Simplex Railway Appliance Company at Rockfield, and the Canadian Rubber Company's works at Notre Dame Street east.

By the courtesy of the Montreal Street Railway, cars will be in waiting at the Windsor Hotel, and will leave at 9.30 a.m. sharp for Rockfield, The members will be the guests of the Canada Car Company at luncheon. In the evening there will be the annual dinner in the Windsor Hotel.

On Thursday there will be a meeting for the reception of reports of scrutineers and concluding the business of the annual meeting, and also a meeting of the newly-elected council.

Another Canadian Industry.

The latest manufacturing firm in the United States to establish a plant in Canada is the Gilson Mfg. Co., of Port Washington, Wis., who are now building a plant at Guelph, Ont., for the manufacture of gasoline engines. Although there are many manufacturers of gasoline engines in this country there is plenty of room for the establishment of a plant as is now under way for the Gilson Mfg. Co. This firm make a specialty of a 1 h.p. air cooled engine that has come in for considerable attention, having been eminently successful wherever being installed and operated whether of this size or other sizes manufactured by the company.

Power Equipment Wanted.

The Alvinston Power Co., of Alvinston, Ont., are in the market for new engines and dynamos for their plant in that town. The manager is H.R. Carruthers, who will be glad to receive quotations from various manufacturers.

Brandon, Man., is giving a thirty year contract to a United States firm, the National Lighting & Heating Co., to supply gas to the city. They will erect a gas plant at a cost of $100,000.

Enlarging Their Business.

Hutchison Bros., expert electricians and machinists, of Victoria, B.C., have recently enlarged their business and propose erecting fully equipped plant on most modern lines. They will manufacture special machinery and conduct business of general engineering work, manufacturing gas and oil engines of their own design. Automobile shops will also be run in connection with the works. The officers of the newly reorganized company are President, W. G. Winterburn ; Vice-President, R. H. Hutchison ; and Managing Director, D. C. Hutchison.

Machine Shops for Vancouver.

The British Columbia Marine Railway Co. is being enlarged during the present year by the addition of a large machine shop similar to those now in existence in the company's yards at Esquimalt, where 300 men are employed. A very large amount of new machinery will be required for this installation.

Important New Industry.

Since the incorporation of the Canadian Billings & Spencer Co. as a Canadian branch of the Billings & Spencer Co., of Hartford, Conn., with a capital of $200,000, an investigation of the suitability of the various towns has been made by the manager, Mr. J. Gill Gardner, of Brockville. Up to the present no decision has been reached, but as soon as satisfactory arrangements have been made work will commence at once on a modern and first-class plant to manufacture drop forgings and drop forging machinery, making a specialty of auto and bicycle parts. The Billings & Spencer Co. are one of the oldest and largest firms making drop forgings in the United States. They manufacture a large per cent. of the forgings for the United States Ordnance Department.

Change Due to Fire.

The Dodge Manufacturing Co's. Montreal branch premises at 419 St. James St., were recently damaged by fire. The Dodge Co., however, promptly secured temporary premises at 364 to 368 St. James St. Full and complete stocks of the company's lines in power transmission machinery were at once shipped from the works at Toronto, thus enabling business to proceed as usual. The Dodge Manufacturing Co. are Canada's largest pulley manufacturers, and their facilities and resources were evidenced in the prompt manner in which the stock was replenished.

Railway Progress for 1907.

During the coming year railway building in Canada will be carried forward on a still greater scale. It is proposed to build 3,314 miles of railway, the amount expended by the various companies as follows : Canadian Pacific, $23,000,000 ; Canadian Northern, $15,000,000 ; Grand Trunk, $5,000,000 ; Grand Trunk Pacific, $7,000,000 : Great Northern, $10,000,000 ; and Temiskaming and Northern Ontario, $2,000,000. The Grand Trunk Pacific is not the only big work under way. The C. P. R. is staking out a line along the shores of Lake Ontario, passing through Bowmanville, Oshawa and Whitby. The Canadian Northern has surveyed a line that runs somewhat north of the G.T.R. and projected C.P.R. lines, and application has just been made at Ottawa for a Canadian Northern line from Toronto to Windsor. It is reported that next year the G.T.R. will jump into the important job of double-tracking its line from Toronto to North Bay, while strong arguments will be advanced to the Ontario Government to extend the Temiskaming line to Toronto. All these proposals are for tracks to cover long distances, and anyone of these undertakings would have caused a sensation ten years ago. To-day we treat them as matters of course. The Temiskaming line will be extended to form a junction with the Grand Trunk Pacific.

Large Power Available.

At the Empire Club luncheon held in Toronto on Dec. 27th, Mr. Cecil B. Smith gave a talk on Niagara and hydro-electric power. He instanced that the investigations of the Power Commission showed that from five to six million h.p. may be available to the people of the province of Ontario even during the dry weather season.

Reviewing some of the work done in developing water powers in other countries, he instanced Italy, where the Government was spending forty million dollars in electrical development enterprises, In France and Switzerland similar Government enterprises were being undertaken. In California electrical power was now being transmitted 250 miles. Canada, he said, was particularly fortunate in regard to immense water powers suitable for permanent power development.

Interesting Legal Case.

Mr. Justice Britton decided rather an interesting case on January 11th in the Assize Court, in that of Scott v. Barchard. W. H. Barchard & Son, Toronto, were the defendants in an action for $2,500 damages for injuries sustained to the thumb of the right hand of Richard Scott, a machinist. The main point urged by plaintiff's counsel was that the circular saw at which he was working was unprotected by a guard, as is the case in most mills, and several machinists from various box factories gave evidence to the effect that they had never been in one where guards were not used on the saws. Mr. W. H. Barchard in the witness box stated that he had never heard of guards being used, and had never seen one similar to the model shown in court. In answer to a question of counsel for the plaintiff, he said that he took no trade journals whatever. In reply to the judge's questions, the jury brought in a finding as follows : "Did the accident happen by reason of the absence of a guard on defendant's rip saw, at which the plaintiff was working ?" "No." "If so, were the defendants negligent in not having that saw securely guarded ?"

"No." "Could the plaintiff, by the exercise of reasonable care, have avoided the accident?" "Yes." "What damages?" "None." "If the defendant could have avoided the accident what could he have done?" "Kept the table-top clear of lumber on the left side of the saw."

New Car Construction Plant.

The unprecedented railway development now going on in Canada is attracting the attention of outside capitalists, and the exceptional advantages of the suburbs of Montreal prove most alluring to them.

It is said that what will be the largest car construction plant in Canada is shortly to be erected near Montreal West. The new works are to have a capacity of turning out from 50 to 60 cars per day.

The estimated cost is five million dollars. In addition to the car shops proper, there will be a forge shop, axle, truck and bolster shop, and wheel and casting foundry.

The formalities of organizing the company have not yet been attended to, and even the name is yet to be decided upon, but operations will be started at once, and it is promised that the works will be turning out cars early in the coming autumn.

New Machine Shop.

The Polson Iron Works, in order to keep pace with the industrial growth of Canada, are again planning large additions to their works. One of these additions will be a new machine shop 80 x 350 feet, south of the office buildings, the foundations for walls and machine tools being already laid. The new shop will have a 20-ft. gallery on either side, for the lighter class of work, with two 40-ft. electric travelling cranes, and will be equipped with the best tools on the market. The present machine shop will be added to the boiler shop.

Tenders for Grand Trunk Pacific.

The second call for tenders to undertake the transcontinental railway construction was gazetted in Ottawa. on January 5th. Contractors will be given until Feb. 14th to tender on the five new sections of the line. These are from Grand Falls, N.B. to the Quebec boundary, about 62 miles. From the Quebec boundary to Quebec Bridge, about 150 miles. Fom La Tuque, Que. west to Weymontachene, about 45 miles, and from a point about 8 miles west of the Abitibi River east for 150 miles.

Power Pointers.

In his speech in Toronto regarding the power by-law not then passed, Hon. Adam Beck brought out the following points:

The commission's estimate of $17.50 per h.p. as the maximum cost of power delivered in Toronto is absolutely reliable. Probably that figure is too high.

On Toronto's present consumption of power a saving of at least $500,000 per year can be made. With the increased amount of power used, if the price of power were lowered, this saving will be immensely greater.

Every citizen will benefit, and not the manufacturers alone.

An immense impetus will be given to industrial development in Toronto.

The enterprise will be from the first on a self-supporting basis. The users of power or light will bear all the expense.

After the signing of the contract power can be supplied to consumers within eighteen months.

The contract can be for a term varying from ten to forty years, at the option of the city.

There will be no danger of an interrupted service, and an auxiliary steam plant to meet emergencies will not be necessary.

The enthusiastic manner in which the citizens of Toronto voted in favor of the by-law will give Mr. Beck and his colleagues a chance to demonstrate what can actually be done along this line.

Engineers' Club Dinner.

The annual dinner of the Engineers' Club of Toronto, was held on Jan. 3rd, at their club rooms, 96 King St. West, being attended by some 75 members. A toast to "Our Country" was proposed by Mr. F. L. Somerville, president of the club, being responded to by Dr. Galbraith of the School of Practical Science. T. H. White, chief engineer of the Canadian Northern Railway, who also responded, declared that he had seen every portion of Canada from ocean to ocean and his pride in the country increased with his knowledge of it. A toast to the "City of Toronto" was responded to by C. A. Goade, who stated that if the plans were carried out Toronto would undoubtedly become the most beautiful in Canada. A toast to the "Sister Societies" was responded to by Cecil B. Smith, representing the Canadian Society of Civil Engineers, and Mr. Dillon-Mills, representing the Canadian Institute, and Mr. McKenzie representing the Student Society of S.P.S.

Owen Sound Activity.

The metal working interests of Owen Sound are unusually busy at the present time, although the present season is considered the slackest of the year. The Owen Sound Iron Works, who are making a specialty of pumps and cement working machinery, have a large number of contracts on hand to supply various cement plants throughout the country with new machinery. These include two wet grinding tube mills, two large duplex slurry pumps, besides shafting pulleys, etc., for the Owen Sound Portland Cement Co. Three duplex steel frame pumps, one single acting slurry pump, three feed pumps, rotary coal dryer vertical cooler, coal stock hoppers, raw stock hoppers, two steel smoke stacks, 84′ high and thousand h.p. feed water heater for the Colonial Cement Co., of Wiarton. Other apparatus on hand include orders from the Sun Portland Cement Co., the Imperial Cement Co., Raven Lakes Portland Cement Co.

At the works of William Kennedy & Sons the plant is working in full time. One of the large undertakings includes ten horizontal water wheels, 49″ diameter for a 9′ head for the Corporation of Morrisburg. Eleven water wheels have just been turned out for the St. Raymond Paper Co., being installed at their plant at St. Raymond, Que. The work is at present under way for three water wheels for the Penman Mfg. Co. of Paris, Ont. The steel casting department is working to its utmost limit and plans are under way for large increase in casting.

The Canadian Scientific Apparatus Co. have established a plant at 929 Yonge St., Toronto, for the manufacture of dies and tools, together with instruments of precision, surgical instruments, electrical and special machinery.

Large Outlay for Machinery.

The Dey Concentrating Co., of New York, one of the largest concerns in the world, making a specialty of the treatment of graphite, have purchased twenty propertics in the Laurentian district between Labelle and Buckingham. The company has spent $500,000 in the equipment of machinery to be used in the development of these properties, which extend over 100 miles of territory. It is understood that the graphite flakes obtained from various points on the Labelle line are the largest and best in the market for the refining of precious metals, being absolutely free from any of the impurities what cause defects in the crucibles.

Frost and Wood Fully Equipped.

Since suffering the loss of almost their entire plant a year ago the Frost & Wood Co., of Smith Falls, have built one of the most up-to-date manufacturing establishments in the country. It has been modelled along the most modern plans and will enable this company to turn out their work with greater economy and increased perfection.

In the new machinery electricity plays a prominent part, it having been decided to run the entire works by electrical energy, the machine tools being run from individual and group driving purchased from the shops of the Canadian Westinghouse Co., including one 230 K. W. 440 volts, revolving field engine, type A. C., generator complete; one 140 K. W. 140 volts revolving field engine, type A. C., generator complete; one 6 K. W. belt-driven 125 volts exciter generator; one 10 K. W. belt-driven 125 volts exciter generator; one switchboard, blue Vermont marble, 5 panels; two 75 horsepower induction motors; two 40-horsepower induction motors; three 30-horsepower induction motors; four 20-horsepower induction motors; three 20-horsepower induction motors; three 10-horsepower induction motors, and four 7½-horsepower induction motors, and in addition to this the very latest methods have been adopted throughout the plant, and it is expected that this firm will go ahead at a faster rate than ever.

New Industry for New Glasgow.

Another new industry is to be started in New Glasgow for the manufacture of steel castings. A company with a capital of $200,000 has secured a site near the steel works and will at once commence the erection of suitable buildings.

Will Enlarge Works.

E. Leonard & Sons, London, have taken out a building permit for an addition to the machine shop, on York St., between Colborne and Waterloo. The addition will be 54 by 60 feet.

London defeated the waterworks by-law.

Bolton will raise $2,500 for cement walks.

The new Normal School at Hamilton will cost $50,000.

Thorold carried a waterworks by-law by a majority of 12.

The Welland Electric Street Railway Company is applying for a charter at Welland, Ont.

A project is on foot to establish a large railway car building plant in St. John, N.B.

The Mickle Dyment Lumber Company will erect a new factory in Brantford at the cost of $10,000.

The building returns of Calgary and suburbs, for the year 1906, will be in the vicinity of $3,000,000.

A new cement roundhouse has just been completed at Brantford for the C.P.R. at the cost of $8,000.

A lime industry is spoken of for Port Arthur, and a location is being looked for on which to start the plant.

The DuBois Iron Works, of DuBois, Pa., have taken over the entire business of the Lazier Engine Co., of Buffalo, N.Y.

The Woodstock Electric Light Company have been given the contract for electric lighting at Woodstock, N.B.

An application has been made to the Council of Brandon for a franchise to install a gaslight and power plant in that city.

The building permits issued in Vancouver for 1906, total $4,084,840, which is more than double those of two years ago.

J. I. Case Co., the large American threshing machinery manufacturers, will establish Canadian headquarters at Regina.

The Shipway Iron, Bell and Wire Company, of Toronto, are considering the moving of their plant to Niagara Falls.

The Waterous Engine Works, of Brantford, have taken out a building permit for a $4,000 addition to their main building.

The Imperial Coal Company, of Beersville, N.B., are planning to establish a brick-making plant with a capacity of 20,000 per day.

The blast furnace plant of the Atikokan Iron Company in Port Arthur, under construction all summer, is now almost complete.

The Board of Trade of Raymond, Alta., have appointed a committee to look into the question of installing an electric light plant.

The Canadian General Electric Company are installing an electric plant at Dorchester, N.B., for street and commercial lighting.

The Winton Automobile Company will establish a branch factory in Toronto. It is also intended to establish factories in England.

The Canada Screw Company will begin extensive building operations in the spring, doubling the capacity of their plant in Hamilton.

The Phillips Manufacturing Company of Toronto have plans out for a large factory, which will be erected for them in the spring.

F. C. Filer, of the Northern Electric & Manufacturing Company, of Montreal, is establishing a branch of his company in Winnipeg.

A large saw mill will be erected by the Graham Island Lumber Company, at Massett Harbor, B.C., with a cutting capacity of 250,000 feet daily.

The B. F. Graham Lumber Company has purchased the Taylor, Pattison Mill on Victoria Arm. The price paid was in the neighborhood of $50,000.

Over one hundred thousand dollars has been subscribed by Sydney, N.S., citizens for stock in the new railway construction plant, in that city.

The Stanley Smelting Company, of Maine, have received a license to manufacture iron, steel, maganese, coke, copper, lumber, etc., in Ontario.

The Miller Reversible Gasoline Engine Co., of Toronto, have removed from their quarters at 39 Sherbourne street to 569 Yonge street, of the same city.

Owing to the scarcity of brick the new telephone building at Edmonton is to be of concrete up to the street level, and of cement blocks above that.

Great interest is being manifested in the iron resources of the Port Arthur district, a great number of prospectors being out for American capitalists.

The Massey-Harris Company, Toronto, have taken out a permit for a small addition to their building. The Toronto Carpet Company will also enlarge.

The city of Winnipeg is making additions to its power plant which will necessitate buying more boilers and electric generators, together with auxiliary apparatus.

The Hamilton Steel & Iron Co. have just installed two duplex outside pack plunger pumps with pot valves, the output of the plant of the Smart-Turner Machine Co.

The sum of $600,000 has been subscribed in Quebec for the starting of a cement industry. The land has been purchased, and works will be started immediately.

The plants of the Tilson Manufacturing Company and the Standard Fitting and Valve Company, of Guelph, will be rapidly pushed to completion in the early Spring.

The contract for erecting the Meisel Manufacturing Company's new plant at Port Arthur has been awarded and work will be commenced on the buildings at once.

The Canadian Northern Railway has purchased about 110 acres of land on the Don flats, Toronto, to be used for roundhouses, car sheds, repair shops, cold storage plant and other requirements of the railway.

A large metal manufacturing company is negotiating to locate in Calgary. They offer to build a plant costing $100,000 and employ from sixty to seventy hands.

The Temiskaming & Northern Ontario Railway Commission is asking for tenders for the construction of general offices at North Bay, at the cost of $25,000 or $30,000.

The Majestic Wire Fencing Co., Detroit, Mich., will erect a factory at Victoria, B.C., for the manufacture of concrete reinforcements at a cost of about $40,000.

The Dominion Sewer Pipe Company have acquired property in Hamilton and will erect a factory, for the manufacture of sewer pipes, flue linings, gutter pipe and wall coping.

The Economic Power, Light and Heat Supply Co., York street, Toronto, have installed a 25 h.p. National Gas Engine in the Rossin House, Toronto, for electric lighting purposes.

Peterboro carried a by-law to provide $21,000 additional to the $40,000 already in the hands of the Board of Education to erect a new collegiate institute, costing $61,000.

Another industry has been located at Welland, by John A Reeb, of Port Colborne, and W. J. Sommervile of Welland, who will manufacture wood fibre wall plaster, and cement tile.

The Chapman Double Ball Bearing Co. recently ordered from the London Machine Tool Co., a 600 ton belt driven, drawing and stamping press—one of the most powerful machines used for this purpose.

The new works of the Plymouth Cordage Company, Welland, will be operated by electricity, the Cataract Power Company, of Hamilton, having secured a contract to supply 1,200 h.p.

The ratepayers of Wolfville, N.S., are considering the acquisition of the electric plant for both street and commercial lighting. If acquired, an all-night service will probably be adopted.

A group of Montreal merchant princes with a total capital of $20,000,000, propose to supply gas and electricity to the city of Montreal in competition with the existing Montreal Light, Heat & Power Co.

The pipe works of New Westminster, B.C., are rapidly nearing completion. The main building is 138 feet by 68 feet. It is expected that the company will be turning out pipe by the middle of next month.

The Commercial Cement Company, of Carman, Man., have started to instal their new machinery, and work will be pushed with all haste so as to have their plant in operation in the early spring.

The plant of the Goderich Engine and Bicycle Co. has been purchased by the Rogers Manufacturing Co., of Toronto. General foundry and railway specialty work will be done in the shops.

The Canadian General Electric Company, Peterboro, will shortly let con-

tracts for a two-storey addition, 250 feet long, to their plant. The new addition will be for the lamp and wire departments.

The Manitoba Iron Works, have under construction ten double drum, double cylinder, steam hoists. These are for use on the Transcontinental Railway contract, and are the first ever manufactured in Winnipeg.

The Grand Falls Power Co., St. John, N.B., have offered, if given the exclusive right of supplying the city with electric power for 30 years, to supply power at a much lower rate than at present exists in St. John.

The Dyment Foundry Company, of Barrie, have a few men working to complete some orders which were on hand at time of fire. When these are finished the men will be let go and the buildings closed up.

The citizens of Sydney have voted to grant a bonus of $50,000 to the new Rolling Mills Company. The company will begin building operations as soon as possible.

There were erected in Montreal during 1906, 1,484 new buildings, valued at $7,745,023, as compared with 1,145 valued at $4,779,380 for the previous year. Ten structures exceeded in estimated cost $100,000 each.

The Great Northern Railway has announced a new freight tariff, effective December 27, making voluntary reduction in rates from the south to Winnipeg, Portage la Prairie, Brandon, Prince Albert and Edmonton.

Large consignments of sisal have been landed at Halifax this season by the Mexican Liner Sokoto. It is estimated that one hundred carloads per month will be imported via Halifax for Ontario manufacturers of rope.

A scheme proposed by the London, England, County Council, in which it is prepared to serve an area of 151 miles with electrical energy at an enormous industrial and commercial gain, will involve the expenditure of $17,000,000.

New Liskeard, Ont., will invite tenders for the erection of a new bridge over the Wahbi River. It will be a steel span for a bridge seventy-five feet long, driveway twenty-two feet, and a walk on each side five feet wide.

Promoters from Harvey, Illinois, have been at Windsor looking over a site on which they may establish a big manufacturing plant if the United States Steel Company carries out its proposal to build near Sandwich.

The Dominion Pipeworks and the Patterson Boiler Works of New Westminster, B.C., are in course of construction, and work will be started, on two other important industries, the Crystal Glass Works, and the soap factory.

The Vulcan Machine & Tool Co. have recently opened a machine shop at 116 Adelaide St. W., Toronto, and although they have been in operation only a short time, they have secured many contracts and have been kept busy since starting.

The Standard Fuel Manufacturing Company of Fairview, Halifax, have decided to move their works to Amherst, N.S. The company manufactures a fire lighter composed of sawdust and a chemical mixture formed into briquettes.

New York capitalists are in communication with the municipal council of Goderich, with a view to building a $5,000,000 steel plant. The concern would employ fifteen hundred hands, and would occupy one hundred acres of land.

Power will be generated by next fall on the Aroostook Falls in New Brunswick. Already the tunnel is well under way and a lot of heavy machinery being set up. Besides selling power to New Brunswick it is proposed also to transmit some of it to Maine.

The contract for the locomotive shops at Moncton, N.B., for the Intercolonial Railway, to replace those recently burned, has been awarded to a Montreal firm, at a price of about half a million dollars, and will be built entirely of concrete and steel.

The International Acheson Graphite Company of Niagara Falls, N.Y., are now manufacturing a soft artificial graphite which may be used for electrotyping, lubrication and stove polish. A new discovery by E. G. Acheson has made this possible.

P. W. Sotham, engineer of the Hydro-Electric Power Commission, reported to the Board of Control in Toronto that the cost of commercial light will be 16 cts. per k.w. hr., and residential lighting 5 cts., while the Toronto Electric Light Co. charge 25 cts. per k. w. hr.

The Canadian White Company made a proposition to take over the street railway franchise at Edmonton, Alta., but it did not receive favorable consideration, as the council have in view the operation of an electric street railway as a municipal enterprise.

A tunnel crossing the English Channel is assured. The Channel Tunnel Co. has been formed, half of the work to be done by British capitalists and the other half by French capitalists at a cost of 16,000,000 pounds sterling. The total length of the tunnel will be about 22 miles.

The contract has been let for the building of the Berg, Sand, Lime and Brick Company, in Brantford. The buildings will consist of a two-storey main building 50 feet square, and another building 100 feet long. The new buildings, when completed, will cost $5,000.

The Taylor, Forbes Company's foundry at Guelph suffered $5,000 damage by fire on January 6th. The fire only temporarily stopped the work in the radiator foundry, about 100 men being out of employment for about two days. The loss was fully covered by insurance.

The largest and heaviest single block of granite ever sent from the United States into Canada has just been shipped to Montreal and will be fashioned into a memorial to be erected in honor of the late Hon. Raymond Prefontaine, Minister of Marine and Fisheries.

Hon. H. R. Emmerson, at a Liberal banquet in St. John, N.B., on December 28th, announced that Canada will spend over $62,000,000 on railways during the coming year. It means the incoming of thousands of workers, and the opening up of thousands of square miles of new territory.

The Economic Power, Light and Heat Supply Co., York street, Toronto, are installing a 90 h.p. Pintsch Suction Gas Producer plant and National Gas Engine at Christie-Brown's, Toronto. They are also putting in a 110 h.p. Pintsch Suction Producer at the new works of the Brantford Screw Co.

The National Car Co. will establish their works at Whitby. These works are to supply the needs of the proposed electric line of the Huron and Ontario Railway. The town will bonus the company to the extent of $2,000 yearly for 12 years, and the works will be exempt from municipal taxes.

The Barchard box factory on Duke Street, Toronto, was damaged by fire on January 11th, to the extent of about $1,500. The cause is said to have been an over-heated bearing, which ignited some saw-dust. All the belts and main driving shaft were destroyed, and the saw and printing machine damaged.

The Canada General Electric Company and the Canada Foundry Company who are just completing additions to their buildings at Peterboro and Toronto, are again required to enlarge to meet with the ever increasing demand for their products, which are largely used in construction work.

A new fire-clay lining for stoves has been invented by Mr. Werther, formerly superintendent of the open hearth furnaces of the Dominion Iron and Steel Company. The basis of the preparation is Sydney cement, and the cost of this improved lining will be no greater than that of the ordinary iron material.

A big deposit of high grade iron ore has been discovered near Desbarats, Ont., a few miles below the Soo. It is said to be as good as any in the Lake Superior country. It lies close to the water, and can be shipped to southern lake ports easily, making a much shorter haul than from Lake Superior.

The Bell Telephone Company have contracted for 83,000 poles for delivery next year for the extension of telephone lines in Canada. This represents 2,500 miles of construction. The rural telephone service of the province of Manitoba will be doubled in extent. There are some 2,000 farmers connected at present.

The Ontario Iron and Steel Company's plant, which has been under construction for some months at Welland, will be a much larger industry than was expected. The plans now are for an expenditure of $300,000, and the works will employ about five hundred men. It is expected they will be completed by June 1st.

The Munro Wire Works, in Winnipeg, have extended their plant to meet with the increased business. This new building cost about $30,000, and is set apart for the production of all kinds of wire mattresses and the handling of iron beds. The Northwestern Brass Co. are erecting a steel building, 80x100 feet, at the cost of $40,000.

The Safety Explosives Company has been incorporated with a share capital stock of $300,000 for the purpose of manufacturing explosives and chemicals of every nature. The head office will be at Montreal, Que., the directors being W. H. Evans, R. W. Withycomb, W. A. Wier, W. J. Wright and A. W. C. Macalister of Montreal.

Duplex boiler feed pumps have been supplied within the past month by Smart-Turner Machine Co., of Hamilton, to T. W. Sims, Little Current, Ont., the Nova Scotia Fertilizer Co., Halifax, N.S., the Canada Steel Goods Co., Hamilton, the McLachlan Carriage Co., of Oshawa, E. E. Stevens, Halifax, N.S., the Metropolitan Oil & Soap Co., Toronto.

The Producers Torpedo Company has been incorporated with a share capital of $15,000, for the purpose of manufacturing nitro-glycerine, dynamite and other high explosives. The head office will be at Leamington, the provisional directors being G. W. Benson, E. Wigle and E. Winter, of Leamington, and Wm. Fleming, of Kingsville.

Nine new industries have been located in Toronto during 1906. These are the Kindall Bed and Mattress Co., St. Louis; Blanchite Process Paint Co., New York; Canada Bolt and Nut Co., Boston; De Sauga Silk Co., St. Etienne, France; Chemical Laboratories; Dominion Carriage Works, Berlin Electrical Manufacturing Company.

A pair of 42″ Canadian turbines have just been installed in the plant of the Collins Inlet Lumber Co. to drive a gang of saw mills and run a box factory. These turbines working under a head of 36′ give 318 h.p. were installed by C. Barber & Sons, Meaford, who are also installing another pair of 36″ horizontal turbines for the Delhi Light & Power Co.

The city of Montreal is interesting itself in the water power of the Beauharnois canal, and recently a deputation from the city interviewed Sir Wilfrid Laurier on the subject. Sir Wilfrid expressed the opinion that if the power were leased to any private company the latter would first have to guarantee to furnish Montreal, Beauharnois and Valleyfield with whatever power they require at market prices.

The Sydney Cement Company have decided to enlarge their plant, which is situated on ground leased by them from the Dominion Iron & Steel Company, between two railroads, a position of considerable advantage for deliveries of raw material and for shipment of its products. The cement is made from slag which is procured from the blast furnaces of the Dominion Iron & Steel Company.

A million and a half will be spent by the Montreal Light, Heat & Power Co. on the Soulanges Canal for development. It is expected to have this completed by the early fall, whereby 1,500 h.p. will be added to the electric capacity of the company. The contract for the dam and canal work is to be executed by the Canadian White Co. The Dominion Bridge Co. are building the steel gates, Allis-Chalmers-Bullock the hydraulic machinery and water wheels, and the Canadian Westinghouse the electrical machinery.

The Hamilton and Fort William Navigation Company of Hamilton, have placed an order with the Canadian Shipbuilding Company for an 8,500-ton freight steamer, to be built for the iron ore, coal, and wheat trade. This steamer, which will be one of the largest on the lakes, will be built at the shipbuilding company's Port Colborne shipyard. The machinery will be built in Toronto.

A charter has been granted by the Manitoba Government to the Manitoba Rolling Mills Company, with a capital of $100,000, to take over and operate the Kirkwood Iron & Steel Rolling Mills, of Winnipeg. These mills were built by T. M. Kirkwood, Toronto, who has lately associated with him the president and officers of the United States Horseshoe Company, of Erie, Pa., Mr. Kirkwood will be the vice-president of the company.

Welland, Ont., Town Council, have given the contract for street lighting to the Stark Electric System, Limited, of Toronto. The contract is for 40 arc lights of 2,000 c.p., and the price is $40 per light per year, all public buildings belonging to the corporation to be lighted free. The rate for private lighting is to be 8 cents per kilowatt, with 25 per cent. discount if paid by the 15th of each month.

R. L. Worthington, who has severed his connections with the Vulcan Iron Works, of Winnipeg, entertained the foreman and office staff at a tea on Jan. 7, when he was presented with a beautiful combination desk and book case. Mr. Worthington is resigning his position as draughtsman after six years with the Vulcan Works, to accept a similar position with Kelly Bros. & Mitchell, Winnipeg.

Winter doesn't stop building in Canada as is intanced by the large number of permits for new buildings which have been issued during December and the present month in all parts of Canada. For instance, in Toronto alone permits issued totalled to $961,000 in December and from Jan. 1 to 8 the amount was $367,000. The figures given by us in this issue in several cases cover the totals for the past year and are gratifying from every standpoint. Even more pleasing, however, is the certainty that 1907 will show even larger totals than the big records made in 1905 and 1906.

Samples of rock containing copper, found around the Moon River, in the district of Parry Sound, have been sent to New York for examination, and capitalists there lost no time in providing all necessary capital for thoroughly testing the find. Some of the recent assays from the present workings show well the composite character of the vein matter. They gave silver 20 ounces, copper 22 per cent., gold from $10 to $500 per ton, with values in platinum, cobalt and zinc. One of the largest crystals of mica that perhaps has ever been mined has been found in one of these mines, it being about the size of an ordinary door, and required no less than four drill holes to dislodge it. The mica found, though dark in color, contains no iron, and improved in quality with depth.

At Fort William gigantic works are being constructed for the Canadian Iron & Foundry Co., where employment will be given to 500 men. Seven large buildings are now under way, these being of steel and concrete. The company own 25 acres of land and have 1,000 ft. of river frontage. They will handle their own ore, etc., by water, necessitating the building of a large dock equipped with a modern coal and ore handling plant, which is now under way. The size of the new buildings under construction are:

Pipe foundry	221 ft. x 55 ft.
Dressing shed	202 ft. x 63 ft.
Pipe coremaking room	145 ft. x 63 ft.
Cupola room	116 ft. x 55 ft.
Grey iron foundry	141 ft. x 55 ft.
Car wheel foundry	141 ft. x 55 ft.
Machine shop	110 ft. x 55 ft.

The Manson Mfg. Co., Limited

THOROLD, ONT.

New Foundry and Machine Shop.

New Liskeard is to have a new foundry and machine shop in the very near future. H. M. McEwen of Carleton Place, for many years with Gillies Bros., has purchased a site and will commence work on the foundry as soon as the snow is off the ground. It is proposed to put in an up-to-date machine shop and foundry equipment and to put on a staff of first-class machinists, molders, boilermakers and blacksmiths.

Magnetic Arc Lamps.

The town of Westmount, Que., awarded a contract to the Canadian General Electric Co. of Toronto, for the entire equipment necessary for the installation of 150 magnetic arc lamps. This system was completed and put in operation last month, and the results far exceeded the expectations, the streets of Westmount now being the best lighted in Canada, and also the first by magnetic arc lamps.

These lamps give a very powerful, steady, white light, the arcs being much wider than the older types and therefore cast less shadow. They also consume about one-third less current, and have a much longer life.

Galt's Growth.

Galt has given substantial evidence in the way of growth by the erection of 112 dwelling houses. The manufacturing part of the town, has also shown a decided increase, some new firms starting, and a number of old ones adding considerable floor space, 314,710 square feet being added to 15 enterprises, divided viz.: Galt Knitting Company, 87,500 square feet; MacGregor, Gourlay Company, 84,845 square feet; Malleable Iron Company, 36,991 square feet; P. W. Gardiner & Son, 22,400 square feet; Sheldons, Limited, 21,000 square feet; R. McDougall Company, 13,200 square feet; Galt Robe Company, 10,360 square feet; Cowan & Company, 10,230 square feet; McVicker Engine Company, 9,548 square feet; Box Factory, 4,950 square feet; J. J. Stevens Company, 4,100 square feet; Victoria Wheel Works, 3,600 square feet; Peter Hay Knife, 1,600 square feet. The total amount of money expended for building purposes in Galt in 1906, was $560,000.

Canadian Shipbuilding

A well organized and energetic movement is on foot in the Maritime Provinces to build up the steel shipbuilding industry. A statement summing up the argument in favor of a tonnage bonus on steel ships built in Canada was lately submitted to the Tariff Commission, and the Dominion Government has been memorialized to grant such a bonus on a basis of $6 per gross ton. The Boards of Trades and municipal councils of Halifax, Dartmouth and other places have taken the matter up, and much interest is felt regarding the manner in which the request for a bonus will be treated at Ottawa. Years ago in Eastern Canada, shipbuilding assumed very large proportions, but with the advent of steel construction it rapidly declined. Steel vessels can be built cheaper in British yards on account of the cheaper iron, coal, and labor there Those who agitate for a bonus on steel ships point out that all maritime nations give protection to their shipping. There is an increasing demand in Canada for steel vessels for both coastwise and lake trade, but it is claimed that Canadian yards cannot compete with British and foreign builders in this line of construction. It is pointed out that Canadian built tonnage has decreased in less than 30 years from 183,000 to 33,000, while the entries in and out from sea have increased from six to sixteen millions, the coastwise shipping from ten to forty-five millions, and the Great Lakes tonnage has more than doubled. There are now in Canada, besides several smaller firms, four large steel shipbuilding companies—the Algoma Steel Company, Sault Ste. Marie; the Canadian Iron Furnace Company, Montreal; the Collingwood Shipbuilding Company, Collingwood; and the Canadian Shipbuilding Company, Toronto. These yards are not all fully and steadily employed, and it is suggested that while many millions of dollars are being expended in Canada in nearly every industry, including iron and steel, it is time we should build our own ships and do our own carrying trade.

Companies Incorporated

Otonabee Power Co., Ltd., has been granted power to increase the capital stock of the company from $200,000 to $600,000.

The Burlington Masonic Hall Company, has been incorporated with a share cpaital of $10,000 for the erection of a hall for the Burlington Masonic Lodge.

Butler Bros.-Hoff Company, incorporated under the laws of the State of New York, have received a license to carry on work, as builders, contractors and decorators in Ontario.

Gibson Mfg. Co., Ltd,. Guelph, capital $50,000, purpose to manufacture and deal in gasoline engines. Directors are: John Gibson, H. H. Bolens, Port Washington, Wis.; C. L. Dunbar and J. W. Lyon, Guelph.

The W. I. Kemp Co., Ltd., Stratford, capital $300,000, purpose to manufacture agricultural machinery. The directors are: W. I. Kemp, Stratford; N. J. Kemp, J. S. Lewis and J. S. Kemp, Newark Valley, N. Y.

Dominion Car & Foundry Co., Ltd., capital stock $5,000,000, to manufacture cars, rolling stock, for railways. Directors, W. B. Kelley, R. P. Lamont, W. W. Butler, G. McAvity and A. H. Chave. head office, Montreal.

The Lufkin Rule Company, a corporation incorporated under the laws of the State of Michigan, have been granted a license to manufacture all kinds of measuring articles, tools, machinery, etc., in Ontario.

The Craig Harness Company has been incorporated with a share capital of $100,000, and head office to be at Ottawa. The provisional directors will be R. Craig, J. H. Cameron, and C. H. Clendenning, of Ottawa.

St. Catharines Drilling Co., Ltd., share capital $40,000, incorporated to drill for natural gas, oil, petroleum, salt and similar products. Directors, N. L. Nelson, P. I. Price, H. H. Collier, with head office at St. Catharines, Ont.

The Meisel Mfg. Co., Ltd., Port Arthur, capital $350,000, purpose to manufacture and repair all kinds of machinery. The directors are: F. W. Woods, G. C. Meisel, R. Mc. M. Meisel, all of Port Huron, and James Conmee, Port Arthur.

Central Foundry, Limited, has been incorporated with a share capital of $200,000.00, to carry on a general foundry business, with head office at the city of Toronto. Directors to be H. L. Bowers, H. T. Bush and R. C. Donald.

The Shedrick Rigby Co., Montreal, have been incorporated with a capital of $20,000, to manufacture machinery, electric appliances, etc. The charter members include C. E. Shedrick, J. S. Rigby and P. C. Ryan, Montreal.

The Collingwood Shipping Co., capital share $90,000, incorporated to operate steamships, elevators, etc. Directors to be W. T. Allan, M. Brophey, J. R. Arthur, W. A. Hogg and W. Carmichael, with head office at Collingwood, Ont.

The Gundy-Clapperton Co., Toronto, have been incoporated with a capital of $40,000, to manufacture cut glass, silver, jewelry, etc. The provisional directors include N. F. Gundy, H. G. Clapperton and W. H. Wise, Toronto.

Mussens Ltd., Montreal, capital $500,000, purpose to carry on the business of W. H. C. Mussen & Co., dealers in railway supplies, etc. The directors are: W. H. C. Mussen, Geo. Boulter, G. G. Foster, C. G. McKinnon and W. R. Staveley, all of Montreal.

Cobalt and New Ontario Prospectors, Developers and Investors, Ltd., Toronto, capital $500,000, purpose to carry on the business of a mining, milling, reduction and development company. The directors are: J. Q. Ross, A. W. Holmested, F. H. Potts and A. R. Bickerstaff, all of Toronto.

The Oil Well Supply Company, a corporation incorporated under the laws of the State of Pennsylvania, have received a license to deal in iron and steel, or any other metals, or any articles of commerce from metal or wood in Ontario.

Landscape Engineers

We are the largest Canadian nursery company in this branch of the trade.

Detail plans and specifications for planting of homes, parks and manufacturing sites, at reasonable prices.

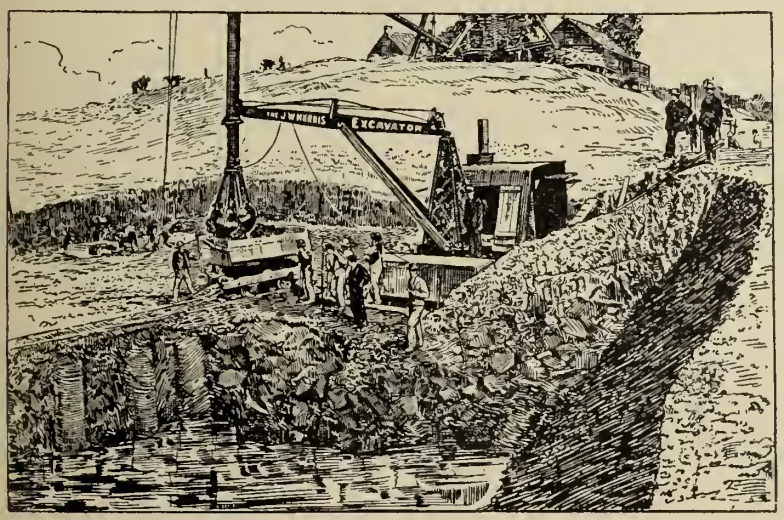
THE J. W. HARRIS EXCAVATOR

(PATENTED IN ALL PARTS OF THE WORLD)



This is one of the GREATEST INVENTIONS KNOWN for all KINDS OF EXCAVATING and TRENCHING WORK.

DOES the work of 50 to 100 men. Made in three sizes, with half, three-quarter and one yard orange-peel and clam-shell buckets.

Suitable for Railway Construction, Sewer and Water works, Crib work, Irrigation work, Coal and Ore docks, Brick yards and Cement works, etc., etc.

FOR FURTHER INFORMATION AND CATALOGUE, APPLY TO

The J. W. HARRIS CO., Limited, Montreal, Canada

The Clifton Sand, Gravel & Construction Co., St. Catharines, Ont., have been incorporated with a capital of $250,000, to manufacture stone, gravel, gas, oil, etc. The provisional directors include P. I. Price, H. Yale, and G. F. Peterson, St. Catharines, Ont.

The Western Rubber & Apparatus Co., Winnipeg, Man., have been incorporated with a capital of $25,000 to manufacture rubber goods, fire apparatus, etc. The provisional directors include R. M. McLeod, A. A. Andrews, and J. H. Anderson, Winnipeg, Man.

The Well Machine and Wind Mill Company, has been incorporated with $20,000 capital; provisional directors: C. S. Tyrrell, merchant; J. H. Inkster, agent; H. W. Hutchinson, manager; W. S. Evans, financial agent; J. A. Machray, barrister-at-law, all of Winnipeg.

The Standard Concrete Construction Company has been incorporated with a share capital of $100,000 for general building construction, with head office to be in Toronto. Directors will be F. Rielly, G. Sutherland, E. Denton, J. B. Bartram and E. A. Scott, all of Toronto.

The Sherbrooke Novelty Company has been incorporated with a share capital of $20,000 for the purpose of manufacturing electrical and mechanical appliances, household utensils and smallwares. The head office will be at Sherbrooke, Que., and the directors will be E. R. Ebbitt and A. C. Snowden, Montreal; R. A. Wright, A. T. Boydell and J. A. Swan, Sherbrooke.

The Canadian General Industrial and Development Company, has been incorporated with a share capital of $150,000, with head office at Chatham, for the purpose of sinking wells, boring for oil, natural gas, etc. The provisional directors of the company will be O. B. Sargent, J. M. McCoig, and W. A. Hadley, of Chatham.

Beehtels, Limited, has been incorporated with a share capital of $75,000, for the purpose of manufacturing brick, tile blocks, and cement products. The head office will be at Waterloo, and provisional directors will be: B. E. Beehtel, W. B. Beehtel, W. J. Watson, C. E. Whyard of Waterloo; C. H. Beehtel, of Berlin, and P. A. Watson, of Galt.

The Western Canada Development Company has been incorporated with a $1,000,000 capital, to carry on business as miners, coal miners, oil producers, refiners and gas makers, in any part of the Dominion of Canada with head office to be at Winnipeg, incorporating J. S. Hough, A. C. Ferguson, C. Williams, F. B. Lindsay and W. M. Graham, all of Winnipeg.

The Schultz Manufacturing Company has been incorporated with a share capital of $50,000 to purchase the business of Ernest Schultz, known as The Schultz Manufacturing Company, makers of stamped, pressed and spun metal goods, castings, lamps, lanterns, etc., with head office at Hamilton and directors to be E. P. Schultz, A. H. Brittain and E. A. Schultz, of Hamilton.

PATENT RIGHTS FOR SALE

A U. S. firm manufacturing Graphoil Lubricators and Steam Cylinder Graphite Cups would like to correspond with reliable party with a view to introducing their goods on a commission basis in Canada, or would negotiate for the sale, in whole or in part, of Canadian patent rights. Address in first instance Box 51L, CANADIAN MACHINERY, Toronto.

Province of Quebec, District of Bedford } SUPERIOR COURT.

IN THE MATTER OF

The Philipsburg Milling Co.

IN LIQUIDATION.

NOTICE IS HEREBY GIVEN that in pursuance of an order granted by the said Superior Court, all the assets of the above Company in Liquidation, comprising the building in which the Mill is situate, and all the plant and accessories, will be sold at Public Auction, to the highest bidder, either *en bloc* or in lots to suit purchasers, on the ***ninth day of February*** next, at ***two o'clock in the afternoon,*** at the premises of the Company in the ***Village of Philipsburg, Que.***

The Mill is completely equipped for a general milling business as well as for the manufacture of prepared foods, and both the building itself and the entire plant are practically new, having been in use only a few months.

The plant includes among other things: 16 H.P. Gasoline Engine, Clark Grinder, Corn and Cob Crusher, Stones, Smutter, Bolts, etc.

For further particulars apply to the undersigned.

W. FREDERIC KAY,
Liquidator, Philipsburg, Que.

CANADIAN AGENCY

Power Presses and Dies Shearing Machines, Etc.

Wanted a first-class sole agent or representative working on commission to sell our manufactures in Canada. Revised Canadian Tariff should offer opportunities for good business.

We are the best and largest English Press manufacturers and prices are most reasonable.

Sole Agency given to person thoroughly understanding Presses, Dies and Sheet Metal Machinery.

J. RHODES & SONS, Limited, Grove Iron Works, WAKEFIELD, ENG.

SUBSCRIPTION CANVASSER WANTED.

Bright young man wanted to canvass for subscriptions to CANADIAN MACHINERY AND MANUFACTURING NEWS. One who has been connected with machine shop, or with some knowledge of mechanical subjects preferred. This offers good opportunity for advancement to the right man. Apply to

WESTERN REPRESENTATIVE WANTED.

AN agent in the west to handle Beardshaw's "Conqueror" high speed steel and drills, which are meeting with a favorable reception throughout Canada. Alex. Gibb, 13 St. John St., Montreal.

FOR SALE

$600.00 WILL buy Patterns for the following size gasoline engines: 3 and 6 horse power stationary; 5 horse power double opposed air cooled; 16 horse power double opposed cylinder; 12 horse power double upright, stationary; 10 horse power double upright auto or marine; 40 horse power, 4 cylinder marine. All in good order. Have built several hundred high grade engines from these patterns. D. McKenzie & Co., London, Ont. [1]

A COMPLETE LINE OF ROADMAKING machinery, consisting of rock crushers, road graders, scrapers, dumping wagons and Robinson's cement tile moulds; send for a booklet. Climax Road Machine Co., Hamilton.

FOR SALE—A fully equipped Wire Mill and Nail Factory as a going concern, with about 500 tons of wire rods; factory situated on 150 ft. of waterfront with trackage optional to buyer. B.C. Wire and Nail Co., Limited, Vancouver, B.C. (2)

BELTING, RUBBER, CANVAS AND LEATHER, Hose, Packing, Blacksmith's and Mill Supplies at lowest prices. N. Smith, 138 York Street, Toronto. (2tf)

SITUATIONS VACANT

WANTED—AT ONCE—MACHINIST and planer hands; also general blacksmith; state experience and wages. The Waterloo Manufacturing Co., Waterloo, Ont.

WANTED — FIRST-CLASS MACHINIST — with some experience on iron patterns. Gurney Foundry Co., Limited, Toronto Junction.

WANTED — AT ONCE — FIRST-CLASS TOOL grinder, for Landis and Hendy-Norton machines; also several first-class machinists for lathe work. Apply Canada Cycle & Motor Co., Limited, Toronto Junction.

SITUATIONS WANTED

ENGINEER AND DRAUGHTSMAN (25), salt and salt making machinery; small marine and mill; technical training; requires position. A. M. Mere Heath, Davenham, Cheshire, England.

APPRENTICES

can Bank **Money** in a few weeks.
Work will take but a few hours a week.
You Need no Money because we provide the capital.
We will start you in business by sending you your first stock without charge. The money from the sales of these will be used in buying new stock
If you will try it, we will send supplies at once. Your profits are large.

IN ADDITION

there are bonus prizes: a watch is one of these bonuses.
Some boys and youths are earning a large sum each week as extra money.

...THE...

Financial Post

Was as inevitable as it was necessary

FIRST ISSUE
25,000 COPIES

Saturday, JAN. 12th, 1907

This Weekly will contain all the financial news available on investments. Accuracy is aimed at, but technicality is avoided.

The Post will print reliable news in a readable manner. Finance has its romances as well as its dry bones.

Every Investor, large or small, can find something that will interest him. Canadian securities will be fully and completely dealt with each week.

A page will be devoted to banks and banking interests. There will be special articles for depositors.

Every Young Man determined to make a success of life will be interested in the self-help articles.

SPECIAL FEATURES OF THE FIRST ISSUE

THEN AND NOW—An entertaining and instructive story in parallel columns, showing what a well-known London paper thought of C.P.R. in 1881, and what it thinks 25 years later.

THE GRAND TRUNK PACIFIC—AN INVESTOR'S ANALYSIS—THE QUESTION OF FIXED CHARGES—A COMPLETE MAP OF THE SYSTEM.

THE HUDSON'S BAY COMPANY—The graphic story of the market advances of our oldest joint stock company.

Other special articles by expert writers on Municipal Bonds, the Grain Situation in the West, Branch Banks in the North-West, Cobalt Considerations, the Saving Habit.

THE FINANCIAL POST OF CANADA is a twentieth century newspaper which no investor in Canada—especially at this time—can afford to be without.

Mailed to any address in the Dominion, United States, Great Britain, and Europe for **$3.00 annually.**

"MONEYBACK"

¶ This proposition applies to all of our facings. In addition we add—Keep what you use for test purposes with our compliments, and if not satisfactory, return what is left, charging us freight and cartage both ways.

OUR THREE LEADERS:

¶ No. 17 Facing as a Core Wash will stay in solution better than anything on the market, and also makes a good cheap bag dust.

¶ Our No. 44 Mexican Plumbago as a bag dust is unexcelled.

¶ Our No. 47 East India Plumbago will favorably compare with English Lead, at a saving in price.

¶ We grind all our own facings and know this to be right. Tell us your troubles—we will be glad to consult with you.

Large stock on hand at our Windsor warehouse.

If you have not used this brush, order a sample lot to be forwarded with next shipment.

Rice's Patent Bridled Casting Brush

Casting brushes go to pieces because the end wires break off. Unhindered vibration causes this breaking. Our Patent Hinged Bridle prevents the vibration and the consequent breaking, making the brush last twice as long as the ordinary casting brush. The bridle is hinged to move freely so that the brush retains its flexibility.

NOTE.—We have recently acquired rights to the patents on this brush and are now the SOLE MANUFACTURERS.

YOUR MACHINE PAINT

is possibly not up to the standard. Perhaps it does not give you the satisfaction you would like.

WE manufacture a splendid line of paints for the special use of machinery manufacturers who require a good, easily applied, hard wearing, and beautifying paint.

IT is made in paste form and can be used as a filler, applying with a knife. For brushing purposes it may be thinned with turpentine.

OUR PAINT has great covering capacity, spreads freely and leaves a good surface.

STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

Improved Levels for Testing Shafting, etc.

In addition to the regular parallel vial, the bases have a cross level which enables one to place or hold the base on a shaft level in its cross section, not canted sidewise; for the shape of a level glass is such that, though true as adjusted on a flat surface, it will not be reliable when canted sidewise. Hence the value of the cross level, not only to test the truth of shafting, but other surfaces which tend to throw the level base into a canting position.

The base of this level has our improved concaved groove running through the length of its base, leaving a flat margin each side, which improves its seat for flat work, while forming an absolutely true and reliable seat for shafting, etc., and it is better than a V groove. Made in 6, 8, 12 and 18 in. sizes with plain vials and with ground and graduated vials.

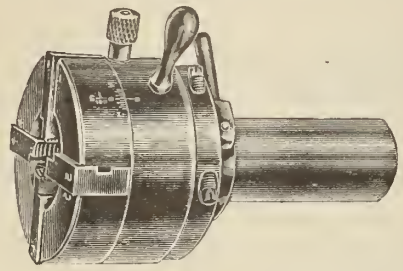
Responsible Agents Wanted in the West

Have you Large Quantities of Duplicate Threads to Cut?

IF SO, YOU NEED OUR



Geometric Self-Opening Screw-Cutting Die Heads

After you have used them a short time you will wonder how you ever got along without them, as they save at least one-half the time required in cutting threads with solid dies,

These Die Heads are adapted for cutting any size or style of thread, right or left hand, and the length of thread is limited only by the travel of the turret slide. They open automatically at the end of the cut, thus averting danger of spoiling work and saving the time usually wasted in running back over finished threads.

We would like to send you our catalogue.

Technical Books

Modern Machine Shop Tools

Their Construction, Operation and Manipulation, including both Hand and Machine Tools.

By W. H. VANDERVOORT, M.E.

Large 8vo. *555 Pages* *673 Illustrations*
Bound in Cloth *Price* ***$4.00***

An entirely new and fully illustrated work treating the subject of ***Modern Machine Shop Tools*** in a concise and comprehensive manner. The work is logically arranged; the various hand and machine tools being grouped into classes, and description of each is given in proportion to their relative importance. The illustrations represent the very latest tools and methods, all of which are clearly described. Each tool is considered from the following points: *First*—Its construction, with hints as to its manufacture. *Second*—Its operation, proper manipulation and care. *Third*—Numerous examples of work performed.

Compressed Air

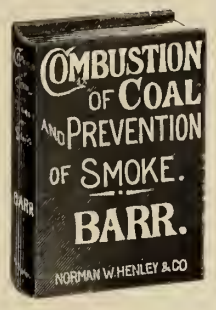
Its Production, Uses and Applications

By GARDNER D. HISCOX, M.E.

Large Octavo *820 Pages* *545 Illustrations*
Bound in Cloth *Price* ***$5.00***

A complete treatise on the subject of compressed air, comprising its physical and operative properties from a vacuum to its liquid form. Its thermo-dynamics, compression, transmission, expansion, and its uses for power purposes in engineering, mining and manufacturing work. Air compressors, air motors, air tools, air blasts for cleaning and painting. The sand blasts, air lifts for pumping water, oils and acids, submarine work, aeration of water, railway appliances and propulsion. The air brake, pneumatic tube transmission, refrigeration and eold rooms. The hygiene of compressed air, its liquefaction and phenomena, including forty tables of the physical properties of air, its compression, expansion, and volumes required for various kinds of work, and a list of patents on compressed air from 1875 to date.

These forty air tables cover most of the relations of our atmosphere and its contained moisture in its various conditions, from a vacuum to its highest pressure, and its power for work; its final liquefaction and the phenomena of extreme cold,



A Catechism on the

Combustion of Coal

and the Prevention of Smoke

A practical treatise for Engineers, Firemen and all others interested in Fuel Economy and the Suppression of Smoke from Stationary Steam Boiler Furnaces and from Locomotives.

By WILLIAM M. BARR, M.E.
Author of "Boilers and Furnaces," etc.

One Volume *350 Pages* *85 Engravings*
Price ***$1.50***

This book has been prepared with special reference to the generation of heat by the combustion of the common fuels found in the United States, and deals particularly with the conditions necessary to the economic and smokeless combustion of bituminous coals in ***Stationary and Locomotive Steam Boilers.***

The method of treatment consists of a systematic and progressive series of questions covering every detail relating to the combustion of fuels for the purpose of generating heat; the answers to these questions are practical and direct, and to better illustrate certain subjects that could not otherwise be made clear, eighty-five engravings have been especially prepared which admirably supplement the answers to which they belong.

Dies

Their Construction and Use for the Modern Working of Sheet Metals

By JOSEPH V. WOODWORTH

384 Pages *Bound in Cloth* *505 Illustrations*
Price ***$3.00***

This work is a complete treatise upon the Designing, Construction and Use of Tools, Fixtures and Devices, together with the manner in which they should be used in the Power Press for the cheap and rapid production of the great variety of Sheet Metal articles now in use. It is designed as a guide to the production of Sheet Metal parts at the minimum of cost with the maximum of output. The hardening and tempering of Press Tools and the classes of work which may be produced to the best advantage by the use of Dies in the Power Press are fully treated.

The book was written by a skilled and successful workman, and is one that Die-makers, Machinists, Tool-makers and other metal-workers connot afford to be without.

TIME IS OFTEN MORE IMPORTANT THAN COST

THE UNITED STATES BORING TOOLS

save time at critical moments, as they can be used for a wide range of work.

¶ In our Lathe Department we often do a job of drilling, counter-boring, reaming and tapping with one setting of a United States Boring Tool. The time saved in finding the centre for each operation is quite an item.

¶ The special steel forged shank rigidly supports the boring cutter; the cap prevents the mutilation of tools, and the offset head permits the use of long cutters.

A Full Line of Tools shown in Catalogue No. 6.

THE FAIRBANKS COMPANY
SPRINGFIELD, OHIO

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates, **payable in advance**:—

For the United Kingdom	£1 9 2
For all places abroad:—	
Thin Paper Copies	£1 16 0
Thick "	£2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

Prepaid Advertisements on Wrapper, **classified** under headings: Tenders—Appointments Open—Situations Wanted—Partnerships—Wanted, &c.—For Sale—Auction Sales—Publications—Miscellaneous—Patent Agents—&c.

By the Line—Four Lines or under, 3s., each additional Line, 8d. The Line averages Seven Words.

By the Inch—8s. per Inch Single Column, One Insertion.

5% allowed on 6, 10% *on* 13, 15% *on* 26, *and* 20% *on* 52 *Insertions.*

Advertisements intended for insertion in the current week's Issue must be delivered not later than 5 p.m. on Thursday.

For Displayed Adveritsements, Special Terms are given.

Offices of "ENGINEERING," 35 & 36, Bedford Street, STRAND, LONDON, W.C.

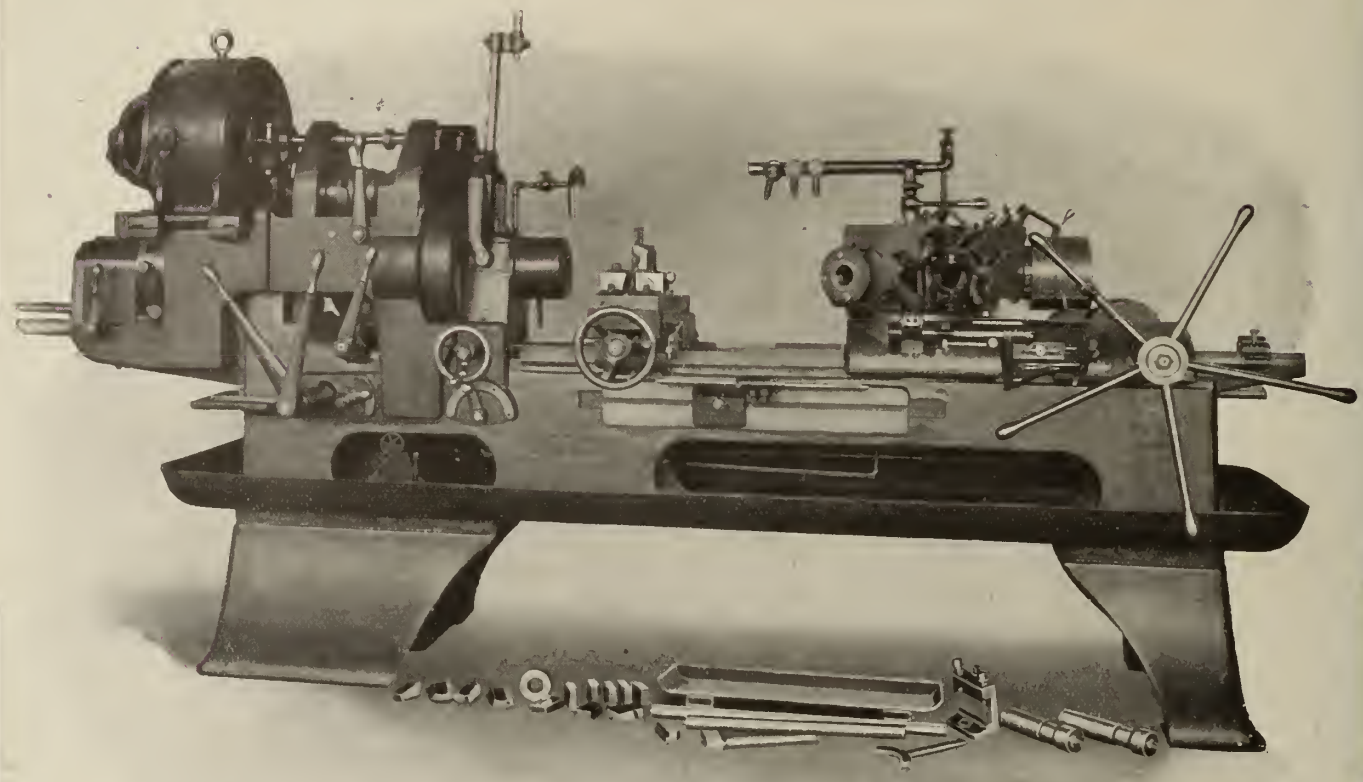
Our new catalogue giving general dimensions of the full line of Planing Machines we manufacture will be sent on request.

THE JOHN BERTRAM & SONS COMPANY, Limited

DUNDAS, ONTARIO, CANADA.

TURRET LATHES

FIVE SIZES, $\frac{5}{8}$ x 4½-inch, 1 x 10-inch, 2 x 26-inch, 3 x 36-inch.



3 x 36-inch Pratt & Whitney Turret Lathe, driven by 5 h.p.' motor.

The motor drives through a speed-box which, with the double friction back-gears, affords a wide range of speeds.

Cross and longitudinal power feeds are positive geared, reversible, and have automatic stops in either direction.

The cross slide permits the use of larger forming tools than can be held in a turret and makes possible the use of three turret tools at one time.

Dry Kiln, with Special Moisture Extractor

¶ Study that cut for a few moments. It will pay you to do so. There you have a Dry Kiln that is a Dry Kiln——a two-room progressive Dry Kiln. Each room is 45x17 feet and 9 feet high, with a lumber capacity of 25,000 feet and a drying capacity of 9,000 feet per day.

¶ Where other kilns have failed **This Kiln** has given the utmost satisfaction because it is scientifically constructed. We guarantee it to season more lumber than any other kiln on the market.

¶ **This Kiln** is so constructed and operated that it cannot Case Harden, Check, or Warp wood. And it cannot waste heat which all other kilns cannot help doing.

¶ **These are the most Economical Kilns** ever marketed anywhere at any price.

¶ **Fire Risks** are eliminated by the ingenuity and perfection of construction and

¶ **This Kiln costs less**, according to capacity and cost of running than any other kiln ever built.

Our new plant, being equipped with the latest and most modern machinery, we are prepared to manufacture and instal promptly everything in

For Isolated Lighting Plants

the Sturtevant Generating Sets are especially adapted because of their high efficiency and compact construction. These distinctive features of the type here shown were developed under rigid specifications.

A 100 K. W. vertical generating set can be located in a space measuring less than 6 feet wide, 9½ feet long and 8 feet high; will operate at a combined efficiency of over 86 per cent. and will consume not exceeding 31 pounds of water per K. W. hour.

We also build 31 other sizes and styles of generating sets under 100 K.W. All but the largest can be delivered completely set up and ready for operation. Send for Bulletin 63.

Return Tubular and Locomotive Fire-Box Boilers Tanks, Stacks, Rivetted Pipe.

THE MANITOBA IRON WORKS, Limited, WINNIPEG, MAN.

VERTICAL ENCLOSED ENGINES

We are prepared to supply high speed vertical enclosed engines of the English type, up to 750 horse power.

The oiling system of these engines is under a pressure of 15 lbs. to the square inch, ensuring a copious supply of oil to all bearings.

They have Robb-Armstrong automatic governors and Sweet balanced valves, giving the best regulation and highest economy.

Modern Canadian Manufacturing Plants.

ARTICLE XXI.—Collingwood Shipbuilding Co., Collingwood, Ont.

Canadian Shipbuilding.

WHEN steel supplanted wood in the building of ships, Canada dropped her position in an industry in which she then held an important place. Through the neglect to follow up the opportunity offered in this line the Canadian Government failed to foster an industry which, had it been developed, would have meant millions of dollars being kept in the country which have gone to other nations to supply the ships necessary for our large and growing commerce.

The example of Great Britain along this line was one well worthy of being followed. As a pioneer and leading manufacturing country she early developed shipbuilding and for many years practically controlled this industry.

Collingwood Shipbuilding Co., Collingwood—Interior View of Machine Shop.

Collingwood Shipbuilding Co., Collingwood—View from the Harbor.

The Government of Great Britain, professedly for the purpose of her navy, yet designedly to encourage, develop and protect her trade and commerce on the seas, directly assisted and aided the British shipbuilders by the expenditure of millions of pounds sterling in contracts to the British shipbuilders, and further by the grant allowed on all merchant ships so constructed that in case of necessity they could be commissioned for naval service by the British Government. Other nations slowly awoke to the fact that they were helping to build up one of the greatest industries existing, in Great Britain, and since then have taken steps to establish shipbuilding within their own limits. The United States has spent, and is spending, enormous sums to encourage this feature of her industrial growth. Germany, France, Japan, Russia and Austria have all likewise taken steps in this direction. Canada's position along this line, as far as the Government is concerned, has been one of passive inactivity. The result of this is that our transportation by water has practically been usurped by other nations and in particular by the United States.

It goes without saying that Great Britain can manufacture ships much more cheaply than Canada. This for several reasons. In the first place, raw material, such as steel plates, shapes, bars, rivets and the like are furnished at their very doors, while Canadian shipbuilders have to pay freight thereon. Skilled labor is more plentiful and the cost of labor less. Coal supply is procured at less cost. The British Government and other Governments give British shipbuilders large contracts, enabling them to operate on a large scale and hence economically. The strongest point of all, however, is that British ships come into Canada free of duty and many are sold here, and at the same time are allowed to engage in Canadian transportation without restraint.

Collingwood Shipbuilding Co., Collingwood—One End of Punch Shed.

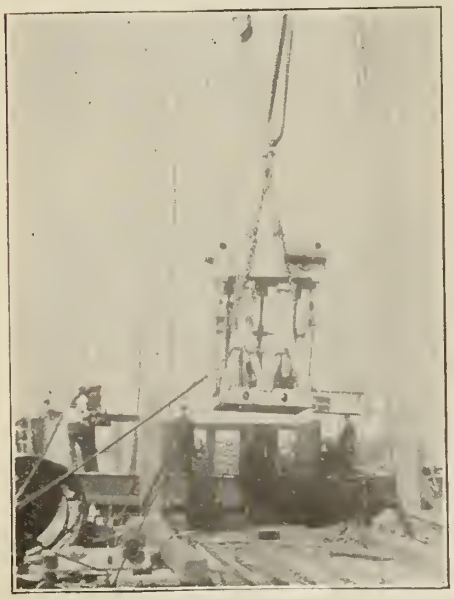
Coupled with this is the fact that the Canadian shipbuilder is penalized or restricted with a duty ranging from 25 per cent. to 30 per cent. on a large portion of the raw materials and parts necessary to shipbuilding, which have to be imported.

In 1902 the shipbuilders of Canada sent a memorial to the Government asking for a bonus or a subsidy to encourage this trade. On Nov. 22nd. 1906 the Tariff Commission was supplied with further information from prominent citizens of Toronto, Halifax and Dartmouth, showing the argument in the case of bonusing shipbuilding in Canada.

It is pointed out that no attempt has been made to meet the new conditions created by the use of steel. The industries operating in Canada are doing so heavily handicapped, and cannot hope to compete with British builders.

In Spite of Circumstances.

Regardless of the fact that shipbuilding in Canada is heavily handicapped, there are to be found several shipbuilding yards making steady progress, and one in particular, the Collingwood Shipbuilding Company, of Collingwood, Ont., that has of late years made rapid strides and employs to-day nearly 1,000 men. From various views shown some idea of the scope of this plant and the work done therein may be ascertained. The largest boat ever turned out in



Collingwood Shipbuilding Co., Collingwood—Hoisting a 400-H.P. Engine.

Canada, the "Midland Prince," with a length over all of 486 feet, was launched only a few months ago from its ways in this yard and is now being fitted up and will be completed before the opening of navigation this season.

The Works.

Besides the large dry dock and large space for outdoor construction, the permanent buildings of this company include a mould loft, punch shed, furnace shop, blacksmith shop, pattern shop,

Collingwood Shipbuilding Co., Collingwood—Hoisting-50 ton Marine Boiler on Board New 6,000-ton Steel Lake Steamer.

large modern boiler shop, foundry and machine shop of the same design, and permanent store rooms and office building.

Personnel of Company.

The company was reorganized in 1905 under the present management, which includes the following officers: President, Alex. McDougall, Duluth; vice-president, Thos. Long, Toronto; secretary-treasurer, Sandford Lindsay, Toronto; manager, Jas. M. Smith; assistant manager, D. B. Brown; chief engineer, F. E. Courtice; naval architect, P. W. Kelty.

Engineering Features.

In these works is manufactured everything used in connection with a ship, except, of course, the rolling of the various plates and angles, and some of the auxiliary machinery. Even to the engines and boilers, propeller wheels and shafts, the work is done within the limits of the company's yards.

The power for the plant is developed by a 300 h.p. tandem-Corliss engine, and immediately transformed into electrical energy by means of two 250 volt, 150 k.w. continuous current generators. From these power is transmitted to all parts of the plant where individual motors are used.

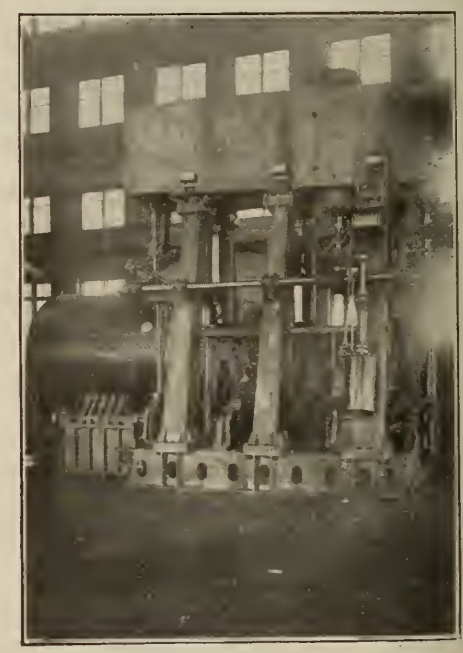
Compressed air plays an important part in a shipbuilding yard and without its use the modern methods could not be attempted. The continuous rap, rap, rap, of the shipbuilding yards is from dozens of air riveters. By means of the same agency chipping, caulking and drilling are accomplished. Not only in the actual shipbuilding but in the boiler, machine shop and foundry is it of service.

Machine and Boiler Shop and Foundry.

The boiler shop is equipped with a 60 ton hydraulic hoist of the company's own design, so arranged that all the movements of a 60 ton boiler can be easily controlled by one man, with three operating levers. Here will also be found a set of vertical rolls with an ultimate capacity of a 2 in. plate 12 ft. wide, operated by a separate double cylinder steam engine.

The hydraulic rivetter is the largest in Canada, being 11 feet vertical gap and is of the five stage type, having a range of pressure on the rivet as follows, 35 tons, 70 tons, 105 tons, 140 tons, 175 tons.

This building, as well as the foundry and machine shop, is of steel construction throughout, each is 120 ft. wide by



Collingwood Shipbuilding Co., Collingwood—1,000-H.P. Engines and Boilers.—Tug "Emerson," M.T.Co.

80 ft. long, with provision for doubling the length at any time. Each is equipped with a 35 ton electric traveling crane with 60 ft. span. Both the foundry and machine shop are likewise equipped with up-to-date machinery. A spe-

cial feature of the foundry is a 60 in. cupola with a capacity of 11 tons per hour.

Enormous Yard Crane.

Plans have already been made for the installation in the very near future of a 10 ton crane with a total travel of 560 ft. It will have a bridge span of 72 ft. with extensions at each end reaching over the dry dock at one end and over the yard at the other, giving a total bridge span of 122 feet. It is 60 ft. to the underside of the bridge girder to enable the crane to be moved over the entire length of ship under construction.

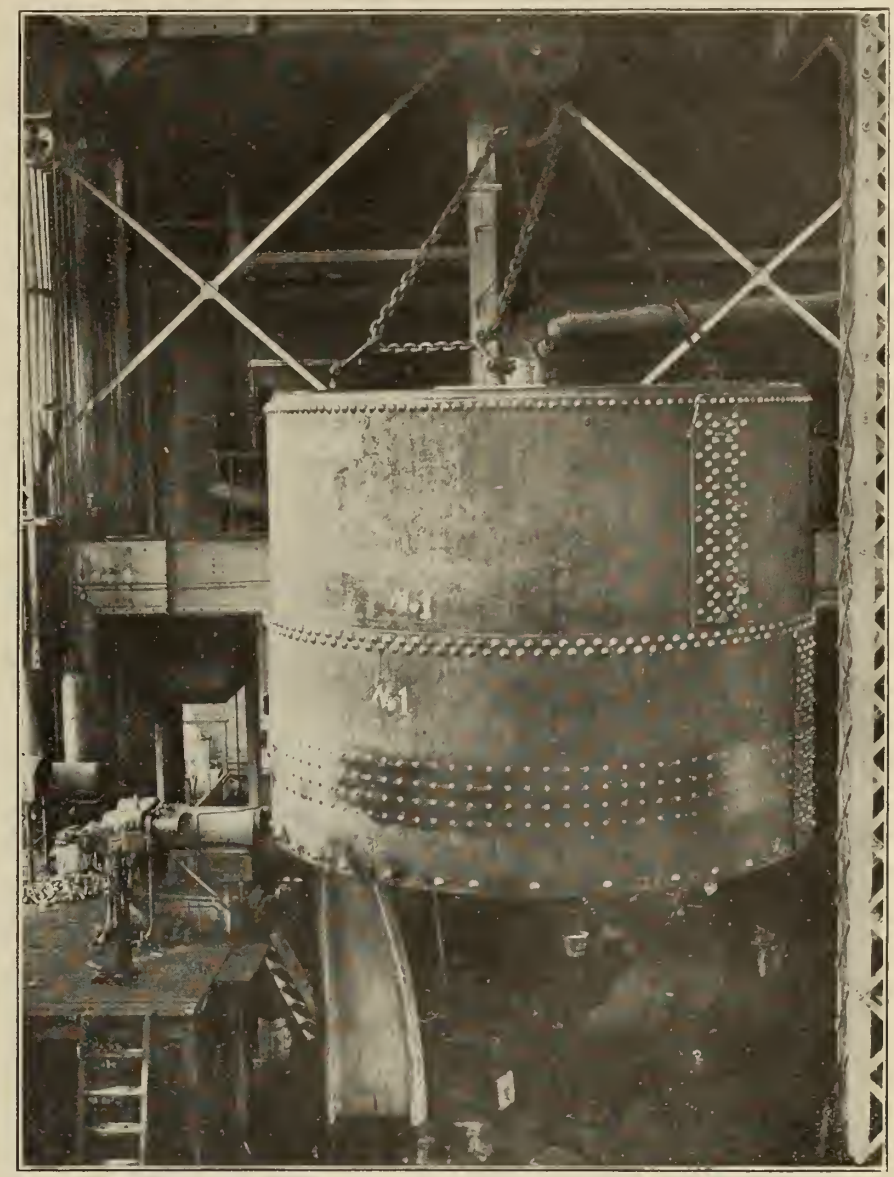
Some Work Done.

In speaking of the work done in the Canadian shipbuilding yards and comparisan made with work of other countries, it must be borne in mind that conditions here are altogether different and that shipbuilding, referring to the supply of labor only, is at a handicap. It is necessary to turn out the work with men unaccustomed to shipbuilding. Many of them have followed different trades or arrived with no particular trade and must be broken in. Under such conditions the turning out of a Midland Prince in eight months time is a creditable feat. She is the largest Canadian ship afloat on fresh or salt water service.

Some of the dimensions of this boat, together with a mention of other work turned out, will be found of interest. The Midland Prince, with a length of 486 ft. over all and 466 ft. between perpendiculars. The moulded breadth is 55 ft. and depth 31 ft. The engines are triple expansion, vertical with 42 in. stroke, cylinders being 23 in., 38½ in., and 63 in., respectively. Installed in this boat are the two largest boilers ever built in Canada. They are 15 ft. 6 in. diam., by 12 ft., each with three 51 in. furnaces and working under a pressure of 183 pounds per square inch. Weight of each boiler complete is 65 tons.

On the ways at the present time are three steel scows for the Dominion Government, each 144 ft. long, with a capacity of 500 cubic yards. Nearing completion is a tug for the Dominion Government 115 ft. over all, breadth 23 ft., depth, 11ft., engine triple expansion, 15 in., 25 in., and 41 in., and 25 in. stroke. One boiler 13 ft. 6 in., by 11 ft., 180 pounds per square inch.

Another steel boat is in course of manufacture for the Farrar Transportation Company, being 406 ft. over all, 50 ft. breadth and 28 ft. deep. The engines are triple expansion, 21 in., 35 in. and 57 in. by 42 in. stroke, with two boilers 14 ft. 6 in. by 12 ft., at a pressure of 180 pounds. Work is also under way changing the steel schooner Agawa to a steamer for the Algoma Central Steamship Co. This ship was built by this company in 1902, dimensions 389 ft. long, 48 ft. beam and 26½ ft. deep. She will be completely equipped as a modern lake type steamer throughout in machinery, cabins, etc. She will be driven by two Scotch marine boilers 14 ft. dia. by 12 ft. long, 180 lbs. working pressure. Engines are vertical triple expansion, 20 in. by 33½ in. by 55 in., by 40 in. stroke.



Collingwood Shipbuilding Co., Collingwood—Rivetting up the Largest Boiler Ever Built in Canada. 15 feet 6 inches diameter x 12 feet long; 185 lbs. working pressure.

A REMARKABLE WRECK.

AN extraordinary and expensive cement advertisement was furnished by a recent shipwreck. The ship Socoa, bound for San Francisco with a cargo of cement for use in the rebuilding of the city, was wrecked off the Lizard on the Cornwall coast. The ship struck a rock, which tore a large hole in her side, and remained fastened as upon a pivot. When the salvage crew arrived to see about taking the Socoa from her perilous position, says The Cement Age, the men found a remarkable condition of affairs. The water had entered the hold and its action upon the cargo had caused the cement to set. It had accommodatingly set hard around the rock that pierced the side of the ship, which now remains fastened there permanently in its unique position. The entire cargo has become as hard as stone, and nothing can be done with the ship except to dismantle as much of the wood as can be removed. The hull will remain there for many years as a conspicuous advertisement for the cement manufacturers.

That Electric Merger

NOT since the general public interest in hydro-electric power became a live issue in the minds of manufacturers and others in Ontario has any question arisen arousing more public interest than what has followed in the train of the incorporation of the Dominion Power & Transmission Co. by Dominion charter, with an authorized capital of $25,000,000. An air of mystery surrounded the incorporation and the only names mentioned in connection therewith have been those of Hon. J. M. Gibson and W. C. Hawkins, general manager of the Cataract Power Co. of Hamilton. Following closely the granting of the charter came the announcement that this immense company had absorbed the Cataract Power Co. of Hamilton. with its many subsidiary companies. The situation immediately assumed the aspect of a huge stock watering machine in which the rights of the Ontario Legislature were jeopardized and the possibility of the Hydro-Electric Commission of Ontario carrying out its programme nullified. The Ontario Government is up in arms and the Toronto Board of Control has taken action to have the Union of Ontario Municipalities (formed with the purpose of supplying cheap power to the various districts) discuss the question.

By gaining a Dominion charter and absorbing companies under the control of the province it would appear that this company was seeking to overcome provincial jurisdiction in its operations. Besides controlling electric power, the company also aims at operating smelting works, lumber mills, telephone and telegraph wires.

The Hamilton Cataract, Power, Light & Traction Co., with its stock at par value of $1,700,000, paying an annual dividend of $51,000, has by its absorption in the Dominion Power and Transmission Co., been increased to $5,100,000.

The Cataract Company owns and operates the following companies: (1) The Hamilton Electric Light & Cataract Power Company; (2) The Cataract Power Company of Hamilton; (3) The Hamilton Electric Light & Power Company; (4) The Electrical Power & Manufacturing Company; (5) The Dundas Electric Company; (6) The Hamilton Street Railway; (7) The Hamilton Radial Electric Railway; (8) The Hamilton & Dundas Street Railway; (9) The Lincoln Electric Light & Power Company.

Such companies are under the direct control of the Provincial Government, and both parties in the Provincial Legislature are prepated to stand by the rights of the province in such matters and oppose the Dominion Government as to their right to issue the charter given.

Discussing the question on the floor of the House recently, Premier Whitney reported as follows:

For several years there had been a steadily increasing list of applications to the Dominion Parliament for charters for companies declaring them to be to the general advantage of Canada, and which, necessarily, removed these companies beyond the jurisdiction of the province. He continued:

"That takes the enterprises as all honorable gentlemen are aware, out of our jurisdiction. It has been alleged—and, it may be truly alleged, it is a question that will have to be decided in the courts, I suppose—that all possible subjects, all possible enterprises of a business nature with reference to which a company may be chartered, can be taken out of the jurisdiction of this province by the insertion of those magical words, 'for the general advantage of Canada.'

"While it is so asserted, as a matter of law there has never been a decision. If that assertion is correct our jurisdiction here will simply be a nominal jurisdiction. As I understand it, Mr. Speaker, unless we disregard comity entirely, we would perhaps have no standing more than that we could object to the granting of original charters by the Dominion. But when we have instances like that quoted by my hon. friend, where a great blanket corporation is created, taking power to hide within its folds a number of short local electrical roads, which have been chartered by the Province of Ontario, and remove them from our jurisdiction; when that is being done I think the time has arrived for the Province of Ontario to interfere. Companies of that description come here. They get powers given to them which they cannot get from any power on earth except the Ontario Government. They exercise those powers, they make use of them, and they get by means of the exercise of those Provincial powers into a position where they have a financial standing.

"Then they go to the Dominion Parliament and ask to be put in this class 'for the general advantage of Canada,' which takes them out of the jurisdiction of the Province of Ontario, which created them, out of the jurisdiction of the Ontario Railway and Municipal Board, and out of the jurisdiction of this Legislature.

"I say, and I weigh my words well, that this Government will not submit unless it is compelled to. It is possible that it may be compelled. It is possible in other words, and I make no charge against the Dominion Government, but from what I have heard and a little of what I have seen I am afraid it will not be of much use to ask for reasonable terms from the Railway Committee of the House of Commons. I am not prepared to make charges against the Dominion Government, because I am not well informed of the facts which would justify any charges. But in reference to that class of companies where people come and get the great opportunities and privileges which they desire in order to use our highways, where they come to secure our endorsement of their agreements with municipalities, and then go to the Dominion Parliament to escape from the jurisdiction under which they came into existence, I think I have a right to say that any course which the Legislature of this Province may find it necessary to pursue will be a justifiable course.

"Hon. gentlemen will understand that neither myself nor any other member of the Government has had time since this charter was first brought to our attention to consider carefully and decide what our rights in the premises are. Therefore I will not attempt to suggest any remedy at this time. If all else fails us probably we have the power of taxation."

Hon. Geo. P. Graham, Leader of the Opposition, stated that the Liberal party would always be found where the interests of the province were jeopardized by Federal aggression, on the side of provincial rights, which evoked hearty enthusiasm from both sides of the House.

An interesting sequel is looked forward to as in this question financial, manufacturing, industrial and commercial interests are involved.

It is said that the cement works at Longue Point, near Montreal, operated by James Morgan, have been sold to the Fordwick Co., of Virginia, which has decided to establish a second plant in the vicinity of Montreal, costing in the neighborhood of $2,000,000, with a capacity of 6,000 barrels per day. The Fordwick Co. will also build large docks to store coal from Sydney. The engineering firm of W. S. Barstow & Co., of New York, are preparing the plans and specifications, and have given the building contract to the Canadian White Co., of Montreal. The new plant will employ from 1,000 to 2,000 men.

Civil Engineers Convention.

ON Jan. 29, 30 and 31, at their quarters in Montreal, the Canadian Society of Civil Engineers held its annual convention, which was largely attended by men from every province in the Dominion. A departure from the custom took place at this convention to the effect of devoting the time to business of the society rather than, as was usual, having papers read and discussed. It had been found in the past that too little time was left for the regular business of the society when a large portion of the convention was taken up with the discussion of papers.

The first days' meeting was devoted to the report of the Council and counting the ballots for the election of officers. The result of the elections was as follows: President, W. W. McLea, Walbank, vice-president and chief engineer of the Montreal Light, Heat & power Co.

Vice-presidents: Messrs. M. J. Butler, chief engineer railways and canals, Ottawa; Phelps Johnson, manager of the Dominion Bridge Company, and J. S. Dennis, chief engineer of the C. P. R. irrigation works, Calgary.

Council: Messrs. G. A. Keefer, Vancouver; D. McPherson, assistant chief engineer Transcontinental Railway, Ottawa; G. H. Duggan, second vice-president Dominion Coal Co., Sydney; C. E. W. Dodwell, engineer Public Works, Halifax; C. H. Rust, city engineer, Toronto; W. McNab, assistant engineer, G.T.R.; W. F. Tyre, Montreal; E. V. Johnson, Ottawa; W. H. Breethaupt, Perlin; J. A. Jamieson, R. S. Lea, R. A. Ross, G. J. Desbarats, John Kennedy, F. P. Gutelius, assistant chief engineer C. P. Railway; W. H. Laurie, Prof. R. J. Durley, L. G. Papineau and H. Hardman, all of Montreal, and A. A. Dion, of Ottawa.

This concluded the business of the convention, which adjourned shortly after noon. Later in the day the newly elected council met and appointed standing committee for the year.

On Wednesday, through the courtesy of the Montreal Street Railway, special cars were provided for the party, leaving Windsor Hotel at 9 a.m., whence they were conveyed to the works of the Simplex Railway Appliance Co., at Blue Bonnett. An interesting hour was spent going through this new plant, where bolsters and special apparatus for the manufacture of railway trucks are made. The economy of production in this plant was at once apparent. The latest devices and methods of transportation have been adopted to reduce the cost of manufacturing to a minimum. The oil blast furnaces were a feature of these works, one of their strong points being that they are completely under the control of the operator, regarding the supply of heat. From there the party journeyed to the enormous plant of the Canada Car Co., at Cote St. Paul, where they were entertained in a most hospitable manner to a bountiful luncheon.

Several hours were spent inspecting this enormous establishment, where from 12 to 20 freight cars are turned out complete every day. The president

MR. W. McLEA WALBANK
Newly-Elected President of the Canadian Society of Civil Engineers.

of the company announced that the building of the works had been done in record time, being accomplished during one of the severest winters Montreal has had, with deep snow to interfere with the operations, and hard frost to retard the laying of the concrete work, with which the walls are entirely composed. The works were built by Canadians, by Canadian capital, and, as far as possible, Canadian material, which is also true of the equipment. When the works started it was not expected to run the entire plant for some time, but already the company have contracts in sight to keep them running at full capacity for over a year.

Continuing their trip, the civil engineers journeyed back to the city and on through the works of the Canadian Rubber Co., where they had a chance of seeing the various processes in connection with the manufacture of rubber goods, including rubber belting, matting, hose, horse pads, water bottles, foot balls, clothing, boots, shoes and rubbers.

In the evening the annual banquet of the society was held at the Windsor Hotel. About two hundred members were present to celebrate the twenty-first birthday of the society. M. J. Butler, of Ottawa, Deputy Minister of Railways and Canals, occupied the chair in the absence of the retiring president, H. S. Lumsden, who called upon Mr. G. W. Stevens, president of the Harbor Commission, to propose the toast. Mr. Stevens congratulated the society and proceeded to point out what a debt the country owed the engineering profession for its advancement. They had done much that the country should be proud of. It was only necessary to mention the names of such men as Page, Shanley Gzowski and Keefer, to show the kind of engineers Canada had produced. Major Stewart Howard briefly replied to the toast, after which Mr. Butler proposed our guests, replied to by Mr. C. H. Catalli, president of the Chambre de Commerce, and Mr. King, of the Canada Car Co. The retiring president and council were proposed by Mr. C. E. Dodwell. Other toasts proposed were the sister professions, the visiting members, the press.

On the last day of the convention various matters in connection with the work of the society were discussed. The resolution was brought in appointing a committee on the standardization of cement, to collect all possible data and report to the society. J. A. Jamieson, of Montreal, introduced a resolution regarding sending a memorial to the Government regarding the selling of cement. According to the present custom cement is sold in barrels of 325, 350 and 375 pounds weight. It was suggested fixing the standard as a sack of 100 pounds, and that cement be sold by weight rather than by the barrel. This was heartily endorsed by the society.

The report of the year showed the affairs of the society in a most flourishing condition, both financially and as regards increased membership.

The Gzowski for 1906 was awarded to Walter J. Frances for his paper on "Mechanical Locks in Canada."

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

UNIFORM LEGISLATION FOR STEAM BOILERS.

ALL the large manufacturers of boilers in Canada are unanimous in their opinion that legislation in reference to land and stationary boilers is all too backward. As the situation now exists we have a Dominion Marine Act covering marine boilers but in no way affecting the use of other boilers in the various provinces. The fact that British Columbia has a law similar to the Dominion Marine Act shows the possibility of the same being applied to every province. As stated in the letter from Mr. C. H. Waterous, of Brantford, published in this issue, Alberta, Saskatchewan and Manitoba each have boiler laws different from the other, and less strict than the British Columbia law. Ontario has no special legislation regarding land or stationary boilers, and Quebec has a law different from the others, while the other provinces are similarly situated.

A valuable suggestion comes from Mr. James M. Smith, manager of the Collingwood Shipbuilding Co., regarding the appointing of a committee consisting of Messrs. F. E. Courtice, of the Collingwood Shipbuilding Co.; Arthur E. Spotton, of Goldie & McCullough, Galt; John Gerrall, Consulting Engineer, Toronto, and John J. Main, of the Polson Iron Works, Toronto, with power to seek assistance if necessary, with a view to framing a standard set of rules for stationary boiler building. This is a suggestion along the right line and, no doubt, could be acted upon with little difficulty. We would suggest to the gentlemen named that the question be taken up at once. It is an entirely different proposition going to the Dominion Government and asking for legislation along this line with nothing definite to propose, to being in a position to present a set of rules drawn out by men in an authoritative position. In the first case the Government would have nothing definite to act upon, and in the latter case they would have no reasonable excuse to set the matter aside.

Why let this matter drag on any longer? There is nothing like prompt and definite action in a situation of this kind, and we know that all manufacturers would like to see the question settled immediately. Canadian Machinery will heartiy co-operate with any effort made in this connection, and would appreciate any suggestion whereby this could be attained immediately. If the gentlemen named, together with others that might be, would be willing to spend a little time we are sure that success would inevitably follow, and a cause of annoyance removed for all time to come.

UPHOLDING PROVINCIAL RIGHTS.

THE formation of a twenty-five million dollar company with a Dominion charter and the powers granted therein, with what has followed in its train, has caused an upheaval in parliamentary circles in Canada. This is the result of a company's being able by Dominion charter to acquire rights vested under the jurisdiction of the Provincial Legislature. Following the incorporation of the Dominion Power & Transmission Co., with the above-mentioned enormous capital, came the absorption of the Cataract Power Co. of Hamilton with its subsidiary companies. These latter include four or five electric railways and several power companies, all enjoying their privileges under provincial control. The Ontario Government contend, and rightly so, that the Dominion parliament cannot grant a company such sweeping rights as to absorb companies not existing under charter and take them out of the control of the

province. The fight between the two governments is now on, involving a question of vital importance to every province in the Dominion. The Ontario Government is determined not to give in in the matter, both sides of the House being unanimous on the question. The Ontario Government has already commenced legislation covering the point in question that will be of a rather sweeping nature. It is hoped, however, the matter will be adjusted between the two governments satisfactorily to the best interests of the whole community.

COMMERCE FOLLOWS ADVERTISING.

AT the Canadian Club of Toronto, on Monday, Feb. 18th, Mr. John A. Cooper, stated that the old proverb, "Commerce follows the flag" had given way to a newer one, "Commerce follows advertising." This, he stated, was shown most emphatically in connection with the difference between British and United States trade with Canada. It is well known that the imports from the United States are many times greater than the imports from Canada, apart from geographical reasons. This is explained by the fact that Canadians have been educated to using United States manufactured goods from the medium of wholesale advertising in publications read by Canadians. An incident was stated of his going into a drug store and asking for a certain line of British made tooth powder. The druggist had never heard of it and produced four different kinds all manufactured in the United States. He said he must handle these because the people asked for them.

Why do people ask for goods of United States manufacture? Because they learn of them, see them advertised, become acquainted to some extent with their merit from publicity, and then become regular customers.

This is a pointed instance of the negligence of British manufacturers to a proper appreciation of Canadian trade. If appreciative, they do not employ the methods to any universal extent that are being found not only satisfactory but essential on the part of manufacturers of the United States.

If the British manufacturer wishes to secure Canadian trade there is nothing surer. "He must advertise his goods in Canada."

SELLING CEMENT BY WEIGHT.

A GOOD move was made at the recent convention of the Canadian Society of Civil Engineers when the members unanimously endorsed the selling of cement by weight. A committe was appointed to present a memorial to the Canadian Government petitioning them to legislate in the matter. At present the bulk of cement placed on the market is in barrels supposed to contain a standard weight when in reality they range all the way from three hundred and twenty-five to three hundred and seventy-five pounds per barrel. Ordering cement by the barrel is a misnomer unless the weight is specificially stated which in most cases it is not. Then on a contract of several thousand barrels the difference in weight may assume a serious amount. It was stated that the Dominion Government was one of the worst offenders contributing to such a condition of affairs. Being an enormous consumer of cement very few official contracts specify the amount a barrel shall contain.

In view of the fact that cement is much more easily handled in sacks and that one hundred pounds weight constitutes a reasonable package, it is proposed to suggest that this become universal practice in Canada. There seems no reasonable excuse that the Government should not fall in with the idea. It will not only remedy an existing evil in regard to weight but will standardize the hundred pound package which is a convenient one and which should meet with general approval not only on the part of contractors and cement users, but from the manufacturers themselves.

INADEQUATE PROTECTION AGAINST EXHAUST STEAM.

THOSE who have occasion to frequent the business sections of large cities cannot fail to have noticed that through careless discharging of exhaust steam from buildings there frequently descends upon passers-by a regular shower of condensed steam, with most annoying consequences. The nuisance referred to is common to all large cities, but in New York the newspapers are taking the matter up and pressing for the adoption of proper ordinances by which the municipal authorities shall have the power to restrict it.

Readers of this paper will be quick to recognize that the difficulty lies in the fact that the engineers in many of the large office buildings are not well acquainted with the fact that the use of exhaust heads would put an end to the discomfort they are causing the public. In all ower plants which are run, non-condensing exhaust heads should be considered an essential part of the equipment.

IMPORTANT ELECTRICAL ADVANCEMENT.

RECENTLY two announcements have been made of very great importance to applied electricity as concerning everyday life. On Feb. 11th, his sixtieth birthday, Thomas A. Edison announced that he had finally perfected his storage battery for electric motor vehicles. He proposes letting the public see them during the coming summer, believing that he has attained the highest point of efficiency. According to his own statement he has tried this battery under the severest circumstances, and the result warranting his prophecying that the new storage battery will solve the problem of vehicle transportation in great cities. Should Mr. Edison's confidence in his new invention not be over rated he will thus have conferred another boon to humanity, particularly to city dwelling mankind.

A few weeks previous to the above event Professor Parker, of Columbia University, and Walter G. Clark, electrical engineer, announced the substitution of helion for carbon in the incandescent filliment, with the result of reducing electrical lighting to one-third its present cost. This has been the result of several years' labor with the definite object in view of finding a more economical substance for incandescent filliment. The result of their researches is the substance which they have named helion, which is composed largely of silicon. At present it is expected that this lamp will cost more than the other, but besides consuming only a fraction of the current will last twice as long.

Cylinder Relief Valves*

By R. E. Johnson

WHEN I undertook the task of writing a paper on relief valves, I certainly had no idea of the extent of the subject, and to my surprise, as soon as I started I found out I was going to have a pretty hard task, to get up a paper that would bring out both the technical and practical points in regard to the benefits and use of a relief valve to the steam-working parts of a locomotive. I wrote to mechanical engineers of a number of different railways, both in the United States and England, for their views on, and experiences with, relief valves. Some of them gave me a few simple experiences, but none of them cared to talk about their benefits and functions, only saying they were used for relieving any undue pressure from various causes in the cylinders and steam chests. One gentleman, a superintendent of motive power of a foreign road, said, until I wrote him he had never taken the time to go into the matter; they were using them on the engines on his road, and they were doing the work they were supposed to do, of course, he said, "We have different sizes for different sized cylinders." What I consider one of the most important things in regard to relief valves, is the size of valve in comparison size of cylinder, yet, in answer to all my letters, not one gave anything definite about the sizes.

In looking up the meaning of relief valves in the dictionary, it explained that, "Relief valves are valves fitted to a boiler, steam-pipe, or cylinder, to relieve any excess pressure that might endanger the delicate and most important parts of a steam engine." By this definition, safety valves could be dealt with under the same heading as cylinder relief valves, but I am only going to take up the latter.

When a locomotive or, in fact, any steam engine is designed, the cylinders are made to stand a given pressure, which is, of course, above the boiler pressure—pressure causen by compression of steam in the cylinders. Now, on the cylinder walls is not where the pressure is greatest, but on the cylinder heads, as we find in the study of "Strength of Materials." The tendency of a cylinder subjected to internal pressure is to fail, or rupture, in the direction of its length.

Not so very long ago, when relief valves for cylinders were not used, a great deal of trouble was experienced by broken cylinder heads; the bore of cylinders was covered with grit and dirt, and the valves and seats were cut and grooved, causing delay to and expense against engines everywhere. Of course something had to be done to remedy this, and relief valves came into use. They were practically the same as our loaded spring valves of to-day, but there was no standard governing their size, and they were tried in different places about cylinders and steam chests. It was what was needed, and they began to improve in design until we have to-day a very nearly perfect relief valve.

About broken cylinder heads: Take an engine without relief valves running about 30 miles per hour, under a good head of steam. Something occurs that necessitates the train coming to a stop within a short distance. The engineer immediately reverses his engine and gives her steam in back gear. With this sudden strain, and if there is any condensation in cylinder in nine cases out of ten something has to go; if it is not the cylinder heads it is the steam chest; whereas, if the engine was equipped with relief valves, all that undue pressure would have been relieved. Another thing, in places where feed water is bad, and boilers dirty, the boiler primes, and water is carried into cylinders. There you will find, without relief valves, another case of broken cylinder heads; of course, if the engineer opened his cylinder cocks as soon as the boiler began to prime he might be able to save himself, but cylinder cocks are not to be relied upon in regard to size of outlet. A case happened to a switching engine in England: A heavy freight train was to be moved a short distance by a switcher. The engineer could not move the train at first. With wide open throttle he pulled the reverse lever from forward corner to back corner, and then, after taking up the slack, he threw her again into extreme forward gear. Before he had time to place his hand on the throttle smash went his cylinder head, and on getting down to examine it, he also found the valve rod bent just outside the steam chest. The mechanical engineer of the road told me that he had all his switching engines equipped with relief valves after that. I have noticed on our roads in Canada and the United States that it is a habit practised too extensively by the engineers on taking up the slack of a heavy train they leave the throttle open, while they reverse suddenly, instead of waiting a couple of minutes to allow the pressure in cylinders to subside. No matter if an engine is equipped with relief valves they won't stand much of that sort of usage.

Another little incident occurred on our own road not so very long ago: A dead engine, not uncoupled, was run around the yard and switched finally on the turntable. During the movements it had developed enough air pressure in the boiler to be able to work it into the shop. In this case the reverse lever was used to do this. Now, this engine was not equipped with relief valves, and during the movements it had sucked into cylinders, steam chest, and steam ways, sand, cinders, and dirt out of the smoke-box, thereby causing needless expense in taking out pistons and valves to have them cleaned. It would probably have been a surprise to them had they seen the inside of those cylinders, valves and steam ways. All this foreign matter tends quickly to destroy the usefulness of valves and piston rings by jamming and cementing rings and heads solid. Speaking about drawing foreign substances into cylinders: I was in conversation with a gentleman on the train going from Avonmouth to Bristol, and in talking about relief valves (I might say he told me he was a master mechanic on a railway in South Africa), he said if running engines without relief valves treated him the way one engine had, he hoped they would never come into general use. He had some trouble with an engine's valves, and in taking out the valve he found a groove running lengthwise on seat and valve face, and what was more a pebble, as he thought, about the size of a large pea, embedded in the seat. He took the pebble to have it analyzed, and it was found to be a very fine diamond. As to how that happened to get there it is hard to say, but he puts it down to the engine not having relief valves.

Now, in summing up, we have a few benefits from relief valves if properly applied:

1. They prevent foreign matters from smoke-box being drawn into steam ways.
2. They prevent broken and leaky steam joints or cylinder heads by compressed condensation.
3. They make free-running engines when drifting.
4. They reduce the cost of maintenance on pistons and valves.

Of course, with the good braking appliances now on our engines, the old practice of "plugging" is about eliminated, and the danger of failures from this source is minimized. As there is still though a great deal of it to be

* Read at Canadian Pacific Railway Club, Montreal.

done, it would be advisable to put a stop to it once and for all.

The usefulness of relief valves is greater on a rolling division than on a level section of road, as on the latter steam is in constant use, while on the former "shut-off" and drifting down grades bring out the value of the relief valve.

The automatic relief valve, as applied to many of our engines, gives trouble by stem of valve breaking, and allowing the valve to unseat itself, and also by valve seat becoming defaced. The combined relief and pop valve gives abnormal trouble by steam leaks, especially on high pressure side of compound engines. This is a very serious matter from the fact that in severe cold weather a small leak makes a cloud of steam, and the enginemen are (when slow) running in a fog. This could be avoided in some cases, where space permits, by applying the improved relief valve (described later) which allows the escape steam to go to the atmosphere by way of smoke stack.

The size of relief valves is governed by proportion of cylinder, but in some cases I have seen an 18 in. cylinder with the same size relief valve as a 35 in. cylinder. For my part, I do not think this is right. The latter should be increased two to one. The cost of maintenance of a good relief valve, that can take care of its own escape steam, would be exceedingly small, while the cost of maintenance of the combined pop and relief valve in cold weather is very high, for the reason that in the summer the leaks are not visible. A question came up one day, "Does a cylinder relief valve allow all the water in the cylinder to escape?" The answer was found to be "No, the valve will clear the cylinder of all the water except the quantity due to the clearance between the top and bottom of the cylinder and the cylinder cover, or end, as the case may be." Before going any further I should like to give an account of a small experience I made with relief valves. For a couple of voyages on the S.S. "Montcalm" I had charge of the refrigerating plant, and the engines were equipped with loaded spring relief valves, one on each end of both low and high pressure cylinders. The steam pipe from boiler to engine was about 90 feet long, which caused a fair amount of condensation. Underneath the relief valves I placed small tins to catch the water blown out. In one hour and thirty-seven minutes I had a good quart of water. I then blocked up the relief valves and waited a few minutes until water began to pound in cylinders, and I noticed that the engine was slowing down. I immediately set valves free, and in a very few minutes everything was running ship-shape. The next time we stopped the machine I, on the quiet, had to put in two new studs in the high pressure cylinder head, because I broke two in trying to tighten head up after my little experiment.

So far as I can ascertain, there is no definite rule for giving the proper sizes of relief valves for different sized cylinders, and I think it would be well worth while to carry out some experiments with a view to establishing such a rule —using different sized valves with the same pipe connections to the cylinder. An experiment I have thought of that could be tried with spring loaded valves is: Have a connection or electric contact between the valve and cab, so that when the valve lifts it will ring a bell in the cab. Let someone take very exact notes on every position of lever in cab—more especially of reduction of train line, and air reservoir pressures in bringing the train to a stop—then, if possible, under same conditions (by cooperation of engineer) block the valve so that it will not lift—and take the same notes—at the same time noting the difference in momentum of train while drifting into a station; also take cards off the engine with the relief valves closed, and running free with valves in normal condition.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

FOUNDRY SUPPLIES.—The J. D. Smith Foundry Supply Co., Cleveland, have issued a most complete catalogue of over 250 pages describing practically everything necessary to the modern foundry. It is No. 37 of their publications.

ELECTRIC DRILLS, ETC.—The Chicago Pneumatic Tool Co.'s electrical tool catalogue No. 21 covers electric drills, grinders, drilling stands, etc. It consists of 60 pages, and is said to be one of the most complete ever shown by a single manufacturer. A copy will be furnished on request.

AIR AND GAS COMPRESSORS.—Catalogue H-36 of the Ingersoll-Rand Co., New York, contains 64 pages of well-illustrated information on Ingersoll-Sergeant Class "H" air and gas compressors. Leaflet 6-A concerns Haeseler and Imperial pneumatic tools.

GEAR CUTTERS.—The catalogue issued by the Brooke Tool Manufacturing Co., Birmingham, contains prices of Involute gear cutters in both best cast steel and the company's special high speed steel, arranged side by side for easy comparison. This firm is now making the shallow or stub form of tooth for motor car gears, electric crane gears, and other quick running machinery, which, it is claimed, runs much more smoothly than the usual length of tooth.

STEAM HAMMERS.—The David Bell Engineering Works, Buffalo, in Catalogue No. 806, give a lot of information concerning Bell's Steam Hammers, including general directions for the foundation and setting of the different styles of hammer.

THE J. W. HARRIS COMPANY., Montreal are getting out their new catalogue for 1907, with complete illustrations of the "Harris Excavator," which will be of considerable interest to contractors.

MACHINE TOOLS.—A very complete catalogue of machine tools, including upright drills, gang drills, lathes, tool grinders, etc., has been issued by the B. F. Barnes Co., Rockford, Ill.

BELTING.—A revised price list of Maple Leaf belting has been issued by the Dominion Belting Co., Hamilton. With it is enclosed a list of firms throughout Canada who use this make.

GRINDING WHEELS.—An interesting booklet on the manufacture of "Alundum," used in the making of Norton grinding wheels comes from the Norton Company, Worcester, Mass., and Niagara Falls, N.Y.

THE METRIC SYSTEM.—The Decimal Association, of London, Eng., have issued in pamphlet form Lord Kelvin's views on the advantages of the metric system, together with the opinion of other eminent men, and explanatory and comparative tables.

HYDRANTS AND STEAM SPECIALTIES.—Two pamphlets, Nos. 440 and 425, issued by the Canada Foundry Co., deal respectively with Walker hydrants and steam specialties, the latter including reducing valves, steam traps, injectors, and feed water controllers.

Uniform Boiler Legislation

WHY there is not uniform legislation in Canada in regard to stationary and land boilers is somewhat of a mystery and forms a vexatious problem not only to manufacturers of steam boilers but to users as well. The fact that a boiler can be made in Quebec and used there that will not be accepted in Ontario , and furthermore one acceptable in Ontario might not be allowed in British Columbia shows that the situation needs remedying. The Canadian Manufacturers' Association is taking up the question, but so far nothing has been done. To ascertain the opinion of manufacturers on this subject a letter was written to some of the manufacturers of boilers in Canada, and the opinions given from several representative firms show the unanimity of opinion in this respect. British Columbia is the only province that claims a particular steam boilers' inspection act, which while very stringent is impartial, and subjects all boilers to Government inspection. Some opinions of manufacturers are herewith quoted, followed by some details of the situation in British Columbia.

Some Opinions.

F. S. Keith, Esq., Managing Editor, "Canadian Machinery," 10 Front St. E., Toronto, Ont.

At the present time the Dominion Government has a Marine Boiler Law which governs the manufacture and use of all boilers used in marine work. This means that all marine boilers used in Canada are made to conform to one general law, so that a marine boiler to be used in British Columbia must be the same in practically every particular as the same boiler would be if used in any of the other provinces.

For stationary or land boilers there is no general law, but each province has a law of its own. British Columbia has a law that is similar to the Dominion Marine Act—every boiler used in British Columbia, with the exception of marine boilers, must conform to this law. Alberta, Saskatchewan and Manitoba each have boiler laws different from the other, and less strict than the British Columbia law. Ontario has no special legislation regarding land or stationary boilers. Quebec has a law different from the others, and the other provinces are similarly situated

It would, I think, be very much in the interests of both the users and manufacturers of boilers in Canada if a uniform act were to be enacted that would govern the manufacture of boilers for all the provinces If the Marine Act were adopted both for stationary as well as marine boilers used in Canada, then every boiler used in Canada would be a first-class boiler. The consumer would be assured of getting an article that would be serviceable and safe in use, and manufacturers would be all placed on a plane, so far as quality of boilers is concerned, and would so be able to carry boilers in stock which would be suitable for any part of the country.

As it is now, a boiler that would be suitable for Ontario would not pass British Columbia inspection, and a boiler that would pass Quebec inspection would probably not pass inspection in most of the other provinces.

I am of the opinion that if the Dominion Government would take up with the provinces this question, and arrange, if possible, for a uniform act, it would be a very desirable thing for the country.

Yours truly,
The Waterous Engine Works Co., Ltd.,
C. H. WATEROUS,
Manager.

* * *

In reply to your letter of the 16th inst. re inspection of boilers, would say that in our opinion it would be desirable, from the standpoint of boiler makers, and also that of the user, if some universal inspection legislation could be put through.

We are afraid, however, that it would be very difficult to reconcile various conflicting interests.

Yours truly,
Canada Foundry Co., Limited,
J. J. ASHWORTH,
Sales Manager.

* * *

Canadian Machinery & Manufacturing News, 10 Front St. East, City.

Gentlemen :—

We have before us your favor of the 6th inst. re legislation affecting the inspection of boilers, and in reply beg to say that we are heartily in favor of the universal inspection of boilers for the whole of the Dominion rather than legislation by the separate provinces. British Columbia is the only province to adopt laws regarding the inspection of stationary boilers, and were each province to pass legislation to this end it is not likely that it would be identical, and to manufacturers like ourselves who are shipping boilers to all parts of the Dominion, it would create great confusion trying to keep track of the laws of the various provinces. The remedy to our mind would be a universal inspection by the Dominion Government.

Yours truly,
Polson Iron Works, Limited,
A. H. JEFFRY,
Secretary.

* * *

Dear Sir :—

In answer to your favor of the 6th inst., we most decidedly favor a uniform inspection of boilers throughout the Dominion. We believe that representatives of the different provinces should get together and unite on one standard inspection act and have the same act put in force in every province of the Dominion. The Engine & Boiler Section of the Canadian Manufacturers' Association has taken this matter up and is moving in this direction. It is not necessary for us to point out the difficulties and disadvantages under the present system. We believe most decidedly that one uniform standard should be adopted for all the provinces of the Dominion and anything that you can do to further this will be appreciated by all the manufacturers and users of boilers.

Yours truly,
The Goldie & McCullough Co., Limited.

* * *

A Definite Suggestion.

Re the question of uniform law covering the building and inspection of stationary or land boilers, I think there should be a uniform law over the whole Dominion, and that it should be under Government supervision, and that the law should be made as simple as possible, with as few conditions or allowances to each rule as could possibly be made to have it all very simple and bussinesslike, so that there would be no question of leaving anything to the intelligence or desire of the boiler builders or inspectors, other than the judgment of workmanship. I would suggest that it would be a very good idea to appoint Mr. F. E. Courtice, of our works, Mr. Arthur K. Spotton of Goldie-McCullough, Galt, Mr. John Gerell, Consulting Engineer, Toronto, and Mr. Main of the Polson Iron Works, Toronto, as a committee, with power to seek assistance if necessary, with a view to framing a standard set of rules for stationary boiler building.

Yours very truly,
Collingwood Shipbuilding Co., Limited.
JAMES M. SMITH,
Manager.

Inspection Requirements.

Every boiler built in British Columbia may be inspected during construction.

The maker must furnish the Chief Inspector of Boilers with a copy of the drawings from which such boiler is being built, and such information as will enable him to calculate the safe working pressure. The same drawings and information must also be supplied by the maker of any boiler to be used in British Columbia, no matter where it may be built. Owners of boilers must every year make provision for inspection, and the engineers in charge of such boilers must assist the inspector in his examination, and point out to him any defects they know or believe to exist, under penalty of having their certificate revoked for neglect to comply with this provision of the Act.

Notice by Agents, Importers and Purchasers.

Agents of manufacturers, or importers of boilers, new or second-hand, must send notice to the Chief Inspector of all boilers imported by them, together with the drawings and information mentioned above. The penalty for default is from $100 to $500. Any person purchasing a steam boiler, either new or second-hand, must notify the Chief Inspector of such purchase, giving name of seller, and stating when and where it can be inspected. Any person installing and putting such a boiler into operation without giving such notice is liable to a penalty of from $100 to $500.

Inspection Fee.

For the first inspection of each boiler the minimum inspection fee is from $5 to $40, according to its horse-power. For subsequent yearly inspection the fee is $5 for each boiler up to 25 horse-power. Where the horse-power exceeds that, an additional charge is made of twenty cents for each horse-power up to 50 horse-power; fifteen cents for each of the next twenty-five horse-power; ten cents for each of the next twenty-five; five cents for each of the next fifty, and two and one-half cents for each additional horse-power. Where two boilers belonging to the same plant are made ready for inspection at the same time, a reduction of ten per cent. in the fees for yearly inspections is allowed; where three boilers are made ready the reduction is twenty per cent., and where four or more boilers are made ready the reduction is thirty per cent.

Note.—The legislative enactments and regulations regarding the construction, use and inspection of steam boilers in British Columbia can be obtained from J. Beck, Inspector of Steam Boilers and Machinery, Victoria, B.C.

At The Noon Hour

Wanted—Position as Fireman.

I am a man industrious;
The reason that I'm idle thus
Is just because I cannot find
A job that's suited to my mind
Quite gladly back to work I'd go
If I could find a job, you know,
That really, truly suited me
And with my system would agree.
I'd like to fire some power machine
That operates with gasoline.

No Waste.

"Not an ounce of waste in a ton of coal, in smoke or otherwise," was the way the advertisement read: "Household rights for fifty cents by mail." Fifty cents duly enclosed brought the information, "Burn the coal, can the smoke and eat the ashes," neatly printed on a card.

Growth of Western Cities.

Apropos of the mushroom growth of new towns on the western frontier, a locomotive engineer relates the following:

"One day I was driving my engine across the prairie when suddenly a considerable town loomed up ahead where nothing had showed up the day before.

"'What town's this?' says I to my fireman.

"'Blamed if I know,' says Bill. 'It wasn't here when we went over the road yesterday.'

"Well, I slowed down, and directly we pulled into the station, where over five hundred people were waiting on the platform to see the first train come in.

"The conductor came along up front and says to me:

"'Jim, first we know we'll be running by some important place. Get this town on your list and I'll put a brakeman on the rear platform to watch out for towns that spring up after the train gets by!'"—Minneapolis Journal.

Mike.—"Pat, kin yez tell me what kapes them bricks together?"

Pat.—"Sure, Mike; it's the mortar."

Mike.—"Not by a dom sight; that kapes them apart."—Harper's Weekly.

Ten Things.

There are ten things for which no one has ever yet been sorry.

For doing good to all.
For speaking evil of none.
For hearing before judging.
For thinking before speaking.
For holding an angry tongue.
For being kind to the distressed.
For asking pardon for all errors.
For being patient toward everybody.
For stopping the ears to a tale-bearer.
For disbelieving most of the evil reports.

Crowded Out.

"Johnny, where is your mechanical engine?"

"Pop's got it."

"How about your automatic trip-hammer?"

"Uncle Bill won't let me have it."

"Your Japanese top?"

"Uncle Jim's playing with that."

"Well, you seem to be in the way in the nursery. Guess you'd better go into the library for awhile."—Louisville Courier-Journal.

Bunkoed.

An agent came around to me—
(He said he was a "gent");
To sell to me machinery
He said was his intent.

I bought a forge, asbestos lined,
He said he'd guarantee;
A patent kind he said I'd find
A model forge to be.

Now o'er that forge my spirit grieves.
And weeps my faithful pard—
For he believes it has the heaves.
Because it breathes so hard.

I'd like to meet that cuss, by George.
Who sold that forge to me;
Make him disgorge. It was no forge—
It was a forgery.

—Modern Machinery.

New Intercolonial Shops.

As soon as the snow begins to disappear work on the Intercolonial Railway Co.'s shops at Moncton, N.B., will be pushed with all possible speed. The new buildings will be constructed of cement and steel. Between 600 and 700 men will be engaged at the work during the coming season.

Proposed Changes in the New Tariff.

HON. Mr. Fielding has given notice of about 120 changes in the new tariff schedule brought down in Parliament on November 29th last. No official explanation of the changes will be given until the resolutions are moved in the House. For the most part they are of a technical or relatively unimportant character, designed to meet the objections of manufacturers and others on minor points.

Changes in Iron Duties.

Some important changes are made in the duties in iron and steel. A new item is introduced comprising flat-eye bar blanks, not punched or drilled or rolled; edge plates of steel over twelve inches wide for use in steel structural work or car construction, the preferential tariff being fixed at $2 per ton, the intermediate at $2.75, and the general at $3.

On scrap iron and similar material the British preference has been reduced to 50 cents per ton. The duty on rolled iron or steel beams and other rolled shapes other than railway bars or rails has been fixed at $2 per ton under preferential, $2.75 intermediate, and $3 general. Boiler plate not more than thirty inches wide, wrought seamless tubes for boilers, wire riggings, and steel wire to be used in the manufacture of rope have been placed on the free list.

The changes, as they affect the hardware trade, are as follows:

Item 261 is amended to place spirits of turpentine on the free list instead of dutiable at 5 per cent.

Item 270 provides for a reduction in the general tariff on crude petroleum, gas oils other than naphtha, benzine and gasoline, the duty to be one and a half cents a gallon instead of two and a half cents.

Item 281 is changed to read:—"Fire brick of a class and kind not made in Canada preferential free, others, 5 per cent. each." The present tariff rates are 5, 7½, and 10 per cent.

Item 316A is a new one. It reads:—"Incandescent lamp globes for use in the manufacture of incandescent lamps, and mantle stocking for gas lights, 5, 7½ and 10 per cent."

Duties on Glass.

Item 326 adds to the dutiable articles of glass of all kinds, bottles, lamp chimneys, globes, etc., the words, "blown glass, table and other cut glass ware."

Item 341 change to read:—"Tinware, japanned or not, and all manufactures of tin, n.o.p., 15, 22½ and 25 per cent."

Item 355, which provides for the free importation of Britannia metal and German silver, strikes out the words "or bars" when it applies to the free importation of German silver in bars.

Item 271, on iron or steel scrap, wrought, being waste or refuse, including punchings, cuttings, or clippings of iron or steel plates or sheets having been in actual use; crop ends of tin plate, bars, or of blooms or of rails, the same not having been in actual use, the British preferential has been reduced from seventy to fifty cents.

Item 379 has been changed to read "rolled iron or steel beams, channels, angles and other rolled shapes of iron, steel not punched, drilled or further manufactured than rolled, weighing not less than thirty-five pounds per lineal yard, not being square, flat, oval or round shapes, and not being railway bars or rails, per ton preferential, $2; intermediate, $2.75; general, $3."

Item 379 is a new item, as follows: "Flat eye bar blanks, not punched or drilled, and universal mill or rolled plates of steel over twelve inches wide, for use exclusively in the manufacture of bridges or of steel structural work or of car construction, per ton, preferential, $2; intermediate, $2,75; general, $3."

Boiler Plate Free to Manufacturers.

Item 380 is changed to read as follows:—"Boiler plate of iron or steel, not less than thirty inches in width and not less than a quarter of an inch in thickness, for use exclusively in the manufacture of boilers, under regulations by the Minister of Customs, is made free in all the tariffs."

Item 381 has been changed to read:—"Rolled iron or steel plates, not less than thirty inches in width and not less than ¼ of an inch in thickness, n.o.p., per ton, preferential, $2; intermediate, $2.75; general, $3."

The item formerly was "Plates of 48 inches preferential, 5 per cent.; intermediate, 10 per cent., and general, 10 per cent."

On item 381 "strips, polished or not," have been added after "steel sheets." Preferential, free; intermediate, 5 per cent.; general, 7½ per cent. "Flat galvanized iron or steel sheets" have been struck out.

Item 386 has been made to read:—"Rolled iron or steel and cast steel, in bars, bands, hoops, scroll, strip, sheet or plate, of any size, thickness or width, galvanized or coated with any material or not, and steel blanks for the manufacture of milling cutters, when of greater value than 3½ cents per pound: preferential, free; intermediate and general, 5 per cent. each."

Item 387 is a new one, and reads:—"Steel in bars or sheets, to be used exclusively in the manufacture of shovels, when imported by manufacturers of shovels: preferential, 10 per cent.; intermediate, 12½ per cent.; general, 15 per cent."

Item 395—Wrought or seamless iron or steel tubes for boilers n.o.p., under regulations prescribed by Minister of Customs, flues and corrugated tubes for marine boilers, are made free in all three tariffs. It was: Preferential, free; intermediate and general, 5 per cent. each.

Item 397—Tubes of rolled iron or steel not joined or welded, not more than 1' inches in diameter, n.o.p., have been made free in all tariffs.

Increase on Coil Chain.

Item 410—Coil chain, coil chain links and chain shackles of iron or steel five-sixteenths of an inch in diameter and over; Preferential, 5 per cent. as at present; intermediate, increased from 5 per cent. to 7½ per cent., and general from 5 per cent. to 10 per cent.

Item 411—Malleable sprocket or link belting chain is made free in all the tariffs. It was 15 per cent., intermediate 17½, and general 20 per cent.

Item 451A is new. "Stoves, urns of metal and dove tails, chaplets and hinge tubes of tin for use in the manufacture of stoves, preferential 5 per cent., intermediate 7½ per cent., general 10 per cent."

Item 460—after the words "processes in" the words "iron or copper" are struck out and the word "metals" inserted instead.

Item 461A is new. "Iron or steel pipes, not butt or lap welded, and wire-bound wooden pipe not less than 30 inches internal diameter, when for use exclusively in alluvial gold-mining, preferential 5 per cent., intermediate 7½ per cent., general 10 per cent.

Item 462, which formerly included only "blast furnace slag trucks," is amended to include blowers of steel of a class or kind not made in Canada, for use in the smelting of ores or in the reduction, separation or refining of metals, rotary kilns, revolving roasters and furnaces, of metals of a class or kind not made in Canada, designed for roasting ore, mineral, rock or clay, blast furnace, slag trucks and slag pots of a kind not made in Canada, made free in all tariffs.

Item 524A is new. Seamless cotton or linen duck, in circular form of a class or kind not made in Canada, for use in the manufacture of hose pipe, made free in all tariffs.

Item 682—After the words Manila rope insert "not exceeding 1½ inches in circumference"; before the words "fishing nets" strike out the words "deep sea."

Drawback Increased to 99 Per Cent.

Schedule "B" covering goods subject to drawback for home consumption is amended so as to make the portion of duty (not including special or dumping duty) payable as drawback, 99 per cent. instead of 95 per cent.

Item 1,002 in this schedule is changed to read: "Malleable iron castings and pig iron," instead of "rolled iron, rolled steel and pig iron."

In item 1,009 all the words after augur bits are struck out, and bit braces is added to the othem items in which drawback is payable.

The following items are also added to schedule "B" as subject to payment of drawbacks:

1,011—Nickel, nickel silver and German silver in bars, rods, strips, sheets and plates, when used in the manufacture of spoons and cutlery, a drawback of 65 per cent.

Item 1,015—Rolled angles of iron or steel, nine and ten gauge, not over one and a half inches wide, and used in the manufacture of bedsteads, are subject to a drawback of 99 per cent.

Item 1,017—Lap-welded tubing of iron or steel, not less than two and a half inches diameter, threaded and coupled or not, testing 1,000 pounds pressure to the square inch, when used in oil or natural gas wells, and for transmission of natural gas under high pressure from gas wells to points of distribution, drawback 99 per cent.

Item 1,018—Machinery imported prior to July 1st, 1908, and other articles not machinery, when entering into the cost of tin plate manufactured in Canada, drawback 99 per cent.

Item 1,019—Bituminous coal, when imported by proprietors of smelting works and converted at the works into coke for the smelting of metals from ores, drawback 99 per cent.

Milling Machine Attachments.

THE UNIVERSAL SPIRAL HEAD. By John Edgar

THE calculation of gears for this kind of work, whether on the lathe or milling machine, has always been a source of trouble for the average machinist. It is the intention here to give just such simple rules as can be easily remembered and referred to in case they are forgotten.

It has been explained in the former article that the worm gear on the spindle has forty teeth and that the worm is single threaded so that the ratio of worm shaft to spindle is 40 to 1, and it will require forty turns of the worm shaft to cause the spindle to make one complete revolution. The lead screw of the universal milling machine has four threads per inch, or it is one-quarter of an inch pitch, and will move the table one-quarter of an inch for every turn. If the worm shaft of the head and the screw of the machine are so geared together that they revolve at the same speed it will require forty turns of the screw to revolve the spindle one revolution. Turning the screw forty turns will move the table along lengthwise ten inches, and when geared so, the spiral that would be traced has a lead of 10 inches. This is known as the "lead of the machine." This lead of the machine is a constant quantity with all standard heads and milling machines and forms a basis on which to make our calculations for the gear ratio necessary to cut a given spiral. Thus, if we have a lead of eight inches to cut, we proceed as follows. The machine, when set with even gears, cuts a 10-inch lead, therefore the ratio of the driver to the driven must be as 10 is to 8 in order that the 8-inch lead may be obtained, or we may reason thus: In moving the table lengthwise eight inches, the screw must turn $8 \times 4 = 32$ turns, and in order to obtain one complete revolution of the head spindle the worm shaft must turn 40 revolutions, therefore the ratio of turns of worm shaft to those of the screw is as 40 is to 32. And a 40-tooth gear may be used on the screw and a 32-tooth gear on the worm shaft. If we have no such gears or only one of them in the set, we must multiply each term by the same number until we have a pair of numbers which correspond to numbers of teeth in two of the set of change gears. When two gears can be used as figured above they may be brought into connection by either one or two idle gears according to the "hand" of the spiral to be cut. This arrangement is known as simple gearing and can be used in low pitches which do not differ from 10 inches by a very large amount. The above may be placed in the form of a rule which will be much easier to apply and also to refer to.

Rule for finding gears for spiral cutting, (simple gearing).

$$\frac{\text{Lead of machine}}{\text{Lead to be cut}} = \frac{\text{Driving gear}}{\text{Driven gear.}}$$

Where the lead of the machine is 10 we have,

$$\frac{10}{\text{Lead to be cut}} = \frac{\text{Driving gear}}{\text{Driven gear.}}$$

Our last example expressed as above is,

$$\frac{10}{8} = \frac{40}{32}$$

Here we see that the first number has been multiplied by 4 to obtain the last, which is the process in finding any ratio required. Thus let it be required to cut a lead of 16 inches,

$$\frac{10}{16} = \frac{20}{32} = \frac{40}{64} = \frac{60}{96} = \text{or } \frac{30}{48} \text{ here we have used}$$

as common multipliers 2, 4, 6 and 3, respectively, showing the different combinations that can be used. This could be carried on indefinitely.

When the difference between the required lead and that of the machine is great, the case becomes more complicated and compounding of the gears will be necessary to obtain the desired ratio. The rule for this case is,

$$\frac{\text{Lead of machine}}{\text{Lead to be cut}} = \frac{\text{Driving gears}}{\text{Driven gears.}}$$

Let it be required to cut a lead of 45 inches. Applying the latter rule we have,

$$\frac{10}{45} = \frac{\text{driving gears}}{\text{driven gears}} = \frac{2}{5} \times \frac{5}{9} = \frac{24}{60} \times \frac{30}{54}$$

Here we find that we cannot use simple gearing, because in order to have the small gear of a reasonable diameter the large gear would be of such large proportions that it would be impossible to have them mesh on the short centre distance of the two shafts. So we compound the gearing. The best method of going about the problem of choosing the necessary gears is to break up the fraction in the first number, in this case $\frac{10}{450}$ so as to obtain two fractions whose product will equal the original. Thus in the example, we have factored the numerator into its two even factors 2 and 5, and the denominator into its factors 5 and 9. By multiplying the terms of each fraction by a common multiplier we arrive at fractions which, while they are not altered in value, give numbers which equal the number of teeth in the gears that can be used. In the above example we have multiplied the terms of the first fraction $\frac{2}{5}$ by the common multipliers 12 and obtained 24 and 60 as the possible gears, and the second fraction by 6 and obtained for gears 30 and 54 teeth. The driver gears are always the "second gear on stud" and the "gear on the worm," and the driving gears the "gear on screw" and the "second gear on stud."

Where accuracy is not important and where the lead has no real significance, as in milling cutters, twist drills, etc., where the diameter is small and the pitch or lead long, an error of one or two per cent. is allowable.

In setting the milling machine table when about to mill spiral work it is necessary to know what the angle of the spiral is with the axis. This angle can be found by laying out a triangle, having as its short legs the circumference of the work and the lead of the spiral, and the angle the long leg makes with the leg representing the lead is the angle of the spiral with the axis. Such a triangle is shown in Fig. C, (a-c-b). In the figure is shown a cylinder upon which is wrapped this triangle showing the spiral path (a-e-c) followed by the cutter when cutting the lead which the machine is geared to cut. The angle of the spiral can also be found by trigonometry by the following rule:

Rule of finding angle of spiral with axis.

$$\frac{\text{circumference}}{\text{lead of spiral}} = \text{tangent of angle.}$$

The angle may be found from any table of trigonometrical functions.

Sometimes it is desired to find the lead of spiral corresponding to a given angle by changing the rule to accommodate this case we have,

$$\text{lead of spiral} = \frac{\text{circumference}}{\text{tangent of angle.}}$$

Or we may by constructing a triangle beginning at the point (a) in Fig. C, laying out the two sides which meet at this point and diverging by the angle which is obtained by subtracting the angle of spiral with the axis from 90, making the line representing the circumference equal to that quantity; and at the point (b), and at right angles to the circumference line (ab), draw the line (bc) and you have the lead of spiral in this line whose length is (bc).

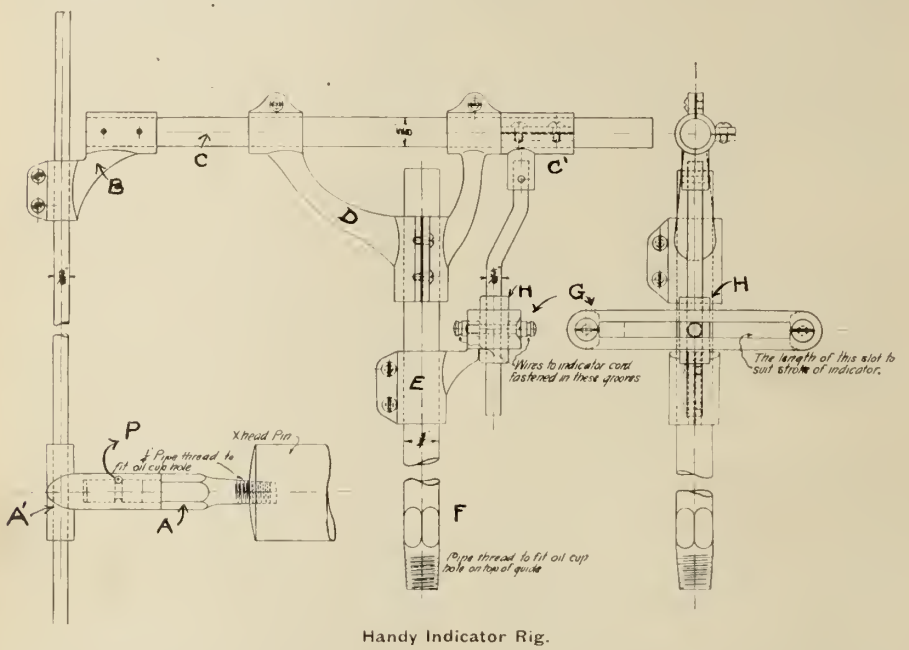
Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

HANDY INDICATOR RIG.

By F. C. D. W., Brantford.

HEREWITH is a drawing of a very handy indicator rig which I thought might be of interest to your readers; possibly solve the question for some one who, perhaps, has been looking for some such rig. One of its strongest claims for recognition is the fact that when taken apart it fills very little space, thus being convenient for the itinerant engineer. Another claim is the facility with which it can be "lined up" and adjusted to suit the stroke, etc., of the engine to be indicated.



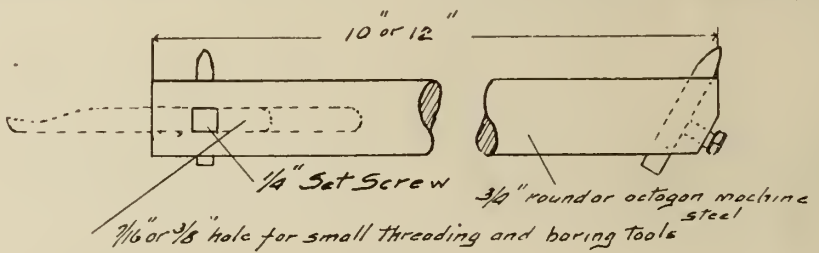
Handy Indicator Rig.

Mr. G. Pickles, foreman of the engine department of the Waterous Engine Works Co., Brantford, is responsible for the design, and to him I am indebted for the sketches from which I have made my drawing. The castings are all of brass and the rods are of cold rolled steel. The standard is threaded to fit the hole tapped for the grease cup, which is generally in the centre of the guide and the motion is taken from the crosshead pin in the manner shown.

A HANDY TOOL.

By James C. Moore, Toronto.

A VERY handy tool I have had in almost constant use while at small lathe work I made from a piece of chisel steel ¾ octagon by ten inches long. I drilled a 7-16 hole in 6 inches on one side to hold very small boring and threading tools. On same side I made a square hole to receive ¼ tool stand ⅜ from end and held fast by same ¼ set screw as holds round steel, so it can be used as a larger boring tool. On the other end I have it angled off to receive ¼ tool pieces to go up to a corner, as can be seen by sketch. This octagon steel is preferred to round steel as it can be readily used in same position for the square bars and can be packed up to any desired height in tool post much easier.



A Handy Tool.

SHOP ETHICS.

Where the Dignity of Labor Comes in.

By C. J. Stuart, Montreal.

IN these modern days when we are accustomed to hear so much about "the dignity of labor," it should be frankly stated that there is no dignity whatever in being driven or rushed about the work in question. To be alert and a quick worker is all right, but no one can truthfully say that either the justifiable speeding up of a "shirker," or the equally undignified sight of a good man being hustled by an ignorant or selfish slave driver, is in any way edifying to behold.

Perhaps the fact is that this phrase has something of the Eastern figurative exaggeration, like "the camel that never tires." The laborer originally intended—a workman who glories in his work—is far removed from our commonplace idea of labor. Be it also understood that office men and "intellectuals" are within the terms of our text as much as the field reapers, the hammer-and-tongs men, and others raising a dust by the sweat of their brow.

The dignity of labor is the dignity of excellence—the dignity of a man who knows he is doing his honest best; or the dignity of a good man justly proud of good work. It is the **good work** that dignifies the laborer—not the pose; nor his little ticket of membership; nor the job.

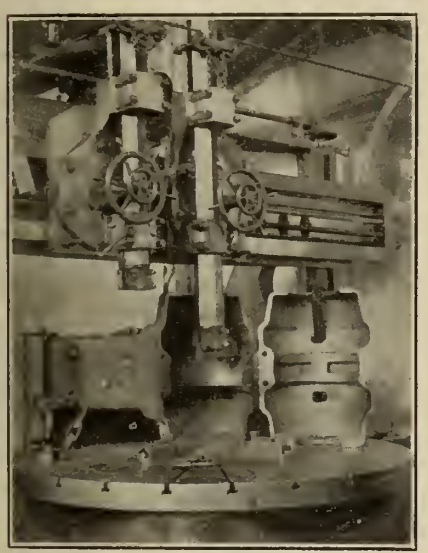
UNUSUAL BORING OPERATION.

By G. R. Lang.

WE are sending you under separate cover a photograph of, we believe, an unusual operation for the boring mill. The out board bearing or pedestal shown was too large for any of our horizontal boring bars, which we had fitted with special heads, for boring out spherical bearings, so we rigged up the vertical mill as shown. The left hand head and ram were locked stationary, the right hand cross head was left free to move at will on the cross rail. The ram of this head, which did the cutting, was connected to the left hand stationary ram with a link as shown. The distance between the pivot holes in this link are the same as the radius of the bore. The rams were ad-

justed to height, so as to bring this link in a horizontal position when the cutting tool was half way through the bore. When the cut is started, the link, ram and tool are in the position as shown, the vertical feed is applied to the ram, and as it feeds downward it describes a circular motion. The tendency during the first half is to bring all the lost motion to the one side; after the tool passes the centre, however, the link is pulling, instead of pushing, the ram, which causes the slack in the parts to shift in the other direction. This causes a little irregularity in the outline of the bore.

To avoid this, on the finishing cuts the tool is run to the centre of the cut the machine is stopped, the pin which holds the connecting link to the ram is removed, the tool run to the bottom of the cut, by hand, the pin again inserted and the cut run from the bottom up to



Unusual Boring Operation

the centre. With a little care almost a perfect sphere is produced. An 18-inch pin gauge started at the two diagonal corners was turned through with only a variation of .003 inches at any point. The bushing or bearing for this pedestal was also cored and turned on the mill, using the same connecting link, the tool, of course, being on the outside of the work instead of inside. A great many of these pedestals have been done in this way, the average time being about five hours each. This, however, was due to the good facilities of this shop for quickly and securely chucking their large work. As will be noticed in the illustration, turn-buckles are used for drivers, and T-bolt heads and studs are used instead of belts for clamping the work to the table.

We would mention in connection with the job just described that it is necessary to set the tool so that the cutting point is central with the boring mill table, measured in a horizontal line from the face of the cross rail; if it is not, the tool will cut a radius larger than that described by the moving pin.

GRINDING CRANK PIN.

By N. C. Johnson, Owen Sound.

WHEN grinding a crank pin in an engine disc, by hand, throw the crank disc to position "A" and grind firmly for a few minutes until the emery has found a true bearing with the pin.

Throw the crank disc to position "B" and repeat as in "A."

Throw to "C" and "D" and do same.

This is an improvement on the old way of grinding a pin with the crank in one position, and it keeps the pin from wearing the lower side of the hole by excessive grinding with emery.

My experience in both cases, gives a better result by throwing the crank than by leaving it in one position, and also saves time, making a truer job.—N. C. JOHNSON.

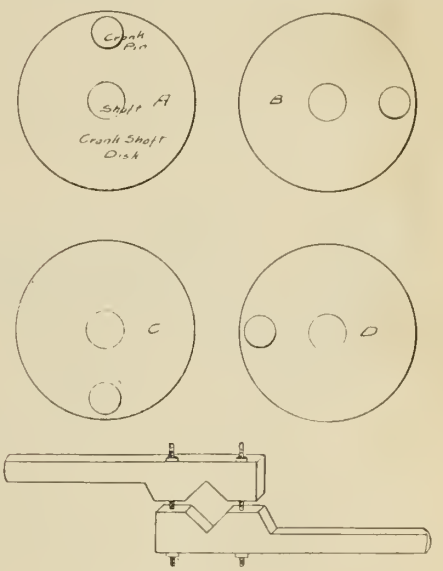
BANQUET AND PRESENTATION.

On the occasion of his leaving to become manager of the western interests of the Canadian Westinghouse Co., as mentioned in last issue, Mr. Archibald W. Duff, of Montreal, was the recipient of an appreciation on Saturday, Feb. 2nd, from business associates and personal friends to the number of over sixty, in the form of a banquet held at the Canada Club. The chair was occupied by Mr. Edgar McDougall, president of the Allis-Chalmers-Bullock Co. Mr. Claud Hickson presented Mr. Duff with a gold watch, suitably inscribed, as a token from his Montreal friends. The present was brought in a large box, which, on being opened, was found to contain a very small-sized colored boy, who held the watch in his hand, and duly handed it to Mr. Duff, much to the amusement of those present.

WINS THE GZOWSKI MEDAL.

At the annual meeting of the Canadian Society of Civil Engineers recently held in Montreal, the Gzowski gold medal for 1906 was awarded to Mr. Walter J. Francis, C.E. (Tor. Univ.) M. Can. Soc. C.E., M. Am. Soc. E., of the Dominion Engineering and Construction Company, Limited, Montreal.

The Gzowski gold medal is awarded annually by the Canadian Society of Civil Engineers for the best paper read before the society during the preceding twelve months, and the medal for 1906 was won by Mr. Francis for his masterly paper on "Mechanical Lift Locks in Canada." The paper deals with the construction of the famous hydraulic lift locks on the Trent Canal at Peterborough, Ont., in the building of which Mr. Francis played a most prominent part, not only in the actual construction work, but also in the designing and planning of the scheme. The building of the hydraulic lift locks at Kirkfield, Ont., is also dealt with, and the paper is not only valuable from an engineering and scientific standpoint, but is also of great interest to the lay reader, giving as it does many interesting details concerning one of the most notable engineering feats accomplished in Canada in recent years, and showing the possi-



Grinding Crank Pin.

bilities of concrete for hydraulic and general construction work.

The Gzowski Medal Fund was established in 1892 by Colonel Sir Casimir S. Gzowski, when he retired from the presidency of the Canadian Society of Civil Engineers, and is controlled by the governing body of that society, the medal only being awarded in the event of papers of sufficient merit being submitted during the year, and the medal now being made for presentation to Mr. Francis is the fourteenth which has been awarded since the institution of the fund.

Mr. Francis, although a Torontonian by birth, is a Montrealer by adoption, and is now assistant manager and chief engineer for the Dominion Engineering and Construction Company of Montreal, and as such has sole charge of all their engineering and construction work.

Mechanical Reviews

OPINIONS AND STUDIES WORTH NOTING

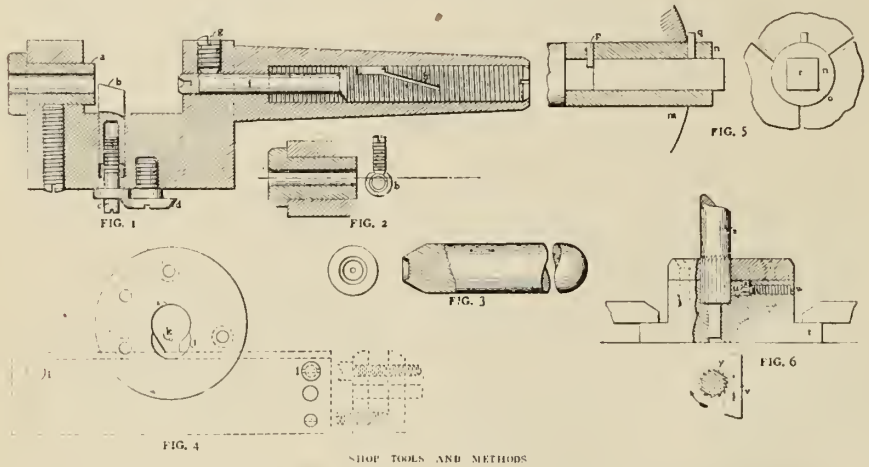
SHOP TOOLS AND METHODS.

FIG. 1 shows a box tool, used in this case in the bench-lathe tail-stock. The bushing **a**, of which different sizes can be used in the same box, is made to fit any size wire required. Fig. 2 shows an end view of the cutting tool **b** in its relation to the bushing; it is held by a set screw on the flattened top.

Provision for Adjusting the Box Tool.

The tool is adjusted to the cut by the screw **c**, Fig. 1, which screw has a flange coming between the head of screw **d** and the body **e**, thus allowing it to act as a regular feed screw.

The stop or end-adjustment screw **f** can be held with screw **g**; or by slitting and expanding as shown at **h**. This latter scheme gives a fine tension.



The body **e** is of mild steel about ⅜x1½ inches, centered and turned to shape and milled across for the opening.

Punch for Face-Plate Work.

I carry in stock a number of circular punches, like Fig. 3, mostly for transfer work on the drill press. Incidentally I use them for locating work on a face plate where it is required to remove stock at the side of a hole already made. A job of this kind is shown in Fig. 4, which represents a round die. I bore out and finish the round part **i** of the die, then to save the filing the irregular part clear through, I turn out the part of circle **j** at the back of the die. I locate the centre **k** when laying the die out, and, finding this with the pump centre of the bench lathe, bore out the back clearance **j** the first thing.

How the Punch is Used.

Using the parellel bars, shown by dotted lines, to transfer the irregular form of the die from the face to the back, I hold the punch, Fig. 2, against the work and mark around it, moving it to suit me, and then strike it with the hammer for an impression. Then I catch the punch in a chuck which fits the tail-stock spindle of the lathe, and use it to locate the work by the stamped mark until the clamps are secured on the face plate.

This is only an off-hand way to get an approximation to the true shape without plugging the hole **i** and finding a centre **k** for circle **j**.

Transferring Lines.

I sometimes get an opposite parallel line by holding the work in a small Vanderbeek or other drill vise, resting it on the surface plate and transferring from front to back with the surface gauge.

Again I put small pieces in a Billings & Spencer vise which has parallel jaws. line the work in front with the front jaw, and use the back jaw as a straight edge to get a line opposite the first on the back of the piece.

A Pair of Filing Bars.

The parallel bars shown by the dotted lines in Fig. 4 have been used for years on work, when I wished to file through a die quickly to line. They are of mild steel with beveled edges, which are tinted with blue stone and replaned or milled, as needed. The screws **l** clamp the work and the other screws place the bars parallel with it, while the dowel pins keep the edges of the bars parallel.

Adapter for Square Stock.

Fig. 5 illustrates an adapter for square stock to be held in a spring chuck **m**. A piece of round stock **n** is bored centrally and filed out square to right size and split at **o** for closing on the work. The pin **p** gauges the work in the adapter and the pin **q** gauges the latter in the chuck. In this way the work **r** can be readily duplicated as to length.

Milling Small Stock.

Fig. 6 shows a slabbing device for sizing square stock such as that held in the adapter in Fig. 5.

The milling cutter **s** may be held in a drill press and the guide block **t** fastened to the table. The stock is then pushed through the opening, as seen at **u**, and against the cutter as at **v**.

The screws **w** hold the gib **x** which gauges the thickness to which the stock is cut, and the face of the guide block in the rear of the cutter should correspond to the milled face of the work at **y**.

CAMS vs. ECCENTRICS FOR GAS-ENGINE VALVE GEAR — THE TWO-STROKE CYCLE CHAMPIONED.

FOR the sake of helping to attain perfection in gas-engine design, I am taking the liberty to give my opinion on a small portion of the said article. In Fig. 105 (reproduced herewith as Fig. 1), a drawing is given showing the Klein arrangement of valve-operating mechanism for the inlet valve. I will admit this is extremely ingenious in design, but I cannot agree with the writer that it forms a cheaper construction than the old cam arrangement. Unfortunately, an eccentric is not adapted to causing a quick motion at the end of its stroke without resorting to some sort of cam arrangement between it and the valve stem; then why not use the cam arrangement directly instead of with an

eccentric? The half speed of the eccentric would seem to present difficulties in the way of properly adjusting and timing at each end of the eccentric stroke, and the cheaper construction is certainly that of the cam arrangement.

The accompanying sketch, Fig. 2, will serve to show the simplicity and cheap construction of a pure cam motion, and while there is one pivoted joint more on the cam design than on the eccentric shown, it is a cheap form of joint, and if a slide was substituted for the joints 3 and 4 the two joints would be done away with.

In addition to the joints mentioned there is the double-cam lever which the roller rides on, and which is more than equal to the cost of making a cam, as the latter is an extremely cheap part to manufacture, with tools arranged for the purpose. Then there is the addition of the eccentric to make, which represents about the excess of cost of the Klein arrangement over the old-style cam device. This is not intended as a criticism of design, but to show that users of the direct cam arrangement can offer a cheaper construction and one with as long life as the eccentric style for two-stroke-cycle engines.

In reference to the undecided advantages of the two- and four-stroke cycles over each other, there appears to be a growing appreciation of the large two-stroke-cycle engine, which type should have the support of engineers and designers more than it has had. The future will, no doubt, witness a great many two-cycle installations. It would seem also that an ideal design would be a double cylinder vertical with the lower end of the cylinders used for compressing the charge, instead of exploding the charge at both ends for the sake of accessibility and cheapness of construction, the only difficulty being in the successful cooling of the piston.—L. J. MONAHAN, in Power.

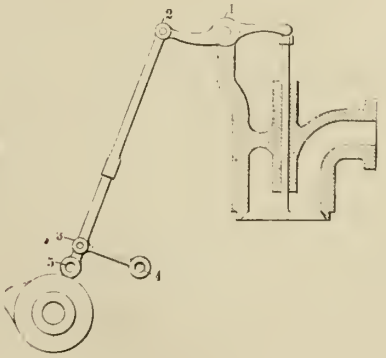

FIG. 2 SHOWING SIMPLE CONSTRUCTION OF A PURE CAM MOTION

MAKING A PATTERN FOR A SPUR-WHEEL BLANK.

THE following is a quick way of making a pattern for a spur-wheel blank or fly-wheel. We will take for example a wheel 44½ in. outside diameter, 40 in. inside diameter, 4½ in. face, six arms ⅞ in. thick, feathers and boss as shown at Fig. 1.

First get out three pieces for the arms, 45 in. long, planed to 7 in. in width and ⅞ in. in thickness, and lock them together as shown by dotted lines in Fig. 2. Set out on them the outside diameter width of arms and radii as Fig. 2. Take them apart to the bandsaw and pare away the surplus stuff of the arms at B, Fig. 2. Roughly bandsaw out the segments, leaving ¼ in. for turning off on the wood-turning lathe. Lay the arms on a true table; then trim, glue, and screw to the arms the first layer of the segments Fig. 1. and A Fig. 2.

Turn the pattern over, and trim, glue, and screw the intermediate segments. Strike on them the line D, and finish off by paring away the surplus stuff. It is now straightforward work to complete the building up of the rim, taking care to sink the outside screws to avoid turning off the heads in the lathe.

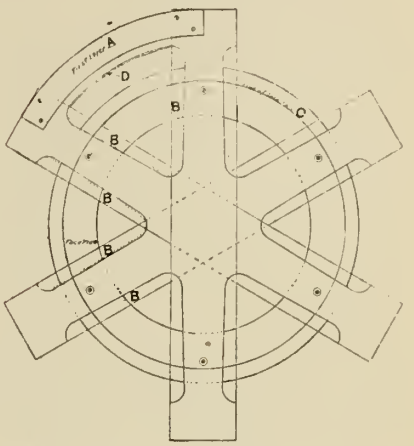
While the glue is drying, turn up the bosses and prepare the feathers or ribs, fitting them up to the bosses

If there is not a faceplate (a wooden one) in the shop, we must knock up one—anything between 30 and 38 in. in diameter being a suitable size for this particular job, though of course it will come in for a hundred other jobs. Glue up, say 3 pieces 33 by 11 by 11½ in., and bandsaw to the largest diameter they will hold up to.

Glue and screw well an 11 by 1½ in. batten right across the middle of the back, and screw or bolt on the iron faceplate. Rather than turn up the face of plate right across the true, it is better practice to screw on a ring of segments 4 or 5 in. wide, as in Fig. 3. At any future time this narrow face can be re-trued up in a few minutes, and when worn out can be replaced by a new one, thus saving the body of plate from being constantly turned down and becoming useless.

Having faced up the ring on the faceplate, mark on it a circle of say, 30 in. diameter, and also mark on both sides of the arms of the pattern a corresponding circle C, Fig. 2, and scribe up marks with a square on the edges of the arms.

PATTERN FOR A SPUR-WHEEL BLANK. FIG. 1.



PATTERN FOR A SPUR-WHEEL BLANK.—FIG. 2.

PATTERN FOR A SPUR-WHEEL BLANK.—FIG. 3.

Now screw the pattern by six stout screws with washers under the heads, through the arms, on to the faceplate, taking great care that the scriber marks on the arms exactly cover the 30in. circle on the faceplate. Having turned up the outside face and one side, turn the inside of the rim down to a sharp corner on the arm, allowing a full 3-16 in. for taper (B, Fig. 3). Take out the screws, reverse the pattern, and complete the turning of the other side.

Glue in a ½ in. leather fillet at B, Fig. 3, and at B, Fig. 1. This fillet is very handy to take out if at any time the inside diameter of the wheel is required to be made smaller, by laying in pieces all round and re-gluing in the leather; or, to be made larger, by paring out.

All that now remains to be done is to screw on the bosses, fit in the feathers and pare them out to A, Fig. 1. Slightly round the edges and brad in place.

It is as well to make an extra feather for the moulder to mend up with if needed, to save pulling one off the pattern. Screw on the print rather than peg it on, so that the boss can be turned down and used for another job. The Mechanical World.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

HEAVY STAMPINGS TO REPLACE CASTINGS.

STEEL STAMPINGS have recently begun to displace iron, brass, malleable and steel castings for a number of uses. The accompanying illustrations, Figs, 1 and 2, show two large stampings of heavy material, and Fig. 3 shows the punch press designed for producing these stampings. The tool is built by the Toledo Machine & Tool Co., Toledo.

Fig. 1 is a stamping from ¼-inch steel plate. The blank required was 20 inches diameter. The stamping is formed and the centre cut and flanged in two operations. The outer flange is 2½ inches high and the inner flange 1 inch high.

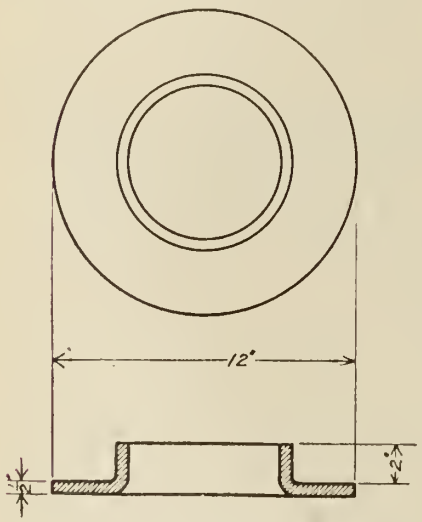


FIG. 2.—STAMPING MADE ON TOLEDO PRESS.

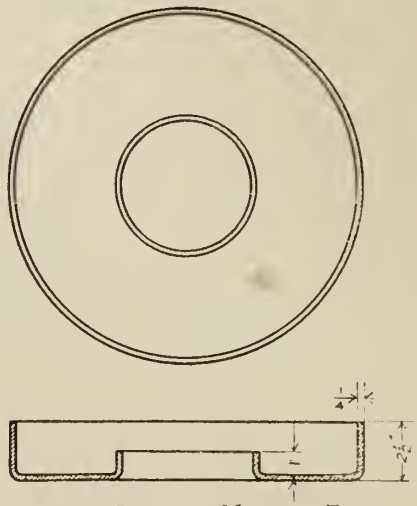

FIG. 1.—STAMPING MADE ON TOLEDO PRESS.

Fig. 2 was stamped from ½-inch plate, and required a blank 12 inches diameter. The centre opening was punched and flanged in three operations, the flange being two inches high, as shown.

The press which did this work was built for the Crosby Co., Buffalo, which makes a specialty of producing stampings of this character for a wide range of work. The press has a capacity of 12,000 tons pressure. It is of massive proportions, as may be judged from the size of the man standing alongside. The ram is operated by a single pitman driven through a train of spur gears and a jaw clutch. The frame is of east iron, is made in one piece and weighs 42,800 pounds. The distance from the bed to the slide with adjustment up is 31 inches. The stroke is 14 inches, while the adjustment of the slide is six inches. The crank shaft at the bearing is 13½ inches in diameter. The gearing is massive and powerful, the main driving gear being 92 inches diameter by 14 inches face. Its weight is 9,000 pounds. The proportion of the gearing is 40.1. The press is provided with a fly wheel 60 inches in diameter and weighing 2,400 pounds. The distance from the floor to the top of the large gear is 14 feet 8 inches, and the bed is 37 inches square. The total weight of the machine is 100,000 pounds.

USES OF ALUMINUM.

THE United States produces more aluminum than any other country in the world, according to the metalurgical experts at Washington, and it is likely to be the first nation to employ the metal in its coinage. Next fall, it is reported, the Director of the Mint will experiment with aluminum coins as substitutes for the bronze one cent piece at present in use.

Only a few years ago considerations of expense would have forbidden any such action. In 1885 a pound of the metal cost $200. So late as 1889 it sold for $4.50 a pound. Now it is quite within the probabilities that in another year it will be profitably produced for 35 cents a pound.

Nature has been lavish enough in this instance, but man is slow to learn her secret. In its various compounds—and it enters into composition of a very large number of minerals—aluminum forms about one-twelfth of the crust of the earth.

Ordinarily it is extracted from the oxide alumina, which is the chief constituent of common clay. Until a few years ago, however, only expensive processes have served to separate the metal from the combinations of which it is found.

During the last decade American scientists and inventors have overcome many of the old obstacles. The first article ever made of the metal was in compliment to Louis Napoleon who had helped St. Clair Neville, the first manufacturer—a table for the baby prince imperial. At present it seems impossible to name a use to which the metal may not be put.

Aluminum is lighter than glass, and only one-fourth as heavy as silver, which it somewhat resembles. Though it is as hard as zinc, scarcely any metal is equally malleable and ductile. It can be drawn into the finest wire and hammered into the thinnest sheets.

If sold at a low price aluminum, which does not tarnish, will largely supplant silver for decorating purposes. It is an excellent conductor and might take the place of copper in electric plants. Since no metal save steel of the highest grade is, weight for weight, its equal in strength, it would compete with the former in almost every manufacturing industry.

France and Germany and the United States have built torpedo boats of aluminum, finding that its lightness insures speed, and that it resists corrosion and galvanic action better than any other metal. Yachts, rowboats, bicycles, motorcars, surgical instruments, skates and cooking utensils have already been made from it.

PERSONAL MENTION

Mr. H. A. McEwen of Carleton Place, has bought the machinery in the Chatsworth Foundry, and is negotiating for the purchase of the property.

Mr. J. W. Harris, head of the J. W. Harris Co., Montreal, was in New York recently. He leaves shortly for Winnipeg and other western points.

Mr. Ford Watson of the Sheldon Co., Galt, Ont., has been spending the past eight weeks in Sussex, installing a shaving exhaust system for the Sussex Mfg. Co.

Mr. K. J. C. Zinck, late of the Algoma Central Railway, has accepted a position in the railway supply department of the Canadian Fairbanks Co., at Montreal.

Mr. A. P. Horsman, manager of the Gurney Standard Metal Company, of Calgary, Alta., was in Toronto during the past month conferring with the head office officials.

Mr. A. Merner, formerly manager of the Waterloo Manufacturing Co., has purchased the Alliston foundry, which has been closed for some years. A new company is being formed.

Mr. Edgar G. Powell, of J. W. Harris Co., Montreal, was in Winnipeg at the beginning of the month on business for the firm. He called at the Winnipeg office of Canadian Machinery on Feb. 4.

Mr. F. Hammar, of the firm of Schuchardt & Schutte, New York, visited Montreal at the beginning of February and was introduced to the trade by Mr. J. J. Sophus, Montreal representative of the firm.

On leaving the employ of the Vulcan Iron Works, Winnipeg, to accept a position with Kelly Bros. & Mitchell, Mr. George Duross was presented by the Vulcan employes with an address and handsome Morris chair.

Mr. Wm. Hall, of the Hall Engineering Works, Montreal, has returned from a trip through the large manufacturing centres of Great Britain, and reports several new agencies, as well as great prosperity everywhere.

Mr. W. A. Kenning has resigned his position as sales manager of the Miller-Morse Hardware Co., Winnipeg, and has been succeeded by Mr. Louis J. Blackwood, who was formerly with Merrick, Anderson & Co.

Mr. Harry A. Norton, vice-president of the Norton Jack Co., of Boston, was a recent caller at the Montreal office of Canadian Machinery. Mr. Norton has just returned from a trip through India, Egypt, and the Holy Land.

Mr. Gordon McKeag, of Winnipeg, formerly of Fergus, has been appointed manager of the Anchor Wire Fence Company of that city. Mr. McKeag has represented this firm on the road for the past seven years, and is deserving of promotion.

Mr. A. W. McConnachie, one of the directors of the Chicago Pneumatic Tool Co., was a visitor at the office of Canadian Machinery recently. He reports enormously increasing trade both in Great Britain and Canada.

The Angola Furnace Co., of Angola, Ind., is moving to Decatur. The company has been reorganized and the new firm will be under the general management of Mr. James Doherty, , formerly secretary and treasurer of the Doherty Mfg. Co., Sarnia.

Messrs. H. G. Eadie and H. P. Douglas, of Montreal, have formed a partnership under the name of Eadie & Douglas, to carry on an extensive building and contracting business. Mr. Douglas was formerly with the Canadian White Co., and he and his partner will make a strong business team.

Mr. W. A. Hastings, of Hamilton, was in Montreal attending the meeting of heads of departments in the various branches of the Canadian Iron and Foundry Co. The 25 representatives present were afterwards banquetted by the president, Mr. Edgar McDougall, and vice-president, Mr. T. J. Drummond.

Mr. J. F. Maegregor, for eight years treasurer of the Galt Machine Works Benefit Society, recently resigned the position. He has been succeeded by Mr. George Grover. On February 8th Mr. Maegregor was presented with a bronze statute and an address by the members of the society in recognition of his services.

Sir Benjamin Baker, the eminent engineer of the Forth bridge ; Sir Wm. White, past president of the Institution of Civil Engineers of Great Britain, and Mr. Octave Chanute, one of the foremost and one of the oldest civil engineers in the United States, have been elected honorary members of the Canadian Society of Civil Engineers.

Mr. W. H. Wiggs, of the Mechanics Supply Co., Quebec, was in Toronto last month attending the 35th annual convention of the Ontario and Quebec Young Men's Christian Associations. Mr. Wiggs is one of the most ardent workers in Y.M.C.A. work in Canada, and was honored by being elected president of the Ontario and Quebec Associations at the convention.

The annual meeting of the Williams Mfg. Co. was held at the office of the company, St. Henri (Montreal) on the 13th inst. Bartlett McLennan, the president, occupied the chair. The old board of directors was re-elected, and at a subsequent meeting, Bartlett McLennan was chosen as president and Chas. W. Davis, vice-president and managing director. Alex. Dube was appointed secretary.

Canadian Honored.

Dr. Howard T. Barnes, a graduate of McGill, has been chosen to succeed Dr. Rutherford as professor of physics in that university. It was announced at a special meeting of the board of governors at McGill recently that Dr. Howard T. Barnes, D. Sc. F.R.S.C., had received this appointment. He will succeed to a position held in recent years by two men whose services to science have been recognized the world over, Professor Callendar and Dr. Rutherford. Dr. Barnes has become one of the chief authorities on certain branches of physics. His researches extending over several years, on the specific heat of water, have become a classic, and after occupying the attention of the Royal Society of London at a special session, were made the basis of the report on this subject, to the conference of physicists at the last Paris Exhibition. His work on "Ice Formation and Frazil." on which he has recently published the first authoritative book, has important bearings on the utilization of water powers in northern countries, such as Canada and Russia ; and his recording thermometers are coming into use in the regulation of furnaces and other branches of manufacture.

Montreal Agent Marries.

A wedding of considerable interest to the Montreal trade took place Thursday afternoon when J. Sophus, Canadian representative of Schuchardt & Schutte of New York and Berlin, was married to Miss Jennie Colquhoun of Manchester, England. The ceremony took place at St. Thomas' Church, and was performed by the Rev. Canon Renaud. While distinctly private, a large number of immediate friends attended, and many handsome gifts were received. The young couple left on a short tour to the Southern States and on their return will take up their residence in Montreal.

J. Sophus has been in Montreal a little more than a year and a half during which time he has made steady progress. Formerly he was superintendent of large works in Manchester, England, and before that again had been engaged as a traveler for machinery and metals in Europe, visiting Germany and Russia as well as other countries. Gifted as a linguist he has exceptional advantages, and as Canadian representative of Schuchardt & Schutte he deserves congratulations. This firm have branches in China, Japan, Russia, France, India, and other places, having also immense headquarters in New York City. They have confidence in the Canadian market and are spending large sums this year to promote their interests. Canadian Machinery supplements the many good wishes extended to Mr. Sophus on his new step.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

PONDEROUS STEAM SHOVEL.

STEAM shovels have become an important adjunct to the development of a country, particularly in connection with the building of railroads and other heavy work. The Canada Foundry Co. are now manufacturing in a special department the Bucyrus steam shovel. The illustration given herewith shows more graphically than words the speed at which these shovels excavate the earth. The picture was taken as a string of flat cars were backing down a track besides one of the monster shovels, which kept on working as the cars passed it, and on each car was placed a load from the dipper. The facilities of the Canada Foundry Company are such that they are able to construct this class of heavy machinery in large quantities and they have removed the reproach that this class of work all had to be imported because it was not manufactured in Canada.

These shovels are of a ponderous size, weighing 90 tons apiece. Their capacity is shown by the fact that three loads of the dipper will more than fill a flat car. The building of these shovels is a new industry as far as this country is concerned, an appreciation of which is shown by the fact that the Canada Foundry Co. have received contracts for these shovels from the Canadian Pacific Railway, the Canadian Northern Railway and several firms of railway contractors.

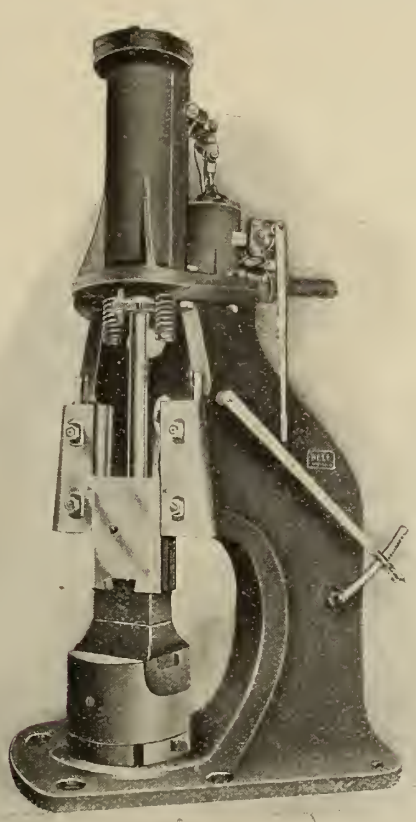
View Showing Bucyrus Steam Shovel at Work.

SPECIAL STEAM HAMMERS.

STEAM hammers of a special design are being placed on the market by the David Bell Engineering Works, an illustration of one being shown herewith. One of the main features of these hammers is that they are provided with reinforced guides which help to make up the main frame. This improvement consists in making the main casting at the point to which the lower end of the slides are bolted, fully fifty per cent. stronger and heavier than heretofore, and increasing greatly the strength by the addition of a vertical flange on the corss web tying the lower end of the slide faces together in the main casting. This greatly strengthens the point where the most strain comes. The stiffening of the column adds to the resistance to shearing at any point in the column.

The main working valve of the balanced piston type, works without friction in a removable bushing, which has steam port edges finished, thus giving uniform operation. Throttle valve is of the circular form, ground with emery in construction, to its seat and held tight by steam pressure. The 1,600 pound and larger sizes have quadrant connection to throttle valve, similar to that on main lever. Stuffing box or expansion joint connections are in cylinder casting, for steam and exhaust pipes. The valve motion is extremely simple, with few working parts, and giving the most accurate and sensitive control to the blow, not connected except by sliding contact with the hammer head. It is free from all shock or jar of blow, is therefore of the most durable and efficient construction, and requires no attention except proper lubrication. The hammer head is of hammered steel, with piston rod. The hammer head itself is set at the proper angle in the main frame casting, so as to permit drawing and finishing work either way of the dies, without the

work interfering with the column. Head finished from the solid, having gang milled "V" grooves, which work in adjustable "V" slides, which are also gang milled, with special formed cutters. This gives perfect bearing to the working surfaces in contact. The slides are of heavy construction, through bolted to the main frame, with spring washers on bolts, and are fitted iron and iron against taper gib extending entire length, and arranged for independent adjustment. Piston rod fitted to taper hole in head, the jam of which taper constitutes the real hold, but with a safety pin to give warning in case of rod getting loose.



Bell Special Steam Hammer.

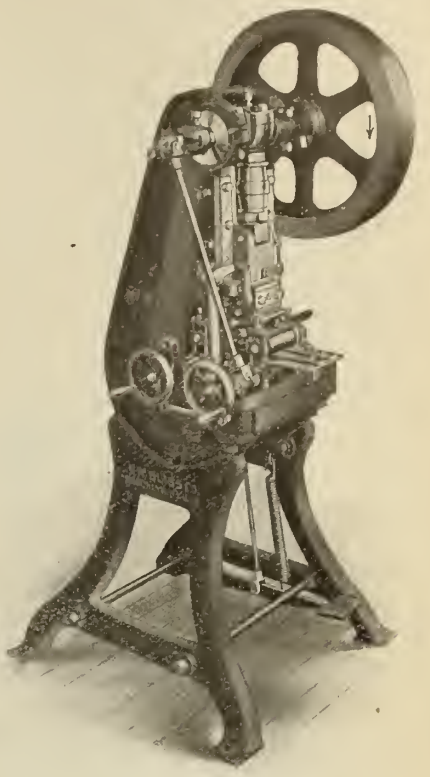
BLISS AUTOMATIC PRESS.

IN the accompanying half-tone is illustrated a small automatic press for making a six pointed, star shaped tobacco tag. The automatic mechanism embodies two distinct types of feeds, viz., a double roll feed and a lateral feed. The double roll feed is operated by means of a rod connection with a shaft at one end and with the feed crank at the other. Motion is given to the lateral feed by the movement of the slide in connection with the series of levers.

Two operations, which are necessary for making the tags, are performed at each stroke of the press after the first. The work is done as follows: Strips of stock of proper width and gauge are placed between the guide plates, the forward hand wheel is then turned so as to carry the strip well under the rolls. The press is now ready to do this work. A pressure on the foot treadle starts the press and causes the stock to be automatically advanced to its proper position by means of the first pair of rolls. The plunger carrying the blanking die and forming die will then descend, blanking out the tag, and the lateral feed will carry the cut blank under the forming die, where it is operated upon by the second stroke of the press as is customary in all regular double dies. The back roll feed is for carrying away the scrap and also for keeping proper tension on the stock. The capacity of this press is about sixty complete tags per minute. It weighs complete, as shown, about 700 lbs., and has been built by the E. W. Bliss Co., 20 Adams Street, Brooklyn, N.Y.

FRICTION PIPE WRENCH.

A SIMPLE friction wrench for manipulating polished brass and nickel-plated pipes, writes John Weldon, in Popular Mechanics, and shown in the accompanying sketch, is constructed of the handle, A, a piece of oak wood one inch thick, three inches wide, 14 inches long, with end of same rounded as shown at B; a piece of canvas, C, so

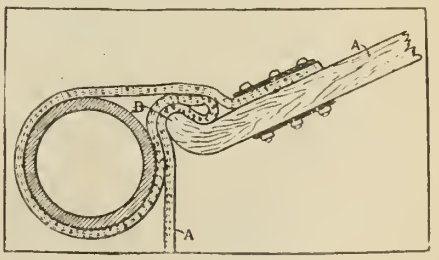


Bliss Automatic Press.

folded as to make three thicknesses and the same width as handle and about 18 inches long, so that it will encircle all ordinary work. It is fastened about 3 inches from end of handle by means of two brass plates 3 inches square and five countersunk bolts as shown.

To use the wrench pass the canvas around the pipe or other cylindrical object and tuck the folded end between the canvas and wood, as shown in the sketch. Then, when the handle is pulled down, the canvas will tighten around the pipe and under all ordinary conditions produce sufficient friction to turn it.

The use of this wrench will not mar



Home-Made Wrench.

the surface of the work, nor bend the pipe, because the compression is distributed evenly over nearly the entire circumference.

NIPPLE AND PIPE THREADING MACHINE.

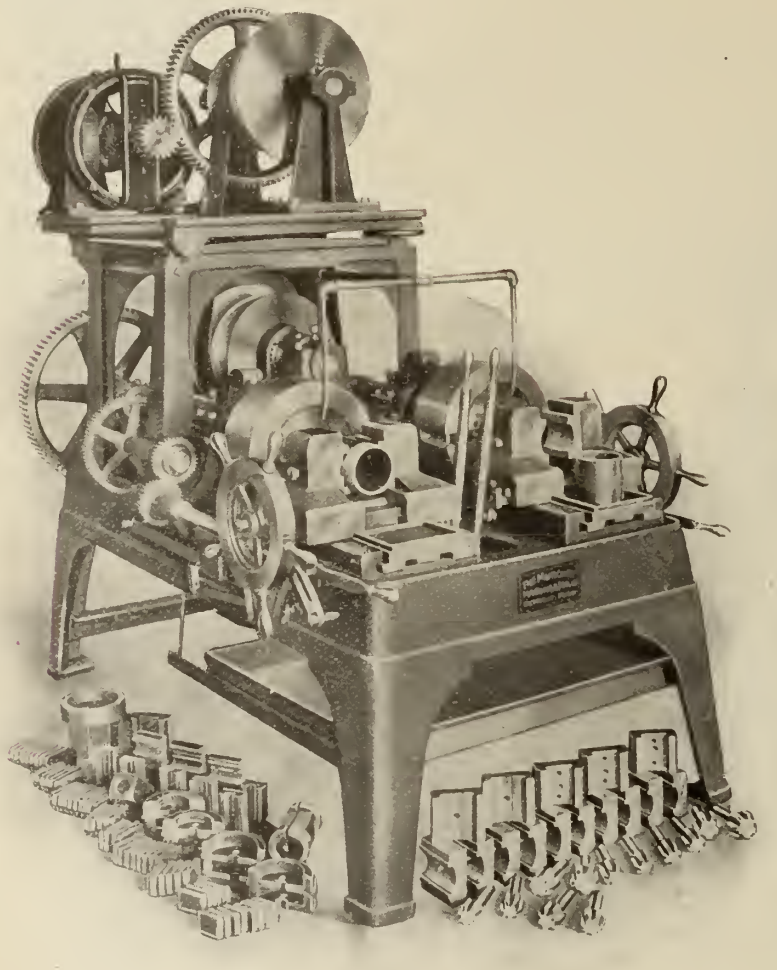
THE machine shown in the accompanying half-tone has recently been placed on the market by the Murchey Machine & Tool Co., and the makers claim that it is the only double head machine of its kind that has capacity to cut 2 4-in. threads at one operation. It has been designed to meet the requirements of manufacturers engaged in the manufacturing of pipe nipples or long lengths of pipe, and will cut 4 times as many threads as the old style machine.

The die heads on this machine are steel and of new design. There are 6 chasers held rigid in slots by face ring, the head is in two parts, and opens automatically from the centre by action of the reamer coming in contact with the end of the pipe when the thread has reached its proper length, combining the process of reaming internal end of pipe with the automatic action of releasing the die, thus insuring perfectly reamed pipes and uniform lengths of threads, regardless of the position of the pipe in the vise.

The vise jaws have exceptionally long bearing surfaces which makes this machine a very successful machine for threading close nipples.

There is a separate reamer furnished for every size pipe within the range of the machine. The lead screw attachment is one of the most important improvements recently put on this machine. In operating, this dispenses with the usual method of starting threads by hand pressure ; with the lead screw the operator simply puts the pipe in the vice grips and throws in the lead screw, no further attention is required, the operation is repeated in the other vise and when the first thread has reached its proper length the dies open automatically and the same action releases the lead screw. The combination is extremely simple as well as positive and effective. No special care is required in adjustments and every detail is so constructed that it is practically fool proof with safeties provided in case of unforseen accidents.

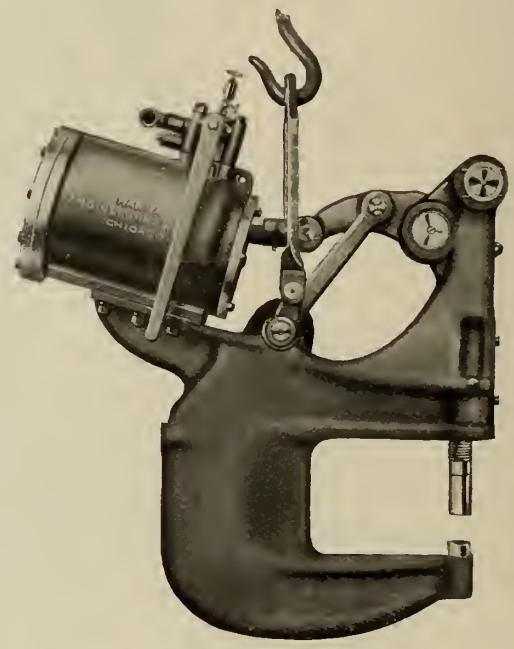
It has two three-step cone pulleys, diameters 12 in., 14 in. and 16 in., with 3½ in. belt surface. It has 6 changes of speed, 3 changes with the cones and 2 changes with the gears. The gear ratio is 25 to 1 for the heavy work. The motor shown on the machine is a 3½ horsepower motor made by the Triumph Electric Co. of Cincinnati. The makers of this improved nipple machine claim that it will easily produce 700 4 in. threads in 10 hours.



Nipple and Pipe Threading Machine.

HANNA SPECIAL LATTICE RIVETER.

THIS machine was designed for doing very close lattice work, and will drive ⅞-inch rivets in 10 inch channels 4 inches between the flanges. It has a reach of 15 inches and a gap of 12 inches, and the frame through the gap is 15 inches wide and 3¾ inches at its thickest point, tapering both ways. This will permit the riveter to swing from side to side in lattieing in the very small space of 4 inches.



Special Lattice Riveter.

The working mechanism of this machine has the regular Hanna motion, which means that it will exert a predetermined uniform known pressure for each and every stroke throughout the last half of piston travel, thereby driving absolutely tight rivets. This feature is distinct in the Hanna riveter alone.

The total output of coal in Nova Scotia for 1906 amounted in round numbers to 5,170,000 tons, an increase of 488,000 over 1905. The Cape Breton mines gave an increase of 352,000 tons, Pictou 88,500. Cumberland decrease, 34,506, Inverness 80,000.

Power and Transmission

Steam Gas Electricity Compressed Air Water

THE CLARKE FRICTION CLUTCH.

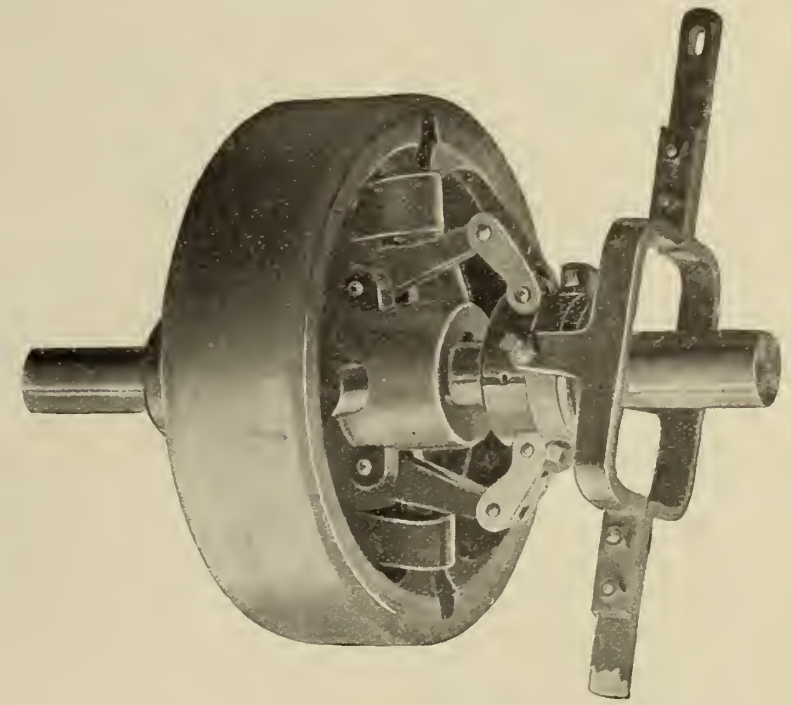
WM. & J. G. GREEY, 2 Church St., Toronto, have recently undertaken the manufacture of the Clarke friction clutch, which embodies distinctive features. The clutch is simple in design, and having few parts is not liable to get out of order. It is exceedingly strong and rigid and is claimed to have a larger frictional surface than any other clutch of its size. In it the oiling facilities have been well attended to, and the design is such that the few wearing parts may be quickly adjusted to take up all slackness.

The entire pressure is exerted uniformly over the whole surface, the pressure being not greater on the outside edge than on the inside. Being compact it occupies a very small space on the shaft. It can be regulated to shift when a given load is exceeded. This point is invaluable to some users when an overload endangers breaking valuable machinery. When the clutch is engaged it is self contained and requires no pins or strings to hold it at work. It is manufactured in sizes from 3 to 125 h.p.

THE GASOLINE ENGINE.

How to Treat Worn Valves, Cams and Cam Rollers and Gears.

A BAD running engine often indicates a worn condition of the valves, cams or the gears that actuate them. In very many cases of reported trouble we have found such a condition. Either the valve, cam, or the roller which travels over it, or both, are found badly worn on their surface, or the roller may become worn in its bearing where it operates on its spindle, or the spindle itself becomes worn. Another not infrequent thing is to find that the roller, on account of dirt, gum or being drawn up too snugly, gets stuck on its spindle and ceases to revolve as it should, and the result is that a flat place is worn on the roller at the one point only in its circumference which comes in contact with the cam. A cam roller is intended to roll as it passes over the cam, thereby reducing the friction on either to a minimum, and unless it does roll, a flat place will be the result. It is quite important, therefore, to take frequent notice of the cam and cam rollers while the engine is in operation as well as while it is at rest. Sometimes the cam roller may appear all right at rest, but soon after the engine is put to work it may get stuck, and the resulting friction very quickly damages it to such an extent that it cannot fill its office effectively. You see that when a roller gets stuck on its spindle it has to slide over the high part of the cam, which does the lifting of the valve, instead of rolling over as is intended. The sliding movement is also a grinding one, which quickly results in damage. The effect of a worn cam or cam roller can be seen when we carefully consider what they



The Clarke Friction Clutch Coupling.

are naturally required to do. It is of course known that the cam is intended to open the valve as well as to allow it to close. The valve must open and close at the proper time, or in harmony with the piston movement. It must also in opening lift high enough from its seat to give the valve port a free clearance. We will assume for instance that a valve-cam becomes worn right at the point where it comes in contact with the roller to begin opening the valve. The least bit of wear at this point causes the valve to open a little later and the more the wear the greater the delay in opening the valve, consequently the valve is prevented from operating harmoniously and at the proper time with the piston movements, and its functions and usefulness are impaired just to the extent of the wear on the cam. If the cam becomes worn on its entire surface it not only opens the valve too late, but allows it to close too early and does not lift it high enough from its seat. A flat place on a cam roller, even if the cam itself is not worn, will have the same effect, exactly.

Let us consider what effect this delayed and reduced valve movement will have on the running of the engine. The exhaust valve, for instance, has for its function the relief of the cylinder from its internal pressure by letting out into the open air the burnt gases after they have pretty well spent their force against the piston on its outward and working stroke. And inasmuch as there yet remains quite a pressure at the end of the working stroke the valve should open before the end of the piston's working stroke, at about four-fifths of the stroke, in order to let out and reduce, as near as possible, the pressure within the cylinder to atmospheric pressure by the end of the working stroke. If the valve should not open until the piston started on its exhaust movement, the pressure within could not be relieved fast enough for the piston travel, and it would be compelled to

crowd against a pressure on its entire exhaust stroke. It would take quite a liberal percentage of the power that the previous impulse from the gas explosion had stored in the rims of the flywheel to overcome this pressure against the piston during its exhaust stroke, and when it should have a free movement without practically any opposition. Therefore, in order to save instead of wasting this power, the exhaust valve should be opened when the piston has completed about four-fifths of its working stroke. This will allow a good share of the remaining pressure to escape through the exhaust valve while the piston is completing its working stroke, and there will be no perceptible resistance to its exhaust movement, because the exhaust valve remainsure and burnt gases, so that by the time the piston has reached the end of the exhaust stroke the space within the cylinder behind the piston has reached the point of atmospheric pressure. The exhaust valve then should open before the end of the working stroke of the piston and remain open during the entire exhaust stroke, about 1 1-5 piston movement in all. Any wear on the cam or cam roller that gives the valve less advantage that this is a direct hindrance to power output from the engine. The valve must open in time so that the pressure within the cylinder has dropped nearly if not quite to atmospheric pressure by the time the piston begins its exhaust stroke, so that it may have a free and unobstructed movement on this idle stroke.—American Blacksmith.

(To Be Continued.)

VIBRATING STUFFING BOX.

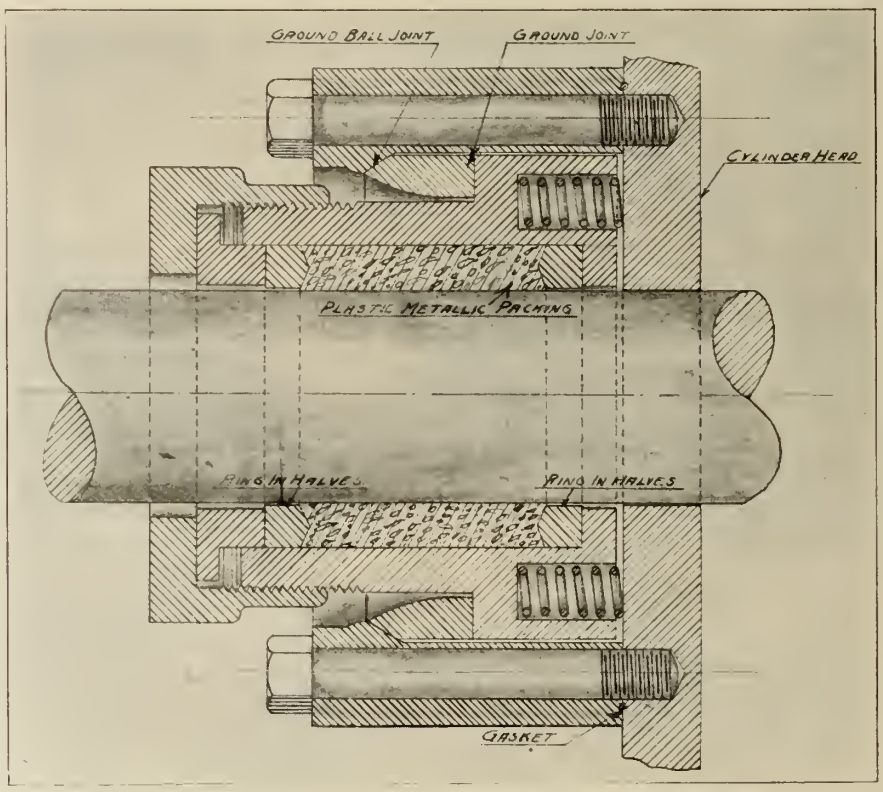
THIS stuffing box automatically adjusts itself to any out of line movement of the piston rod or stem. It will be observed that the stuffing box is arranged within a casing and is held against the ground ball joint ring by means of springs, assisted by the steam pressure from the cylinder, keeping the joints tight, and preventing leakage. A clearance is provided between the stuffing box and the interior of the casing, and between the rear surface of the stuffing box and the cylinder head. This permits the stuffing box to move laterally relative to the casing, to compensate for out of line movement of the rod or stem, and to rock on the curved face, or ball joint, to adapt itself to any angular movement of the rod.

The spacing rings at each end of the packing work in connection with the packing, holding the stuffing box out of contact with the moving parts, thus preventing wear.

On Dec. 1st, 1906, one of these stuffing boxes was placed on the main piston rod of a 100 h.p. engine in the Butterfield Power Bldg., Detroit. When the stuffing box was applied to this engine the piston rod was placed out of line so as to have an angular, as well as a lateral movement of more than 1-16 in., and it has been found that the stuffing box "floats with the rod" without any resistance, performing perfect work.

In this instance the stuffing box is packed with plastic metallic packing, although it will be seen that any suitable packing can be used.

Since the stuffing box was placed in operation it has been inspected by many mechanical experts who have expressed much interest in its operation, and all have pronounced it a most practical and economic device.



Vibrating Stuffing Box.

The Steel Mill Packing Company of Detroit, Mich., are equipping their factory with machinery for manufacturing these vibrating stuffing boxes and will soon be prepared to place them on the market.

STEAM ECONOMY IN ROLLING MILLS.

A RATEAU exhaust steam accumulator and turbine has been installed at the Hallside Works of the Steel Company of Scotland to use the exhaust steam from one high pressure cogging machine with two cylinders, each 40 x 60 in., one finishing train engine with two cylinders, each 42 x 60 in., two small mill engines and four steam hammers, delivering a total of about 41,000 lb. of steam per hour. The power is used for lighting and to drive rolls, saws, sand blast apparatus and machine tools. The accumulator, which has two compartments, separates from the water any oil carried over, and maintains the water in energetic circulation. It has a diameter of 11 ft. 6 in. and a length of 34 in. The turbine is rated at 700 h.p. and has 11 sets of blades, with wheels 40 in. in diameter. It develops its full power at a speed of 1,500 revolutions per minute, and when working at an overload of 10 per cent. the inlet pressure is never over 12 lb. absolute. The vacuum is 28 in. The generator was designed to deliver 2,000 amperes, and has carbon brushes and a commutator provided with special ventilating ducts through the centre. The ventilation is set up by means of a fan blade attached to each bar. Tests of the unit have shown a consumption of 66.4 lb. of steam per kilowatt hour at one-tenth load, and with an absolute inlet pressure under 3 lb. per square inch. At 200 k.w. load and an absolute admission pressure of 5.35 lb., the consumption was 42 lb. per unit. A half load and an admission pressure of 8.25 lb. absolute, the steam used was 37 lb. per unit. With a load of 450 k.w. and an admission pressure of 11.4 lb. absolute, the figure was 36.6 lb. The vacuum fell during these tests from 28.7 in. to 27.9 in., as the load increased.

Companies Incorporated

A company has been formed in Kingston for the manufacture of brick. It will be called the Perfect Brick and Tile Company, having a capital of $50,000.

The Dominion Power & Transmission Co., capitalized at $25,000,000, has been incorporated to develop water and other powers for the generation of electric, steam, pneumatic, and hydraulic power, with head office at Toronto.

The British Columbia Car Co., capitalized at $1,000,000, to manufacture freight cars, street cars, etc. Directors, A. C. Flumerfelt, J. G. Woods, F. Buscombe, Alfred Kelly and M. M. Campbell. Head office, Vancouver, B.C.

Messrs. Ney, Camp and Company have been incorporated with a capital of $40,000 for the purpose of manufacturing furniture, etc. The head office will be at Stratford, and provisional directors being, W. J. Ney, N. W. Camp and J. H. Bamber, Stratford.

The Gamer Manufacturing Company has been incorporated with a share capital of $50,000 for the purpose of manufacturing bedsteads, etc. The head office will be at Chesley, the directors being: Arthur Gamer, Ada Gamer, A. Harrod, T. E. Devitt and F. Gillon of Weston, Ont.

The Collingwood Shipping Co. has been incorporated with a capital of $90,000, for the purpose of constructing elevators, wharves, docks, warehouses, etc. The head office will be at Collingwood, and provisional directors being, W. T. Allan, M. Brophy and W. A. Hogg, of Collingwood.

The Standard Concrete Construction Company, Toronto, has been incorporated with a capital of $100,000, for the purpose of general building and construction. The head office will be at Toronto, and provisional directors being, F. Rielly, J. B. Bartram and E. A. Scott, Toronto.

M. McKenzie & Company have been incorporated with a capital of $75,000 for the purpose of manufacturing railway, marine and contractors' supplies. The head office will be at Montreal, the directors being, W. D. Hamilton, A. A. Lunan, A. Dunn, L. Lahaye and A. Lunan of Montreal.

The Wingold Stove Company has been incorporated with a capital stock of $40,000, for the purpose of manufacturing stoves, ranges, furnaces, etc. The head office will be at Winnipeg, the directors being: F. B. Blanchard, O. Gensmer, R. Kellow, L. Blanchard and I. A. Mackay, of Winnipeg.

Love Brothers, has been incoruorated with a share capital of $150,000 for the purpose of manufacturing building materials and supplies. The head office will be at Toronto, the provisional directors being: P. Love, H. W. Love, E. G. Long, F. Orford, W. J. Coulter, and E. J. Barton of Toronto.

The A. Workman and Company has been incorporated with a share capital of $60,000 for the purpose of manufacturing and dealing in hardware. The head office will be at Ottawa, the directors being T. Workman, A. Workman, and A. A. Whillians, of Ottawa.

The Brandon and Robertson Manufacturing Company has been incorporated with a capital of $75,000, for the purpose of manufacturing implements, machinery, etc., the head office to be at Brandon, Man,, and provisional directors being, W. Brandon, J. A. Robertson and R. J. Brandon, of Brandon, Man.

The Eastern Construction Company has been incorporated with a share capital of $1,000,000, for the purpose of manufacturing machinery for construction purposes. The head office will be at Ottawa, the directors being: J. Gillespie, H. H. Short, F. H. Honeywell, S. B. Johnston and J. B. Prendergast of Ottawa.

Trussed Concrete Steel Company of Canada, has been incorporated with a share capital of $200,000, to manufacture materials used in connection with concrete reinforcement. The head office will be at Walkerville, the directors being G. Kahn, D. C. Raymond and L. Wiman, of Toronto.

The M. McKenzie Company has been incorporated with a capital stock of $75,000 for the purpose of manufacturing mill, marine, railway and contractors' supplies. The head office will be in Montreal, the directors being: U. D. Hamilton, A. A. Lunan, A. Dunn and L. Lahaye of Montreal, and Alex. Lunan of Huntingdon, Que.

The Montreal Wood Mosaic Flooring Company has been incorporated, with a capital stock of $5,000, for the purpose of manufacturing wood flooring, window and door screens, steel mats, etc. The head office will be at Montreal, the directors being, A. McLean, Buffalo, and D. H. McLennan, C. Stewart and R. W. Barclay, of Montreal.

The Crescent Machine Company has been incorporated with a share capital of $20,000 for the purpose of manufacturing machinery, implements, rolling stock and hardware. The head office will be at Montreal, the directors being: C. M. Gardiner, C. D. Drabble, W. A. Patterson. H. S. Williams and W. Bovey, of Montreal.

The Dominion Smelters, Limited, has been incorporated with a share capital of $1,000,000 for the purpose of carrying on business as miners and refiners. The head office will be in Sault Ste. Marie, Ont., the provisional directors being H. H. Muggley, W. S. Peters, and T. J. MacCune, of Oshkosh, Wisconsin.

The Georgian Bay Oil Company has been incorporated with a share capital of $1,000,000 for the purpose of carrying on business as gas producers and petroleum oil refiners. The head office will be in Fort Erie, the provisional directors being S. Johnston, F. B. Johnston, F. R. MacKelcan, A. J. Thomson, and R. H. Parmenter, of Toronto.

The North Shore Transportation and Wreckage Company, Quebec, has been incorporated, with a capital stock of $250,000, for the purpose of manufacturing vessels, steamboats, machinery, etc., and to construct wharves, piers, warehouses, etc. The head office will be in Quebec, the directors being, J. A. Fafard, O. C. Bernier and A. Tegnon, of Quebec.

The Theodore Lefebvre and Company has been incorporated with a capital stock of $80,000, for the purpose of manufacturing all kinds of paints, oils, chemicals and drugs. The head office will be at Montreal, the directors being C. A. M. Lefebvre, L. M. T. Lefebvre, R. B. Lefebvre, and L. S. Lefebvre, of Montreal.

The Consolidated Bicycle and Motor Company, Winnipeg, Man., has been incorporated, with a capital of $60,000, for the purpose of manufacturing bicycles, motor cars, boats, pumps, etc. The head office will be at Winnipeg, provisional directors being C. T. Cruikshank, J. A. Hudson and J. S. St. Mars, all of Winnipeg.

The Foreign Rail Joint Company has been incorporated with a share capital of $50,000 for the purpose of manufacturing rails, rail joints, angle bars, and all kinds of railway supplies and railway contractors' supplies. The head office will be at Toronto, the provisional directors being J. S. Lovell, W. Bain, R. Gowans, and E. W. McNeill.

The Canada Arms and Rifle Sights Company has been incorporated with a share capital of $200,000 for the purpose of manufacturing guns, rifles, and other small arms; also to acquire the business of the Mitchell Rifle Sight Company. The head office will be at Toronto, the provisional directors being H. Dixon, T. Cocking, and R. Staite, of Toronto.

Cameron & Company has been incorporated with a share capital of $100,000 for the purpose of manufacturing furniture, doors, sash, pulp, turpentine, wood alcohol, etc. The head office will be at Ottawa, the provisional directors being: U. A. Cameron, R. G. Cameron, G. C. Edwards, G. Cameron of Ottawa, J. H. Gates of Burlington, and Hugh McLean of Buffalo, N.Y.

"Warden King, Limited," has been incorporated with a capital stock of $1,000,000 for the purpose of manufacturing all kinds of heating apparatus, soil pipes, steam fittings, builders', plumbers', and steamfitters' supplies. The head office will be in Montreal, the directors being J. C. King, L. A. Payette, R. C. McMichael, of Montreal, and W. Grieg and F. G. Bush, of Westmount, Que.

The Canadian Rand Company has been incorporated with a capital stock of $500,000, for the purpose of taking over the Canadian Rand Drill Company and continue in the manufacture of air compressors, rock drills, pumps, pneumatic tools, etc. The head office will be at Sherbrooke, Que., the directors being, G. Doubleday, New York; E. Webber, of Montreal; S. W. Jenckes, W. Fanwell and H. D. Lawrence, of Sherbrooke, Que.

Industrial Progress

CANADIAN MCHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc All such correspondence will be treated as confidential when desired

An opera house will be erected at New Liskeard, Ont.

Universal Systems, Toronto, have decided to erect a plant in Montreal.

A new hotel will be erected at Kenora, Ont., at the cost of $100,000.

A new Y.M.C.A. building will be erected in Montreal at the cost of $300,000

A market building will be erected at Berlin, Ont., at a cost of about $20,000.

A new Baptist church will be built on Pape Avenue, Toronto, at a cost of $4,500.

Plans are being prepared for the erection of a new hotel at Kingston to cost $120,000.

An up-to-date hotel building is going to be erected at Woodstock at the cost of $60,000.

The Vancouver Portland Cement Company, operating at Tod Inlet, B.C., are enlarging their plant.

The Mickle-Dyment planing factory at Brantford will have a $10,000 extension made in the Spring.

The factory of the Boston & Lockport Block Co., manufacturers of marine pumps and blocks, 100 Condor St. E., Boston, was partially destroyed by fire on Feb. 1st.

A sand lime brick plant is to be established in Brantford by John Mann & Sons and the American Clay Machinery Co. The capacity will be 30,000 brick per day.

Wm. Baird, Woodstock, has moved his machine shop from Victoria street to Dundas street. A new building has been erected, and additional machinery will shortly be installed.

Ottawa proposes purchasing the works and rights of the Metropolitan Electric Co., at Britannia, where it is claimed 10,000 h.p. can be developed for an additional expenditure of $250,000.

Permits have been issued in Toronto for the erection of a grand stand and horticultural buildings at the Exhibition grounds. The former will cost $216,465 and the hortieultural building $90,000.

The production of lead in Canada for the year 1906 amounts to 26,000 tons. The production for 1905 was 27,000 tons. The record year was 1900, when a total of 30,000 tons was reached.

The Canada Cycle and Motor Company, of Toronto Junction, has purchased property in Ottawa, and will erect showrooms, and repair shop, expecting to be open for business in the Spring.

The rail mill of the Lake Superior Corporation has been turning out 700 to 750 tons a day. The rail output this month is expected to run 18,000 tons against 16,700 tons the previous high record.

A large bank building will be erected at Victoria, B.C., by the Royal Bank of Canada. The Bank of Nova Scotia have also purchased property on King street, Toronto, and will erect a bank building.

The Link-Belt Co., Philadelphia, has acquired a new office location at 84 State street, Boston, from which the future business of its drive chain department in New England will be looked after.

The Dominion Steel Company's Sydney rail mill in January broke the record for the greatest monthly production of steel rods, Their mill turned out 7,960 tons, the former record being 7,000 tons.

A $110,000 hotel will be erected by E. J. Fader, of the Torpedo Touring and Tug Company, at New Westminster. The new building will be known as the Hotel Russel and is to be completed by October, 1907.

Another rich discovery of iron ore has been made near Port Arthur, which has proven to be the most extensive and highest grade ore found in that section. Samples of the red-ore will assay 60 per cent. iron.

The Canadian-Mexican Pacific Steamship service will carry samples of general merchandise free of charge to the various ports touched by them in order to show what Canada and Mexico have to offer each other.

A new grain elevator with a capacity of about 10,000,000 bushels will be erected at Port Arthur for the Grand Trunk Pacific Railway. The contract has been awarded to Barnett and McLean of Port Arthur.

A new company to manufacture cement in Montreal proposes to turn out 2,500 barrels a day. This will be one of the largest cement works on the continent. The contract for the buildings has already been let.

The Petrolea Association of Stationary Engineers was formed at a meeting held on Feb. 13, and the following officers were elected: Hon. Pres., J. E. Armstrong; Pres., H. A. Day; Vice-Pres., F. Stonehouse.

The Jackson Co., of Goderich, commenced operations in their new quarters in Goderich about the middle of February, beginning with a staff of 20 hands. The company's specialty will be the manufacture of boys' clothing.

"Electro Metals, Limited," is the name of a New York concern which purposes to build and operate an electric ore-reducing plant in the Niagara Peninsula. English capital from New Castle, Eng., is largely interested.

The Canadian Pacific Railway Co. will build a new depot at Calgary, Alta. It is estimated that the structure will cost $200,000, and outside of Winnipeg will be the finest on their western lines, and one of the finest on the whole system.

When the Galt Malleable Iron Works opened in October last 25 men were employed. Last pay-day at the works 132 regularly employed workmen received their pay envelopes, an increase of over 400 per cent. in the number of employes.

The plant of the Chapman Double Ball Bearing Co., Toronto, has been moved from Pearl street to Sorauren avenue. The new premises and equipment are up-to-date and complete in every particular. The office address of the company will still be Scott street.

The Canadian Pacific Railway will make large and important additions to their shops at Winnipeg, involving the expenditure of half a million dollars, as soon as the weather will permit of commencing operations. Nine buildings are included in the plans.

The plant of the Canadian Glass Works, located on the outskirts of Montreal, and employing about 150 hands, was burned to the ground on Wednesday. The loss is in the neighborhood of $20,000 on the plant and equipment and is covered by insurance.

The Imperial Steel and Barb Wire Co., of Collingwood, is looking for a suitable point in the west to establish a plant for the manufacture of barb wire and nails. The company is looking for inducements, guaranteeing to employ 100 to 200 men all the year round.

At the annual meeting of the International Portland Cement Co., held in Ottawa this week, the shareholders approved the recommendation of the directors to double the capacity of the plant at Hull. At present it is turning out 2,000 barrels of cement per day.

A number of final year students in electrical engineering at McGill University visited the works of the Canadian Westinghouse Co., at Hamilton, on Feb. 16. A tour of the works was made and luncheon was served by the company. The party also visited Decew Falls.

The Canadian branch of the American Locomotive Works at Montreal, is largely extending its structural steel plant, and has so many orders booked for this kind of steel that even the enlarged plant will be kept running to its fullest capacity throughout the year.

A large, four-storey building in Hamilton will be erected in the Spring, and will be sub-let to small manufacturers. This proposition should meet with great success, as small manufacturers are frequently handicapped by being unable to get suitable buildings in starting out.

The main building of the new plant which Jenkins Bros., New York, valve manufacturers, are erecting in Montreal, will be 200x50 feet. There will also be a foundry 150x64 feet, and an engine and boiler room 60x45 feet. Later, the company expects to build a foundry 100x60 feet.

The Stratton Babbit & Car Bearing Co., of Moncton, N.B., decided at their annual meeting to accept a proposition from the city of Montreal to remove its factory there. The following directors were elected: Messrs. Simpson, E. M. Jones, James Flannagan, J. R. Stratton and R. A. Borden.

The Dominion Bearing Company, of St. Catharines, are manufacturing automobile equipment, engines, running gear and bearings for supply to a selling concern. The company will shortly place on the market an improved roller bearing. About eighteen men are now employed in the works.

W. H. Banfield & Sons, of Toronto, are supplying the Massey-Harris Co. with four 1,000-pound drop hammers. This order was secured in competition and is a compliment to the ability of this firm to undertake such work on a large scale. Each of these hammers will weight 20,000 pounds.

The total amount paid to date in iron and steel bounties in Canada is $8,814,833, of which $998,000 went to the Soo Company; $1,416,469 to the Hamilton companies; $151,095 to the Deseronto company; $1,369,158 to the Nova Scotia Steel Co., at Sydney, and $3,466,519 to the Dominion Steel Co.

The King Edward Hotel, Toronto, is to be enlarged this spring, when a two-storey addition will be added. This will provide 200 more rooms, 100 on each flat. A lot of new machinery will be installed for lighting and other purposes, and for power to run a number of up-to-date labor-saving machines.

The Nova Scotia Steel and Coal Company will carry out their original intention of erecting another furnace. Already orders have been received which far exceed the capacity of the plant, and in order to keep up with the increasing demand the company will have to enlarge their works by another furnace.

One of the largest sawmills on the Pacific coast is to erected shortly at Vancouver. The contract for the machinery of the new plant has been let to the Prescott Co., of Menominee, and the contract is let to E. H. Heaps & Co. The new plant will have a capacity to handle logs ten feet in diameter and 110 feet long.

A $10,000,000 corporation is in process of formation with a view to entering into competition with the Pittsburg Reduction Co., the heaviest producer of aluminum in the United States. It is reported that the enterprise will erect a plant along the Cumberland River, in Kentucky, at a cost approximating $3,500,000.

The Ham & Nott Company, of Brantford, are about to build a large factory in Ottawa. The new factory will manufacture bee-keeping supplies, spring beds, and screen doors, and will employ over one hundred hands while in full operation. Arrangements are now being made with regard to a suitable site and other features.

A shipbuilding company is to be formed at Kingston, with a site on the west side of the dry dock. The company will likely have a capital of $100,000. Already the companies existing here are full of business, and there is easily a field for increased and larger operations. The new company would be handy for repairing vessels that enter the dock.

An agreement has been signed with the town council of Welland by E. Billings, of the Spencer Company, of Hartford, Conn., the largest manufacturers of drop forgings in the United States, to locate there. The branch will be known as the Canadian Billings and Spencer Company, and plans for a plant to cost about $100,000 will be prepared at once.

The Sanderson-Harold Company, of Paris, manufacturers of refrigerators, screen doors, etc., contemplate building a large addition to their factory, making it double the capacity of the present one. The move is compulsory in order to keep pace with the growth of business. 70 hands are now employed and the factory has been running day and night for months.

The following directors were elected at the annual meeting of the Shawinigan Water & Power Co., held in Montreal on Jan. 28: President, Senator MacKay; vice-president, Mr. J. E. Aldred; directors, Messrs. John Joyce, W. R. Warren, H. H. Melville, Thos. McDougall, Denis Murphy, William Mackenzie, J. N. Greenshields, and Howard Murray, secretary.

The Montreal Steel Works made a record showing in the fiscal year ending Dec. 31. The financial statement submitted at the annual meeting shows that the management has placed the company in a very strong position. Net earnings for the year amounted to $196,997, and after the payment of dividends on preferred stock there was earned over 20 per cent. on the common stock.

The Huber Mfg. Co., of Marion, Ohio, is establishing a branch for the manufacture of agricultural implements at Portage la Prairie, Manitoba. To accomplish this an amalgamation has taken place between the company and the Portage Iron & Machine Co. When final arrangements have been made this company will have one of the most complete machine establishments in the west.

The Dominion Graphite Company, of New York, will erect a large mill, representing an outlay of nearly a million dollars for the treatment of graphite, to be mined in the Laurentian ranges near Buckingham, Que. Not long ago the Dry Concentrating Company, of New York, announced their intention of erecting a smelter with the same object in view, and both plants are now in course of construction.

A pair of 42 in. horizontal Canadian turbines have just been installed in the plant of the Collins Inlet Lumber Company to drive their saw mills and box factory. These turbines will work under a head of 29 feet, developing 150 h.p. They were furnished by Chas. Barber & Sons, Meaford, Ontario, patentees and sole makers of these turbines. A pair of 36-inch horizontal Canadian turbines are also being installed for the Delhi Light & Power Co.

Montreal is to have a big new cotton mill. W. T. Whitehead, formerly of the Dominion Textile Company, and for many years identified with the cotton interests, has been successful in forming a company with a capital of $1,500,000, under the title of the Mount Royal Spinning Company. All the capital has been subscribed. The new mill, which will be situated either at Maisonneuve or on the Lachine Canal, will, it is expected, be in operation in eighteen months.

The Hamilton Radial Railway will make application to Parliament during the present session for an amendment to its charter, permitting of an extension from Mimico to Toronto, the purchase of the Brantford & Hamilton Electric Railway, Hamilton, Grimsby & Beamsville Railway, or others entering Hamilton, and the construction of a line from Brantford to the Detroit river, an international bridge over the Niagara, and a ferry system on the Detroit river are also included.

Ham and Nott, manufacturers of refrigerators and screen doors, Brantford, will likely build another plant, double the size of present one. Owing to being unable to make satisfactory arrangements with Ottawa it is probable they will not go there. The company at present employ 125 hands and are working day and night. In the event of the management maintaining their head plant at Brantford, the number of employees will be doubled.

A delegation composed chiefly of members of the legal profession waited on the Hon. Frank Cochrane, Minister of Lands, Forests and Mines, on behalf of their clients, to disapprove of a plan to impose a tax per acre on mining lands. He intimated that at least part of the revenue derived from taxation of the mines of the province would be applied to encourage the smelting and re-

fining of ores in Ontario, as it would increase in the value of mining properties, besides allowing their owners to work deposits of ore of lower grade than was profitable at present.

The McClary Manufacturing Co., after investigation and comparison of cost, have decided to install a producer gas plant for manufacturing purposes in their factory at London, instead of making use of Niagara power.

Enormous Industry.

Commissioner of Industries Thompson, of Toronto, is in touch with the principals of the Paris Industrial Co., the Compagnie Des Metaux Unitas, of Paris, France. This firm is being represented in Canada at the present by Mr. Alfred Yeates, who hopes to establish a large branch of their company in this country. It will mean the employment of between 1,000 and 3,000 hands, for the manufacture of mining tools of all kinds. This firm holds the rights of a patent process of steel for which great things are claimed. The Paris works of this company employ 7,000 hands, and a branch in Alsace 3,000. Every effort is being made to procure this industry for Toronto, and Commissioner Thompson hopes it will definitely locate. Brantford is also trying to prove its desirability as a site for the proposed works.

Increasing Rapidly.

Since commencing operations the Galt malleable iron works has almost daily increased its pay roll, which now amounts to 140 men. The directors have already decided to enlarge the works and plans have been drawn for an extension. It is contemplated thus to double the capacity of the plant and by August it is expected there will be 300 men at work in the shops.

Disastrous Fire.

A serious conflagration took place at the works of Goold, Shapley & Muir, of Brantford, entailing a loss of about $35,000. The three-storey western section of the plant, including the repair shop, the wood department on the ground floor, the paint shop and wood shop, and the tin and bee supplies department, are practically destroyed. The machine shop was slightly scorched, but did not receive serious injury. The origin of the fire was a heated journal on a small engine in the repair department on the ground floor. The portion of the works not destroyed by fire will continue running, although about 35 men will be thrown out of employment for some time.

To Manufacture Cars.

The British Columbia Car Co. has been incorporated in Vancouver, with a capital of $1,000,000, to engage in the manufacture of freight and street cars and other kindred work. It is recognized that there is a splendid opening in Vancouver for the establishment of a car building industry. This has been shown particularly during the past season, where a shortage of cars has existed on all lines. As a large part of the lumber entering into the construction of these cars comes from British Columbia the company should be in a position to manufacture with greater economy.

New Agencies Secured.

The London Machine Tool Co., 1206 Traders' Bank building, Toronto, have recently secured the sole agency for Canada for Potter & Johnston, Pawtucket, R.I., manufacturers of automatic chucking lathes and universal shapers; and also for the Murphy Machine & Tool Co., of Detroit, manufacturers of tapping machines, automatic nipple machines, and automatic collapsing taps and dies. These new articles are in keeping with the numerous other lines for which the London Machine Tool Co. are agents, and their acquisition speaks well for the progressiveness of the firm.

LEATHER BELTING IN CANADA.

THE J. C. McLaren Belting Co., of Montreal, are the pioneer manufacturers of leather belting in Canada, having been established by the late J. C. McLaren in the year 1856, 51 years ago. Later on the manufacture of card clothing and reeds was taken up, and having always had a regard for the quality and workmanship of their

F. A. JOHNSON,
Director and General Manager, J. C. McLaren Belting Co.

products, the building up of a very large business was the natural connecting result. Other important features which have helped to place the firm in the high position it now occupies are: The courteous treatment of customers, and the absolute guarantee of satisfaction that goes with goods sent out of the factory.

After the death of the founder of the firm, the business was successfully carried on by his son, D. W. McLaren, until his death a year ago last August, when the management came under the hands of F. A. Johnson, who for some years previously had been connected with the company. Mr. Johnson is an energetic business man as well as a competent manager, and dating from the day that he took over the "big chair" the business has forged steadily ahead.

The firm now employs a large number of travelling salesmen, who cover the country from coast to coast, besides having agencies or branches, where complete stocks are carried, in twelve Canadian cities, not counting the head office, at 292 St. James St., Montreal.

Agencies and Branches.

St. John, N.B., Canadian Oil Co.; Hamilton, Alexander Hardware Co.; Ottawa, W. F. Colston Co.; Toronto (Branch), 50 Colborne St.; London, Ont., A. Westman; Winnipeg (Branch), Telfer Building; Chatham, Ont., Park Bros.; Calgary, Great West Saddlery Co.; Edmonton, Great West Saddlery Co.; Regina, H. W. Laird & Co.; Prince Albert, A. W. Woodman; Vancouver, Canadian Fairbanks Co.

General Manager.

The active head of this firm is Mr. F. A. Johnson, who, as general manager, is developing the business at a rapidly increasing rate.

In the early eighties he entered the lumber business, and for seven years followed this line, becoming thoroughly acquainted with the business in all its branches, from the time the logs were cut in the woods until they were sawn into lumber. The next few years he engaged in the mining and milling of ores in California, when he returned to Canada, having accepted the position of assistant manager of the English Portland Cement Co., at Marlbank, Ont. Serving a number of the same interests his field was transferred to Montreal in connection with the mining and milling of asbestos for the Standard Asbestos Co., of which company he became a director and secretary-treasurer

Some years ago, while remaining a director of the Standard Asbestos Co., he became actively associated with The J. C. McLaren Belting Co., of Montreal, the oldest firm in the leather belting business in Canada, succeeding to the position of director and general manager on the death of Mr. D. W. McLaren. The policy of producing the highest class of goods, and fair dealing, which has characterized this business from its inception, and to which it owes its continued success, is being faithfully carried out. This, coupled with Mr. Johnson's long experience in the using, as well as the manufacture, of belting, should bespeak for the firm a very large share of the general prosperity Canada is enjoying to-day.

Brilliant Banquet.

The employes' banquet of the Waterous Engine Works Co., Brantford, held on the evening of Feb. 8th, was a brilliant success. This has come to be an annual institution in the lives of those connected with this company, and from what has been accomplished in this direction has evidently come to stay. The committee in charge were: J. Whiting, A. Styles, C. Hay, George Baird, W. Strie, J. Fyle, D. McLean, M. Blaeker, T. R. Logan and G. Pickles. The hall was handsomely decorated for the occasion, a feature of the decorations being a steel model of a fire ladder truck intertwined by ferns and carnations. At the head tables were seated W. G. Raymond, chairman of the evening; Mrs. C. H. Waterous, Judge Hardy, Mrs. Logan Waterous, Mr. C. A. Waterous, Mrs. D. J. Waterous, Mr. Julius Waterous, Mrs. Judge Hardy, Mr. C. H. Waterous, president of the company, Mrs. Julius Waterous, Mr. D. J. Waterous, vice-president, Mrs. C. A. Waterous, Mr. Logan Waterous and Mrs. A. T. Waterous.

As toast-master and chairman of the evening Mr. W. G. Raymond was the man in the place. After the toast to the King had been heartily received, a toast to our guests was responded to by Mr. Chas. Waterous and Mr. D. J. Waterous. Canada was ably upheld by His Honor Judge Hardy. The ladies were not forgotten, a toast being ably responded to by Mr. W. Giddens. In the absence of Mr. Cockshutt, "Constitutional Liberty" was responded to by G. Pickles, after which a hearty vote of thanks was tendered to all responsible for the success of the evening. A pleasant incident of the affair was the presentation by Miss Farrell, on behalf of the employes, of a beautiful vase full of scarlet roses to Mrs. C. H. Waterous.

Montreal Busy.

Montreal will have a busy 1907. During the year the Simplex Car Works, along the Lachine Canal, are to be greatly extended, so as to give double the ordinary capacity. The Canada Car Company have already more orders than they can attend to, and may also have to extend. In the same neighborhood are the Allis-Bullock-Chalmers machinery works, the Wire Works, and the Radiator factory, while the new cotton company, which is to build a factory at Lachine in the Spring or Summer, is materializing. In the east end, the Locomotive Works at Longue Pointe are to be extended at a cost of $1,000,000. In the neighborhood of the Angus shops a new town has grown up, and this will be added to during the Spring and Summer, for the C.P.R. cannot overtake its own orders at these shops, which are the largest and best equipped on the continent.

The Tallest Building.

Contracts have been awarded for the erection in New York City of what will be the tallest building in the world. This is the proposed new Singer building on Broadway, north of Liberty Street. It will require for the work 6,000 tons of structural steel. The building will have thirty-six regular floors, on top of which will be a dome including four floors, the fortieth floor being 550 feet above the curb. This is a part of the transformation of a city into an abode of cliff-dwellers. The building will be 625 feet high, the tallest skyscraper in the city, and will have wind anchors so that it may be firmly braced against every gale. The wind pressure, on account of the structure's great altitude, will be tremendous, and for that reason the building is to be literally tied to its foundations by an ingenious arrangement of steel rods. They will be three and a half inches in diameter, and descend for nearly fifty feet into the concrete which forms the caissons resting on solid rock eighty-five feet below the curb. The lowest rod has on the end of it a great anchor plate to which it is secured.

Dundas Weddings.

A happy event occurred on Feb. 6th at the home of Mr. Henry Bertram, at Dundas, senior member of the firm of John Bertram & Sons. The occasion was the marriage of his eldest daughter, Miss Jean Bertram to Dr. Alex. F. Pirie of Costa Rica. The ceremony was performed by Rev. S. H. Gray on the evening of an ideal Winter day, in the large drawing-room of the bride's home, being witnessed by one hundred guests. After a short stay in Dundas the newly married couple will set out for their future home in Costa Rica.

On Wednesday evening, Feb. 20th, an equally pleasing event took place, when Mr. James Bennett Bertram, youngest son of the late Mr. John Bertram, was married to Mary, elder daughter of the Hon. Thomas Bain. The Rev. S. H. Gray, of Knox Church, again officiated. The bridesmaid was Miss Helen Bain, the bride's sister, and Dr. W. T. Wilson acted as groomsman. Mr. and Mrs. Bertram left late in the evening for New York and Philadelphia, and on their return will occupy their house on Sydenham Street, Dundas.

Canadian Machinery joins in the good wishes of both the newly-married couples' many friends.

SITUATIONS WANTED

ENGINEER AND DRAUGHTSMAN (25), salt and salt making machinery; small marine and mill; technical training; requires position. A. M. Mere Heath, Davenham, Cheshire, England.

ASSISTANT GENERAL MANAGER, McGill graduate, desires change of position. Twelve years, practical experience along engineering, machine, foundry and boiler shop lines. Best of references. Address Box 25, CANADIAN MACHINERY, Toronto. [3]

SITUATIONS VACANT.

MOULDERS, Machinists, Blacksmiths, wanted immediately; state wages; steady job. Fletcher Mfg. Co., Limited, Glencoe, Ont.

MACHINERY WANTED.

WANTED—A second-hand power punch and shears; also a thread cutting machine. Hastings Wagon Co., Watford.

MACHINERY FOR SALE.

FOR SALE—Thoroughly equipped foundry and machine shop, containing all the requisite machinery and molding plant for carrying on first-class business; substantial new building; fifty yards from railway depot; one acre of ground; no opposition within 25 miles; town of 3,000 population; four large saw mills, the largest tannery in the Dominion, five steamboats, besides dozens of gasoline launches; the castings and repairs, etc., can be catered for; a first-class opportunity for good practical man; price, including castings, pig iron, etc., complete, $6,000; cost over $10,000; a snap. Address P. C. Marsh, Huntsville, Ont., or S. A. Hutchison, vendors' Solicitor, Huntsville.

GAS OR GASOLINE ENGINE—A 22 h.p. Fairbanks Morse engine, fitted for natural or artificial gas or gasoline; in good condition; used fifteen months. The MacGregor, Banwell Fence Co., Limited, Walkerville, Ont.

BELTING, RUBBER, CANVAS AND LEATHER, Hose, Packing, Blacksmith's and Mill Supplies at lowest prices. N. Smith, 138 York Street, Toronto. (2tf)

BUSINESS CHANCE.

WANTED—First-class foundry and machine company to buy interest in high-class patented machine, weighing seven tons and to manufacture, sell and instal same; this is a good proposition and will stand investigation. Apply Box 26, CANADIAN MACHINERY, Toronto.

WANTED—A machinist who can invest $1,000 in a machine and tool manufacturing company (charter applied for); profits ensure 10 per cent. on investment; position worth $2.50 per day to start. Address Iroquois Machine Works, Iroquois, Ont.

Requisition Order System

In what manner do you handle your orders for supplies? To our minds there is really but one satisfactory method and that is the new **C C Requisition System.** It won't cost you anything to hear more about it.

HERE'S WHAT IT DOES FOR YOU.

All orders, whether given to a visiting salesman, or sent by mail, of uniform size.

Perpetual separation of "Filled" from "Unfilled" orders.

No going through dead matter to find the live.

All orders filed alphabetically by purchasee.

Discourages substitutions.

Direct reference to any particular order, no matter how many orders purchasee is executing.

Makes buyer independent of invoices.

Prevents "padding" of orders.

Immediate identification of all boxes, barrels, crates, etc., on arrival.

Advises Receiving Clerk without showing quantities or prices.

Insures Accurate Count by Receiving Department.

APPRENTICES

can Bank Money in a few weeks.
Work will take but a few hours a week.
You Need no Money because we provide the capital.
We will start you in business by sending you your first stock without charge. The money from the sales of these will be used in buying new stock.
If you will try it, we will send supplies at once. Your profits are large.

IN ADDITION

there are bonus prizes: a watch is one of these bonuses.
Some boys and youths are earning a large sum each week as extra money.

CANADIAN AGENCY

Power Presses and Dies
Shearing Machines, Etc.

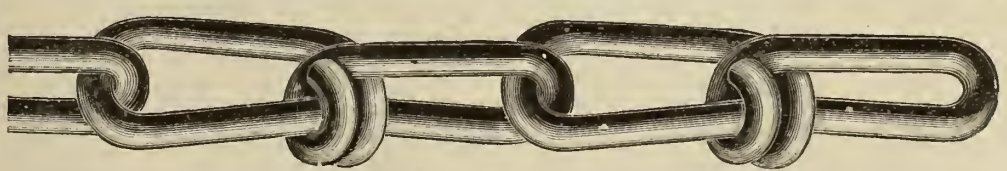
Wanted a first-class sole agent or representative working on commission to sell our manufactures in Canada. Revised Canadian Tariff should offer opportunities for good business.

We are the best and largest English Press manufacturers and prices are most reasonable.

Sole Agency given to person thoroughly understanding Presses, Dies and Sheet Metal Machinery.

J. RHODES & SONS, Limited, Grove Iron Works, WAKEFIELD, ENG.

GREENING'S STEEL WIRE CHAIN



If you are interested in Chains examine carefully the perfect mechanical construction of Greening's. It is the most perfect chain made. We make it in 13 sizes.

Correspondence solicited

We send cuts with table of breaking strain, samples, etc., upon request.

ELEVATOR BUCKETS

The largest stock in Canada is at your disposal at best prices.

MANUFACTURERS

Elevators and Conveyors

for handling grains, all ground substances, barrels and sacks, parcels, coal, crushed stone, etc.

SPECIAL OFFER—We have in stock over 150 Wood Split Pulleys, good as new, which only ran a few months, at greatly reduced prices. Bushings, any size.

WM. & J. G. GREEY

2 Church St., TORONTO

Manufacturere Flour, Oatmeal, Cereal Machinery, Grain Choppers, Mixing and Blending Machinery, Paint, Ink and Special Machinery, Power Transmission and Elevating Apparatue.

A Toronto Foundryman told our Mr. Beers, when he was recently talking with him, that the best Core Wash he ever had came from us—our No. 17.

Moneyback

That was our proposition to interest him. Here it is for you. Try a barrel; if not satisfactory, we will stand freight and cartage both ways, and you can have what you take out of the barrel (in proving it wrong) with our compliments. If you send it back, we will not come back at you by saying you did not know how to use it.

CHADWICK BROS.
BRASS FOUNDERS

Manufacturers of
Cast, Spun and Sheet Metal Goods; Brass, Copper and Aluminum Castings; Electro Plating; Brass and Nickel Railings; Brass Fittings of all kinds Engineers' and Plumbers' Brass Goods; All kinds of Brass Turnings; Bolts, Nuts, Screws, etc. Brass and Metal Goods of every description made to order; Gas and Gasoline Engine Supplies.

CHADWICK BROS.
Factory: HAMILTON, ONT. (Oak Ave.)

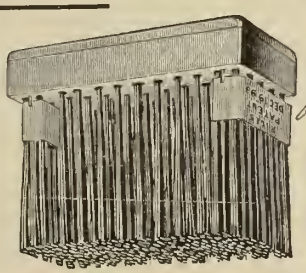
"PERFECTO" LIQUID CORE COMPOUND

Points of Merit:

First: Excellent binding properties—quick bakage.
Second: No evaporation—no gathering of moisture.
Third: Freeness from gases—non-blowing qualities.
Fourth: All grades reasonably free from smoke and smell—some are SMOKELESS.
Fifth: Easy pealing of cores.
Sixth: No scabbing on casting—no fusing—no hot metal eating into cores ever occurs where our compound is used.
Seventh: Graded to suit YOUR foundry conditions.
Eighth: Compounded from best known ingredients and under most careful and skilful direction, thereby ensuring uniform quality.

Sole Agents:

THE HAMILTON FACING MILL CO., Limited
FOUNDRY OUTFITTERS
HAMILTON, Ontario. MONTREAL, Quebec.



If you have not used this brush, order a sample lot to be forwarded with next shipment.

Rice's Patent Bridled Casting Brush

Casting brushes go to pieces because the end wires break off. Unhindered vibration causes this breaking. Our Patent Hinged Bridle prevents the vibration and the consequent breaking, making the brush last twice as long as the ordinary casting brush. The bridle is hinged to move freely so that the brush retains its flexibility.

NOTE.—We have recently acquired rights to the patents on this brush and are now the SOLE MANUFACTURERS.

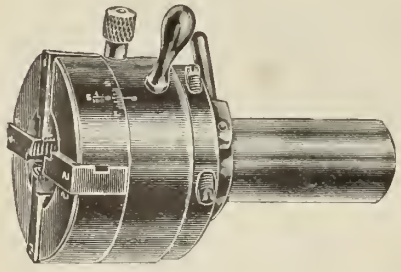
Have you Large Quantities of Duplicate Threads to Cut? IF SO, YOU NEED OUR



Geometric Self-Opening Screw-Cutting Die Heads

After you have used them a short time you will wonder how you ever got along without them, as they save at least one-half the time required in cutting threads with solid dies,

These Die Heads are adapted for cutting any size or style of thread, right or left hand, and the length of thread is limited only by the travel of the turret slide. They open automatically at the end of the cut, thus averting danger of spoiling work and saving the time usually wasted in running back over finished threads.

We would like to send you our catalogue.

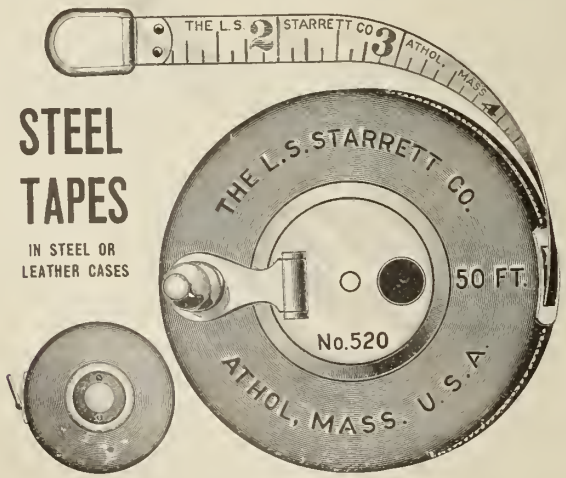
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES

IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this:

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures, denoting feet, allow the graduation line under each to be plainly visible, instead of being obliterated by the usual larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

Technical Books

Modern Machine Shop Tools

Their Construction, Operation and Manipulation, including both Hand and Machine Tools.

By W. H. VANDERVOORT, M.E.

Large 8vo. *555 Pages* *673 Illustrations*
Bound in Cloth *Price* ***$4.00***

An entirely new and fully illustrated work treating the subject of ***Modern Machine Shop Tools*** in a concise and comprehensive manner. The work is logically arranged; the various hand and machine tools being grouped into classes, and description of each is given in proportion to their relative importance. The illustrations represent the very latest tools and methods, all of which are clearly described. Each tool is considered from the following points: *First*—Its construction, with hints as to its manufacture. *Second*—Its operation, proper manipulation and care. *Third*—Numerous examples of work performed.

Compressed Air

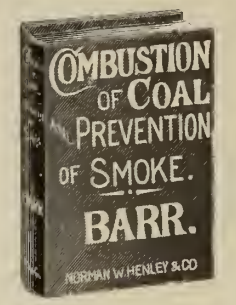
Its Production, Uses and Applications

By GARDNER D. HISCOX, M.E.

Large Octavo *820 Pages* *545 Illustrations*
Bound in Cloth *Price* ***$5.00***

A complete treatise on the subject of compressed air, comprising its physical and operative properties from a vacuum to its liquid form. Its thermo-dynamics, compression, transmission, expansion, and its uses for power purposes in engineering, mining and manufacturing work. Air compressors, air motors, air tools, air blasts for cleaning and painting. The sand blasts, air lifts for pumping water, oils and acids, submarine work, aeration of water, railway appliances and propulsion. The air brake, pneumatic tube transmission, refrigeration and cold rooms. The hygiene of compressed air, its liquefaction and phenomena, including forty tables of the physical properties of air, its compression, expansion, and volumes required for various kinds of work, and a list of patents on compressed air from 1875 to date.

These forty air tables cover most of the relations of our atmosphere and its contained moisture in its various conditions, from a vacuum to its highest pressure, and its power for work; its final liquefaction and the phenomena of extreme cold,



A Catechism on the

Combustion of Coal

and the Prevention of Smoke

A practical treatise for Engineers, Firemen and all others interested in Fuel Economy and the Suppression of Smoke from Stationary Steam Boiler Furnaces and from Locomotives.

By WILLIAM M. BARR, M.E.
Author of "Boilers and Furnaces," etc.

One Volume *350 Pages* *85 Engravings*
Price ***$1.50***

This book has been prepared with special reference to the generation of heat by the combustion of the common fuels found in the United States, and deals particularly with the conditions necessary to the economic and smokeless combustion of bituminous coals in ***Stationary and Locomotive Steam Boilers.***

The method of treatment consists of a systematic and progressive series of questions covering every detail relating to the combustion of fuels for the purpose of generating heat; the answers to these questions are practical and direct, and to better illustrate certain subjects that could not otherwise be made clear, eighty-five engravings have been especially prepared which admirably supplement the answers to which they belong.

Dies

Their Construction and Use for the Modern Working of Sheet Metals

By JOSEPH V. WOODWORTH

384 Pages *Bound in Cloth* *505 Illustrations*
Price ***$3.00***

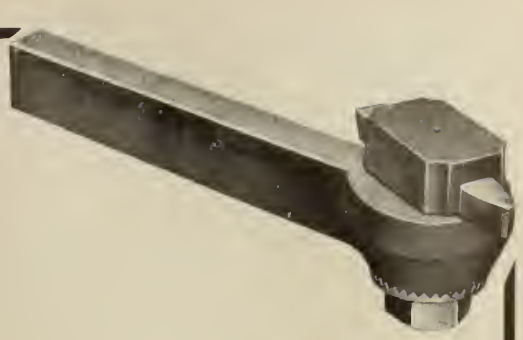
This work is a complete treatise upon the Designing, Construction and Use of Tools, Fixtures and Devices, together with the manner in which they should be used in the Power Press for the cheap and rapid production of the great variety of Sheet Metal articles now in use. It is designed as a guide to the production of Sheet Metal parts at the minimum of cost with the maximum of output. The hardening and tempering of Press Tools and the classes of work which may be produced to the best advantage by the use of Dies in the Power Press are fully treated.

The book was written by a skilled and successful workman, and is one that Die-makers, Machinists, Tool-makers and other metal-workers connot afford to be without.

Address TECHNICAL BOOK DEPT.

The MacLean Publishing Company, Limited, Toronto

First Cost is the Last Thing to Consider, if You Want Tool Holders That Earn Money.



The United States Planer Tools will save their cost in less than a month.

The wide range of work these tools are capable of being used for can only be learned by actual use.

The shank is of steel, drop forged, and case-hardened after being finished.

As the shank is very rigid, larger sized cutters are used than in other tools, thus permitting cuts as heavy as the machine will stand.

A support for the cutter extends all around the head of the shank. This does not interfere with under cutting, or getting close into a corner.

By means of the large number of serrations in washer and shank, a very close adjustment can be made and retained when cutter is removed for grinding, thus effecting a saving in time necessary to re-adjust other makes of similar tools.

GISHOLT TOOLS

IN purchasing machine tools one of the vital questions to be considered is the *reputation* of the builders and their *experience* in building machines for a certain class of work. For twenty years we have been specializing on machines for the rapid and economical production of work requiring boring, turning and facing. Gisholt Lathes and Boring Mills are recognized as standard machines for this class of work. They are time and labor saving tools, because they are powerful enough to stand the strains of many cutters working at the same time and because they have the most up-to-date appliances for the quick and accurate handling of the machine itself.

Modern Canadian Manufacturing Plants.

ARTICLE XXII.—Plant of Sheldons Limited.

SOME four years ago the partnership company of Sheldon & Sheldon was organized to buy and take over the plant and machinery and equipment of the McEachren Heating and Ventilating Company of Galt. The old plant was added to in the way of machine tools and other devices, and the business was increased in every possible direction. For three years under this name the company was operated, when it was deemed advisable to organize a stock company, under the title of "Sheldons, Limited." A Dominion charter was obtained, and officers were appointed as follows:

President, W. D. Sheldon.
Vice-president, S. R. Sheldon.
Sec-treasurer, J. P. Stewart.

Immediately on the organization of this new company the extensions and additions contemplated were entered upon, and in the course of from two to three months the buildings were erected complete.

This company was organized with a capital stock of $200,000, a good part of this being new capital put into the company for the erection of additions and the installation of new machinery. Since that time the company's business has increased very materially, and they have at present on their books orders for some of the largest fans which have yet been used in this country, among them being orders for wheels running from 14 to 18 feet in diameter.

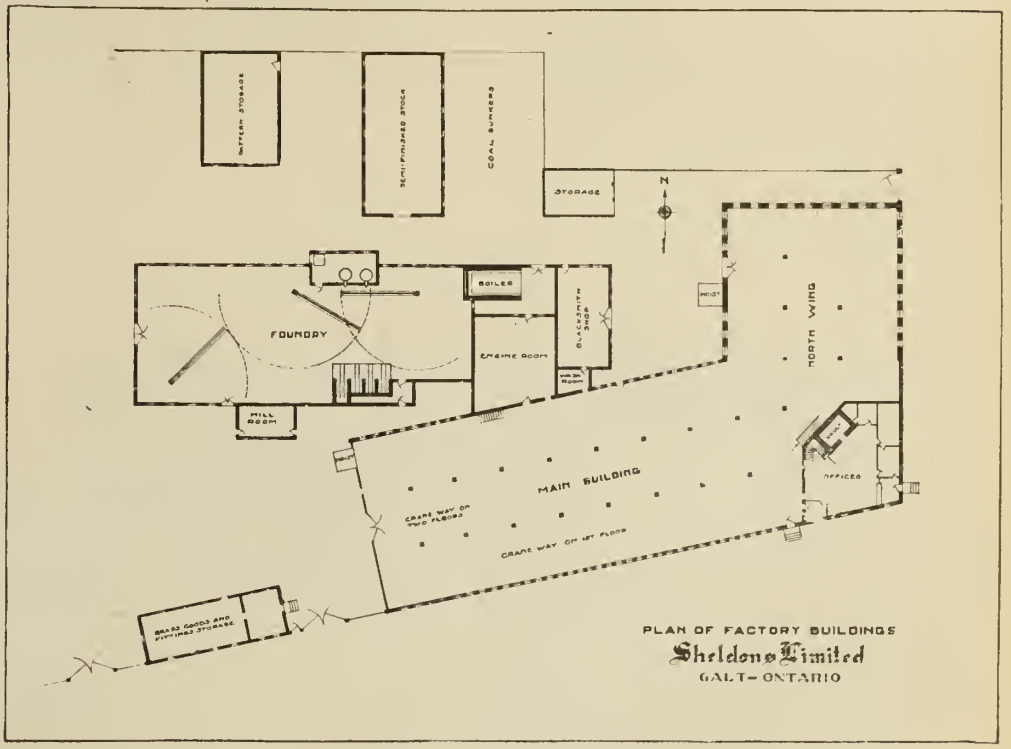
General Lay-out.

The works are situated on the corner of West Main and Cedar streets. The main factory is built in the form of an L, the short leg of the L running north and south on West Main street, and the new extension, which was erected in 1906, extending in a westerly direction on Cedar street, on the street line.

The engine and boiler room and electric light equipment are situated in a brick building about midway up the length of the new extension on the north side. On the west side of this boiler and engine room extends the foundry.

The machine shop, or main building, is built in two floors, the ceilings having a height of 15 feet. Both floors are served by travelling cranes. The size of the main building is, on the short leg of the L, about 120 x 65 feet, two floors, and the long leg about 140 x 65 feet. The foundry is about 45 feet in width by about 120 feet long, and is served with a jib crane for handling the iron.

The offices are situated in the corner of the main building. The main offices are on the ground floor, with the draughting room above. These are divided into private and general offices, and are fitted with modern heating and sanitary arrangements, and are equipped with vaults for correspondence, drawings, etc.



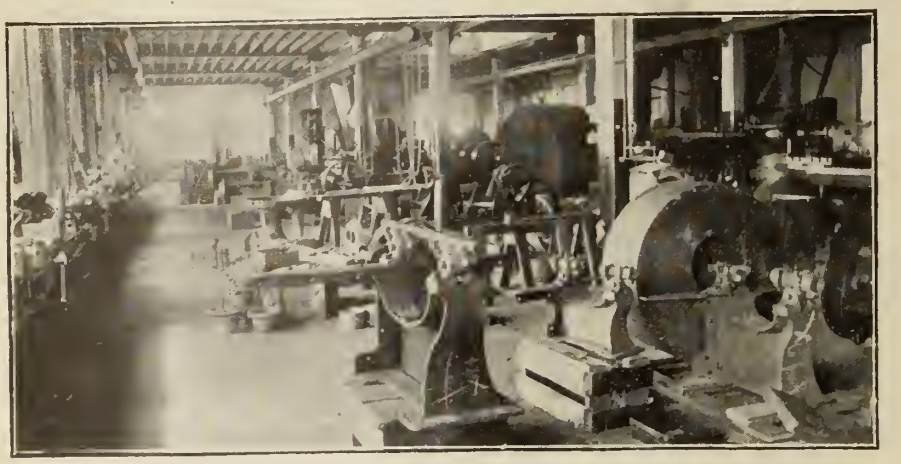
Plan of Plant—Sheldons Ltd., Galt.

Manufacture of Heaters.

In the north wing of the main building are manufactured the heaters used in connection with the fan system of heating and ventilating. This department employs about ten men, and their entire time is spent in constructing and testing these coils. The pipe is cut with a high speed rotary cutter, with automatic measuring attachment, and is threaded by a semi-automatic, double-head pipe-threading machine. The elbows on the standing pipes of these heaters are put on by a special machine made by Sheldons, Limited, themselves, which does the work much better and far more quickly than it could be done by the old method of hand connection. The bases are all constructed on slatted floors built over concrete basins, and as each section is completed it is tested to a hydrostatic pressure of 150 pounds per square inch, and made tight under this pressure.

Immediately adjoining this department is the main room in which is done all the machine work on the castings as they come from the foundry. In this department are seen lathes of different sizes, as manufactured by the Mac-Gregor-Gourlay Co., Galt; R. McDougall Co., Galt; Bertram & Son, Dundas, Ont. These lathes are all operated at high speed, and utilize high speed steel cut-

ters. The new additions to the machine shop and equipment this year comprise: A large boring mill, made by Bertram & Son, Dundas, for boring out engine frames and cylinders; one large vertical boring mill for turning up engine work and fan parts; one key-seating



View of Erecting Floor; Sheldons Ltd., Galt.

machine for cutting necessary key ways in the fan spiders; two radial drills of the latest design; one large riveting and punching machine, and two large punching and shearing machines, made by the London Machine Tool Company, Hamilton. They are also installing a large Landis grinder, and have recently ordered a new shaper of one of the largest sizes made by MacGregor-Gourlay Company, and a large radial drill, of special make.

They also have a large MacGregor-Gourlay planer, universal milling machine, special boring and tapping machine for bases, a large pipe cutting and threading machine for working on pipe up to six or eight inch, and about six small and medium-sized drill presses.

The heavy machines, such as the horizontal boring mill, vertical boring mill, planer, large lathes and Landis grinder will be situated in the centre bay of the main buiding, which is served by a travelling crane.

Tool Room.

To the machine shop has also been added a tool-making equipment for supplying all the necessary jigs and special tools for the operation of the above-mentioned machines.

The tool making is done on the north side of the main building, and they are at present busy in putting up and partitioning off this department, and are about to install a tool-checking system for keeping track of all the jigs and tools which are used.

Erecting Floors.

The main working floor is situated on side of the main building, and they are entire length. On this floor are fitted all the engines, forges, fans and fan wheels, bearings and steam specialties. This bay is also served by a travelling crane for the convenience of handling and working on the large engine frames, used for operating some of the heavy fans. In the centre of this floor is situated a large testing plate built upon solid concrete, which is constructed right down to bed rock. This is served with steam from the boiler, and is used for testing and experimenting with all engines, every one of which is operated in the shop for at least two days, under load; and while under operation the speed, power and other particulars are noted. The cards taken from these engines are kept on record.

In the machine and fitting department, which occupies the entire ground floor of the main building and the new wing, are employed in the neighborhood of fifty-five men, consisting of machine operators, fitters, and their helpers.

Sheet Metal and Pattern Department.

The upstairs of the main building and the north wing is occupied by a pattern department, the heavy sheet metal working department, and the galvanized iron department.

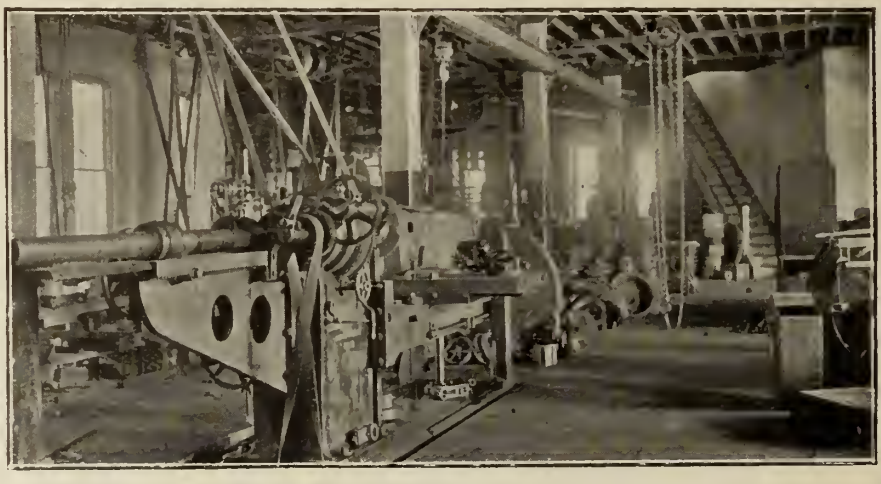
The pattern room is fitted with the necessary wood working machinery required for pattern making. In the pattern department are employed six men.

The sheet metal department is fitted with punches, rotary slitting shears, brakes, large slitting shear for cutting a ten-foot sheet in one operation, and other special tools and jigs for the manufacture and construction of the steel shells of the fans. This department is equipped to work all sheet metals up to and including plate of ¼-inch in thickness.

The large fan wheels are also constructed in this department, and are made on special jigs constructed for the purpose. The wheels, when constructed, are conveyed to the testing shaft on the lower floor, where they are given a running balance, which is the only practical method of balancing, so as to ensure continuous operation without-creating undue noise and resistance. This department employs in the neighborhood of thirty men.

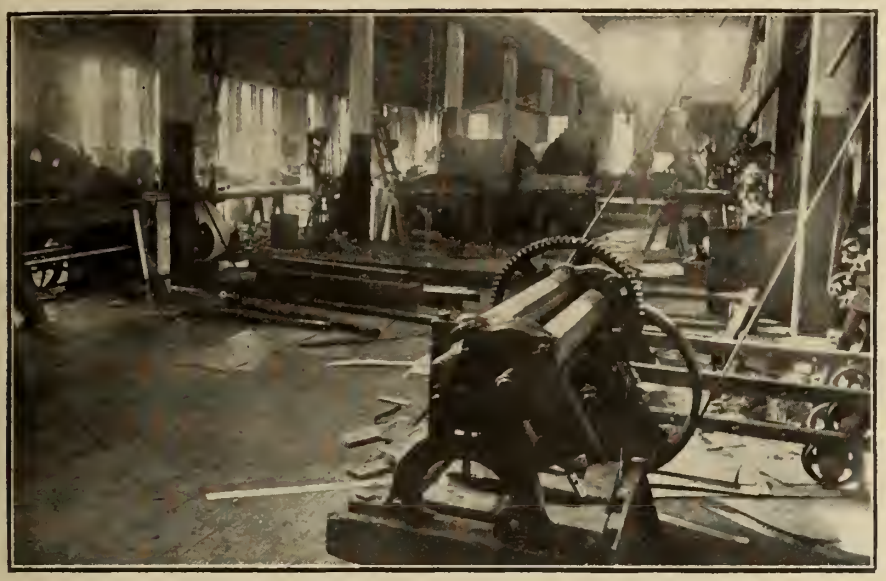
In this department is made and constructed all the galvanized iron work used in the erection and equipment of the heating systems. Nearly every installation will include from 1,000 lbs. upwards of this light galvanized iron work. Employed in this manner are from fifteen to twenty men, with their helpers.

To the north of the main building is



A Corner in the Machine Shop; Sheldons Ltd., Galt.

the boiler and engine room. This part is entirely new, and consists of a 75 h.p. Wheelock engine and 115 h.p. boiler, both made by the Goldie & McCulloch Co., Galt. The main driving shaft is equipped with Chapman double ball-bearings. In the engine room is also situated the heating system, consisting of a 5,000-ft. heater, 140-inch fan and direct connected 7x10 engine. This heating system was made by Sheldons themselves, and installed complete. The electric lighting system for the factory is also situated in the engine room, and consists of a 35 kilowatt Canadian Westinghouse generator. This generator will shortly be operated by one of Sheldons' own make of automatic horizontal side crank engines. The switch board is also of the Canadian Westinghouse make, and is complete with switches for all departments.

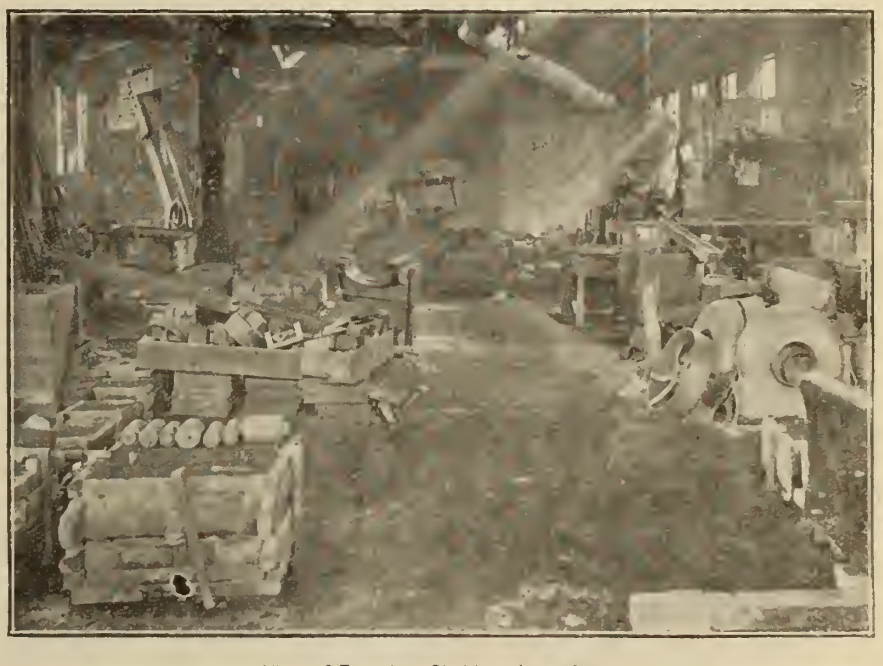


View of Sheet Metal Department; Sheldons Ltd., Galt.

The Foundry.

The foundry building is a one-floor building about 45-ft. wide and 120-ft. long. In this department are employed twenty or twenty-five moulders with the necessary laborers to help them. In the foundry a special device is used for chilling the tread of the wheels used in the construction of brick and lumber cars, of which this firm makes a large quantity. These chills consist of collapsible cast iron frames which fit around the wheel mould between the upper and lower half of the sand impression. The foundry equipment includes three large core ovens, fitted with steel doors and down draft combustion chambers. These ovens are of the firm's own design and construction.

The cupola used in the foundry is made by the firm, is 30 inches in diameter inside the lining, and has a maximum melting capacity of five tons per hour. The usual run in the foundry is about two and a half tons of iron per day. The cupola is situated in a specially constructed room, which is entirely fire-proof, the charging floor being made entirely of steel. The walls are solid 12-inch brick, and the roof is made of steel and galvanized iron.



View of Foundry; Sheldons Ltd., Galt.

The coke and iron is conveyed from the yard to the charging floor by means of an elevator, made by the Otis-Fensom Elevator Co., of Hamilton. In the yard are several store houses, erected for the storage of valves and pipe fittings, for steel plates, channels, I-beams and angle iron. There is a special house erected for the storage of finished and semi-finished machines, and also a large metal clad building for the storage of patterns. There is a blacksmith shop, about 25 x 40 feet, in which are employed two blacksmiths.

The shipping is at present all done on heavy trucks, but there is every indication of their obtaining shortly switch connections and inter-switch facilities with the C.P.R. and the Grand Trunk.

The buildings are constructed of brick, with wooden posts and 3-inch flooring. There is a large area of glass surface, and the roof is of the Monitor type, which gives an extra supply of light on the upper floor.

They have installed the Dey time check system, that is, they use the Dey time clock, and the men ring in their time as they arrive at and leave the works. They have also a cost system installed in the factory, by which they keep track of the time each man spends on certain work, every order passing through the shop with an order number, which the workman puts on the card issued to him for that purpose, and when the machine is completed these order numbers and cards are gathered from the shop and checked over by the superintendent, then passed into the office, where the cost is made up. These orders are checked every day.

PERSONAL MENTION

E. F. Valiquet, superintendent of J. W. Harris Co., excavators, Montreal, was born in 1865 at St. Martin, Que. In 1877 he came to Montreal and served his time as machinist in Miller Bros. and Toms' factory. He then went to the United States, where he stayed about five years, coming back to Montreal in 1892, where he accepted the position of

E. F. VALIQUET, MONTREAL.

chief engineer for W. Rutherford & Sons. He was foreman of Lymburner & Mathews, also for Darling Bros.' machine shops, Montreal, and the Canadian Portland Cement Co., of Marlbank, Ont. The abattoir at the Montreal stock yards was erected under his supervision. Mr. Valiquet has also held the position of chief engineer of the Locomotive and Machine Co., Longue Point, (Montreal), Que., and head millwright for the Weber Elevator, and his present position with the J. W. Harris Co., Ltd., Montreal, where he has been for the past two years. He is at present instructor for the Association of Stationary Engineers Montreal; boiler inspector for the province of Quebec, and provincial examiner for engineers.

Mr. J. Conlin, first vice-president of the International Machinists' Union, was in Toronto on March 17th.

Mr. Chas. McDonald, manager of the St. John Iron Works, St. John, N.B., left for England on March 15th.

Mr. Lindsay Malcolm, M.A., formerly of Guelph, and a gold medalist of Queen's University, has been appointed city engineer, of Stratford, at a salary of $1,300.

Mr. Wm. Banks, who is leaving for Toronto, where he will enter business for himself, was presented with a gold watch and address by the employes of the Cockshutt plough works, Brantford, with which he has been connected for many years.

The engagement of Mr. Roland W. Robb, of the Robb Engineering Co., Amherst, N.S., to Miss Mabel Pugsley, daughter of Mr. Robert Pugsley, is announced.

Mr. W. Risdon, manager of the Erie Iron Works, St. Thomas, has sold out his interests in the company to Mr. George Spackman, western representative of the Massey-Harris Co.

It is reported in Sydney that Mr. F. P. Jones, general manager of the Dominion Iron and Steel Co., will shortly resign, and be succeeded by Mr. C. S. Cameron, at present comptroller of the company.

Mr. Harry A. Norton, of A. O. Norton, Boston, Mass., who has just returned from a trip round the world in the interests of Norton jacks, has again sailed for Europe, and will be away three months.

Mr. W. C. Groening, superintendent of the Pere Marquette shops in St. Thomas, has been transferred to Grand Rapids, Mich. His successor is Mr. F. C. Pickers, formerly shop fareman at Grand Rapids.

Mr. G. J. Bury, Winnipeg, general manager of the western lines of the C. P.R., has been offered the position of general manager of the Chicago, Rock Island and Pacific Railroad Company, at a salary of $30,000.

Mr. Geo. T. Moss has severed his connection with the Canada Screw Factory, Hamilton, going to the Canadian Westinghouse Co. Before leaving he was presented with a gold locket by the employes of the screw factory.

Mr. Chas. Spellman, a well-known young traveler for the Canada Forge Works, Welland, Ont., was caught by some machinery while in the works on March 22, and almost instantly killed. His home was in Titusville, Pa.,

The employes of the R. H. Smith saw works, St. Catharines, on March 15th presented Mr. H. A. Blair with a fob and locket on the occasion of his leaving the assistant managership of the firm to take a similar position with the R. Hoe Saw Works, New York.

Mr. R. F. Harrison, of London, Eng., is in Montreal to take over the sales management of the F. W. Reddaway Belting Co. Mr. Harrison comes here with a well-established record in the Old Country, and he will have complete control of the Canadian business.

The office staff of the Goold-Shapley-Muir Co., Brantford, on March 4th presented Mr. W. J. Craig with an umbrella, and Mrs. Craig with a cake dish, on the occasion of Mr. Craig's retiring from the firm with the removal of the bee-keepers' supply branch to Ottawa.

Harry C. Hoefinghoff, president of the Bickford Drill & Tool Co., Cincinnati, Ohio, died on March 2nd, after an operation for appendicitis. Mr. Hoefinghoff was born in Cincinnati in 1871, and was one of the most prominent young men engaged in the manufacture of machine tools in the country. His affability won for him a wide circle of friends, among both his business associates and fellow-townsmen, and he was considered one of the most promising young business men of Cincinnati. A wife and three children survive.

Mr. J. K. Macdonald, for many years in business as a machinist at 318 Craig street west, Montreal, died on March 11th, at the age of 66. He was a native of Campbelltown, Scotland, and came to Montreal forty-five years ago. He leaves a widow, three sons, and three daughters.

At the annual convention of the American Railway Engineering and Maintenance of Way Association at Chicago, lately, William McNab, assistant engineer of the Grand Trunk Railway, was elected vice-president. This means that next year he will become the president, and that probably the next annual convention will be held in Montreal.

Mr. John G. Sullivan, who has been assistant chief engineer on the Panama canal for over a year, has been appointed superintendent of construction by the Canadian Pacific Railway for all lines east of Fort William, with his office in Toronto. For a number of years Mr. Sullivan had charge of construction for the C.P.R. in the west, and then left that position to go to Panama. He will enter upon his new work immediately.

Mr. John D. Maclennan, C.E., a Canadian engineer, who has distinguished himself in the United States, died suddenly in New York on Feb. 26th. He

W. J. FRANCIS
of the Dominion Bridge and Construction Co.
Winner of the Gzowski Medal.

was the eldest son of Mr. Roderick Maclennan, C.E., Toronto. He began his engineering career with the C.P.R. during its construction, and on the completion of the work went to the United States, where he built the Florida Coast Railway. Later he had charge of the construction of the filtration plant for the waterworks of Washington, and other public works of importance, including the investigation of the Philadelphia filtration system. Mr. Maclennan was in his 51st year.

Producer Gas vs. Niagara Power

By Kendall Greenwood, B.A.Sc.

Electric power at the prices quoted by the Ontario Power Commission is conceded to be probably the cheapest form of energy for manufacturing obtainable at the present time.

This is only true, however, within the district within a radius of 50 miles of the city of Hamilton. Outside this radius there is a source of energy considerably cheaper than Niagara power and that is producer gas power.

Gas power is becoming more and more a factor in the generation of electric energy. There are at the present time a great many producer gas plants in operation. Gas engine makers are working double shifts in order to keep up with their orders for gas plants.

With producer gas it is possible to generate electric power for driving motors in factories, lighting and other purposes, and to utilize the waste heat from the gas engine exhaust to raise steam for heating and other uses.

Suppose a manufacturer has a factory and that he requires a fairly steady load of 100 h.p. for 10 hours for 300 days per year; and that he has decided to use motors and electric lighting. what will be his best source of energy, and what will it cost ?

The manufacturer goes to the city of Toronto and finds that Niagara power will cost as follows, for the above mentioned load :

.35 cent per horse-power per hour as a meter rate.

.40 cent per horse-power per hour flat rate whether he uses the power or not.

Total, .75 cent per horse-power hour.

His power would therefore cost for 300,000 horse-power hours at .75 cent, $2,250.

In addition to this there are the fixed charges and maintenance on his motor equipment. This will be the same in either case and has not therefore been taken into consideration.

The power user then goes to the producer gas manufacturer and finds that a 100 horse-power suction gas engine and producer plant will cost installed $5,700
and an electric generator, etc... 2,300

Total $8,000

The fixed charges for this plant will be as follows :

Interest, at 6 per cent.	$480
Depreciation, engine, 7 per cent.	294
" producer, 4 per cent.	54
" electric generator 10 per cent.	230
Labor (one man, $50 month)	600
Repairs, etc.	100
Total	$1,758

The fuel and oil charges will be as follows :

A suction gas plant will burn a pound of good pea anthracite per horse-power per hour when running at or near full load; and at half load the consumption will be about 1.5 lbs. Pea anthracite costs in Toronto about $4.20 per ton.

Fuel used may be calculated as follows :

$$\frac{\text{H.P. Hrs. Days Lbs.}}{2{,}000} = \frac{100 \times 10 \times 300 \times 1}{2{,}000} = \text{eq. 150 tons per year.}$$

Allowing 3 lbs. for stand-by losses per hour we have,

$$\frac{3 \times 14 \times 300}{2{,}000} = \text{eq. 6 tons per annum.}$$

Total fuel will then be 156 tons at $4.20	$655
Oil and waste, etc., will cost ...	120
	$775

Total cost for power per annum :

Fixed charges on plant ...	$1,758
Fuel, oil and waste, etc. ...	775
Total	$2,533

Total cost per horse-power per annum	$25.33

Reducing to same basis as rates for Niagara power we have, for 300,000 horse-power hours :

Fixed charged per h.p. hour...	.586 cent
Fuel, charges per h.p. hour...	.258 cent
Total	.844 cent

Hence, we find that producer gas power only costs less than one-tenth of one cent more per horse-power hour than Niagara power for the same plant capacity.

While the cost of power in a one hundred horse-power gas plant is very slightly higher than Niagara power in Toronto there are advantages to be gained from the use of producer gas which would more than offset the extra cost.

Niagara power is as yet very much too expensive to use as a source of heat for buildings ; consequently a user of Niagara power has to use coal directly for heating purposes for six months in the year.

In a 100 h.p. gas plant there are about 3,500 b.t.u. available per pound of coal burned, or 350,000 b.t.u. per hour in the exhaust.

By exhausting this heat through the tubes of an ordinary steam boiler it is possible, assuming an efficiency of 60 per cent., to raise 216 pounds of water to steam at 70 pounds boiler pressure per hour. That is, there are available in the exhaust gases from the 100 h.p. gas engine, 7 boiler horse-power during the time that the engine is running 10 hours per day.

By arranging this boiler with a grate, steam may be kept up during the night by burning coal in the usual manner.

Thus, it is possible to recover 7 per cent. of the capacity of the plant and to save $175 per year, and so reduce the fuel cost of the power to the comparatively small amount of $600. The total cost per horse-power per annum is thus reduced to $23.58.

The writer has charged the whole of the engineer's time to the cost of power. It is quite fair that a patron of this time should be charged to other work, as it has been found that about three hours per day is sufficient to attend to the whole plant in medium-sized installations.

It can now be easily seen that producer gas can easily compete with hydro-electric power in all portions of the country, with the exception of the Niagara peninsula and vicinity.

APPOINT AGENTS IN BRITISH COLUMBIA.

It will be of interest to the trade in British Columbia to know that John Millen & Son, Ltd., Montreal, have appointed Messrs. A. G. Urquhart & Co., DeBeck block, 336 Hastings St., Vancouver, B.C., as their agents for British Columbia. Urquhart & Co. will carry a stock of supplies and accessories most in demand by the automobile and motor boat trade, as well as a stock of bicycles and bicycle sundries.

OLD AGE DEFIED.

THE Hungarian chemist Brunn, claims to have discovered a liquid chemical compound which renders certain kinds of matter proof against the effects of time. He asserts that it doubles the density of nearly every kind of stone and renders it water proof. It imparts to all metals qualities which defy oxygen and rust. The professor says that while traveling in Greeee some twenty-five years ago, he noticed that the mortar in stones of ruins which were known to be over 2,000 years old, was as hard, fresh, and tenacious as if it had been made only a year. He secured a piece of mortar and has been working on it ever since until now, when he says, he has discovered the secret. His discovery, he claims, will, at least double the life of metal exposed to the air, such as bridges, railroads, vessels, and tanks

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

A FITTING EDUCATION FOR THE MECHANIC.

ONE of the big problems in the manufacturing industry of the present day is that of securing well trained mechanics. Direct evidence of the seriousness of this problem is the interest which so many large firms and also associations and societies are taking in the question of apprenticeship courses and technical training. Skilled mechanics cannot be produced within a day's notice. They must get a thorough training in some way or another; and the ever increasing demand for these men in Canada, as the country expands, makes the problem, as to how best to train young men and boys in mechanical lines to fill positions as necessity demands, a most vital one to the manufacturer.

It is impossible to draw a distinct line between the engineer and the mechanic. Looking at the question broadly, it might be said that the engineer is a mechanic, who, because of greater ability or because of closer application to work, has reached the higher rung of the ladder of success in mechanics; but it is true that frequently the best of engineers are not trained mechanics, and frequently the best and brightest of mechanics would make very poor engineers. The good engineer must be something more than a mechanic. The relative merits of college men and practically trained men as engineers are often a matter for discussion; but this cannot be discussed to advantage except in relation to some one particular case.

The question of training for mechanics, however, is apart from this. Because of the great advances in methods of manufacture during recent years, the good mechanic of to-day requires a better general education than in years gone by, and also a more complete technical training. In metal working industries the technical training required is along the line of mathematics used in simple designing, in elementary mechanics, and in mechanical drawing, together with information of a general nature concerning the line of work to be followed, which should deal particularly with things which cannot be picked up in the shop.

Quite a large number of firms in Canada and the United States have apprenticeship courses, which include a technical as well as practical training; and this certainly appears to be one of the best methods of solving this problem. At the same time the Government, civic authorities, boards of trade, and associations, such as the Canadian Manufacturers' Association, should do all in their power o promote the cause of technical education in Canada; and if this matter is gone into with enthusiasm we will, in time, have as complete a system in Canada as exists in Germany, and other countries. This will not only elevate the plane of the mechanic, but will assist in making the product of Canadian manufacturers equal to that of manufacturers in any country. It is gratifying to see that this question is receiving very considerable attention from different organizations in Canada, and also from the Government and civic authorities.

At the last meeting of the Central Railway and Engineering Club of Canada, held in Toronto in the latter part of March, the subject of technical education was discussed; only a short time ago the technical committee of the Canadian Manufacturers' Association made a personal visit to the one technical school in Toronto for information regarding the conduct of the work there; and within the last few months this subject has been discussed and rediscussed in numerous mechanical societies in the United States. This shows that extraordinary interest is being taken in this subject at the present time; and it is to be hoped that the results will be worthy of the efforts which are being put forth.

A plan to further the cause of technical education is being tried by Mr. J. Dove-Smith, of Standard Bearings, Limited, Niagara Falls, Ont. He has arranged with the Collegiate Institute there, to include a course in the plant of the Standard Bearings as part of the regular curriculum of the Collegiate. The enthusiasm with which this has been taken up by the students at the Collegiate is ample evidence of the success of this idea in this instance at any rate; and there seems no reason that similar courses should not be arranged for in other towns and

cities in Canada This idea should certainly have good results, as it will serve to acquaint young men and boys with the many attractive features in mechanics; and the minds of those boys who would make a success at such work are set in the right direction. Surely the originator of this idea is to be congratulated.

THE ENGINEER AND THE STEAM TURBINE.

THERE is an idea prevalent among engineers that anyone with a certificate can turn on steam and run a turbine outfit. The notion probably arises from the known good behaviour of many turbines in use ; and turbines in running order certainly give little trouble in themselves. But this very desirable feature is assured only by unfailing vigilance. Little matters that would pass without the least thought or apprehension in a pump, send the engineers on watch in a turbine ship all on edge.

Tradition says that the night before the "Ark" put to sea Noah, who was anxious about the refrigerator and condensed water for the animals, called up his chief engineer for sailing orders, and amongst other general instructions gave expression to the classic motto " and don't get caught." With turbine machinery more than ever the marine engineer recognizes this as his golden rule. Coal bills, side commissions, bad temper, talking back to the shore captain, anything, almost, will be forgiven him, but at sea the engines must not stop. Now the things that stop the turbines accidentally are measured in thousandths of an inch. Old line engineers do not at once recognize this limited clearance, because they do not see the necessity. The necessity is there, however. The great attention paid to shades of wear in the thrust block, to sounding the "dummies" and "the finger pieces" are all things that cannot be done with the turbine running, but on which good running depends, for the expansion when heating up takes effect from the "adjustment block" or thrust block and is cumulative at the far end of the turbine rotor, where the inter blade clearance will be correspondingly exaggerated. So the first row of blades is adjusted by feeling to .002 inch—this further down the expansion runs up to nearly .10 inch—and puts a limit to the length of a drum or rotor, apart from what bearing will carry.

Then a hot bearing on a crank shaft will call for attention, but it cannot in the ordinary course of events work the destruction that hot bearings are capable of in a turbine, because in the long and narrow clearance between rotor and casing the slightest distortion arising from a hot journal would let thousands of blades into trouble. To safeguard this contingency, they have cooled and forced lubrication, but the very ease of such a device is a trap for the ordinary man. It fails when least expected ; and because it fails only once in a great while, we get tired expecting it—every ten minutes—but to get caught means—other troubles.

In two years time the Mediterranean service between Marseilles and Alexandria will see the commission of four large turbiners now in the yards, and already the superintendent is looking about for careful men with turbine experience. The chief engineer of a 12-knot freighter, when he heard it mentioned, laughed and said that in two years time the service would be full of turbine men, and would-be turbine men, that any good company could have an unlimited choice of. But marine superintendents in a position to know take a different view. They seem to think that as turbine steamships multiply the best men will be at a premium. The necessity of careful and resourceful men becoming more and more apparent, managers will feel that not every chief with an "extra first" certificate is an available man for turbines. From the owners' point of view a chief engineer's value is gauged not by the troubles he has gone through, but by all those he has avoided.

In the next place good "chiefs" and "seconds" knowing others to have gone from reciprocating ships to turbiners will not be willing to take a subordinate position for the sake of a little experience that they may underrate. To them it will look like winning their way up again. There is also a somewhat short limit to the promotion of the men now serving in turbine ships, for it is not every engineer, no matter what his experience may be, who is capable of taking charge of men and machinery in a modern passenger ship. It may be quite a generation before supply and demand gets on even terms again, as far as the engineer and the marine turbine are concerned. Meanwhile plums will go to those far sighted individuals who most adapt themselves to the new conditions and who are prepared to sacrifice present positions to qualify for new responsibilities.

These remarks apply in a much less degree to the land turbine—in central station work the turbine is not subjected to the severe trying-out process of machinery at sea—nor could stationary engineers, if transplanted, be expected to successfully meet the many demands on a marine engineer entailed by conditions in the sea service, and the ways of seafaring men.

ON THE GROUND FLOOR.

CANADA has reached a stage in her development, when opportunities are most favorable for the establishment of industries, which will in years to come be regarded as of foremost importance. In metaphorical language, the national structure has risen above the foundation and basement stages to the ground floor. The door of opportunity stands open, affording an easy entrance to all who seek admission.

If we may consider the development of Canada to be in any degree analogous to that of the United States, it is apparent that the firms, which make a good start in the years of early development, will be the strong ones when the country comes to maturity. In the case of Canada, her growth will be even more rapid than that of the United States, for the reason that we, in this country, are able to benefit from the experience of the Republic. In knowledge, if not in experience, we stand to-day her equal.

The importance of getting in on the ground floor must not be minimized. In coming years, certain work must be done. The firms which will do this work will undoubtedly be those that have shown by past accomplishments their ability to perform it. New industrial concerns may be called into being as the years go by and as the exigencies of the situation demand, but none the less is it true that the old-established firms, when properly managed, will enjoy a favor not accorded to less experienced competitors.

Industrial concerns outside Canada can share in Canadian business as well. For many years to come it will be impossible for this country to supply its own needs, particularly in the matter of those classes of machinery for which the demand is comparatively small. To these concerns we would reiterate our advice that it is important to get in on the ground floor. By watching this market carefully, by constant advertising in the best mediums and by personal canvass on occasion, this purpose can well be accomplished.

Power Required to Drive Twist Drills†

A Diagram for Finding the Power Consumed in Drilling Cast Iron

By C. S. Frary and E. A. Adams

AS a result of the recent experiments with high-speed drills it was found that the thrust necessary to push a drill through a piece of metal was very much greater than had been supposed. Hence it would be necessary to build very much heavier and stronger machines in order to use the drills up to their full capacity.

Two years ago the Worcester Polytechnic Institute, in accordance with this fact, designed and built a new 16-inch drill press. The machine as it is now standing in the shops of the institute, consists of a box-shaped upright post somewhat similar to the parabolic posts of the latest planers. The spindle is driven by a steel mitre gear meshing with a rawhide gear. There are four belt speeds ranging from 328 to 525 r.p.m. The feeding mechanism is the weakest point in the whole construction of the drill press. It consists of a chain drive from the jack shaft, to a large sprocket, which is connected to a cone of gears by means of a universal joint actuating a small gear, which can be shifted from the lowest step of the cone to the highest, thus giving a range of feeds from 0.0045 to 0.0225 inch per revolution of the spindle. The drill is so designed that at the end of the hole which is being drilled a reversing clutch is thrown in and the drill will be drawn out of the work. As the drill was finally built the quick return ratio was about 6:1 at the highest feed and 29:1 at the lowest. It was designed for a return speed of 0.225 inch per revolution of the spindle. In other figures the return speed was about 112 inches per minute or about 2 inches per second. The machine was actually built and run with that return speed. The only trouble experienced was that the spindle after reversing, instead of stopping, threw in the feed clutch and started to feed into the hole which it had already drilled. Outside of the few things mentioned the drill press was a very strong machine and behaved extremely well under the severe test to which it was subjected, during the few twist-drill tests which could be made in the limited time at the disposal of the experimenters.

The Dynomometer.

The dynamometer, for registering the thrust and the twisting moment of the twist drill, was very simple and efficient. A hollow piston with a round top to form a table, was scraped to fit a cast-iron cylinder. The cylinder was filled with heavy cylinder oil, and had an ordinary pressure gauge tapped into the lower end. The gauge read pressure per square inch and in order to get the thrust of the drill it was necessary to multiply by the area of the piston, which was about 20 square inches. To measure the twisting moment a steel band, fastened to the enlarged top of the piston, was connected to an indicator spring by means of a steel rod screwed into the bottom of the indicator piston. Since the area of the indicator piston was only ½ square inch, and the force was applied direct in this case, the indicator spring had to be rated at ½ its usual value when used in a steam indicator. The movement of the drum of the indicator was obtained by passing a cord over a pulley, which was attached to the carriage of the spindle, and then fastening the end to a projecting arm on the dynamometer. Taking the average force as registered by the indicator diagram and multiplying by the radius of the round table gave the twisting moment. In none of the tests did the moment exceed 350 inch pounds, which was obtained with a ⅞-inch drill running at a speed of 328 r.p.m. and feeding 0.0225 inch per revolution.

In order to be sure that the thrust given by the dynamometer was correct, a calibration curve was found by applying loads on the piston of the dynamometer and reading the pressure recorded by the gauge. Every reading of the thrust during the drill tests was corrected for static friction in the dynamometer by referring to this calibration curve.

Thickness of Drill Webb.

During tests made by Prof. W. W. Bird and Mr. Fairfield in 1904, it was found that there was a great variation of the thrust obtained from drills of the same diameter working under the same conditions. On measuring the thickness of the web of the drill they were found to vary quite widely for the same diameter of drill even among drills of the same manufacture. After considerable study Mr. Fairfield deduced from common practice the following law: Beginning with a drill of zero diameter and assuming a thickness of web equal to 1-64 inch, the thickness of web should increase 1-64 inch for every increase of ⅛ inch in the diameter of the drill.

In all of the tests made this law was followed as far as possible. Drills made of Novo steel were used varying from ½ to ⅞ inch by sixteenths, and as far as they could be obtained conformed to the law proposed by Mr. Fairfield.

Among the many possible tests which could be made with twist drills only a few were taken up. All tests were made on cast iron, keeping the surface speed of the different-sized drills as nearly constant as the four speeds of the drill press would allow, and changing the feed.

The Test Pieces.

The test pieces were 10 x 2 x 1½ inches poured horizontally, being gated at three places on one side. This was to insure a fairly even hardness throughout the entire length of the specimen. Before making a test each specimen was tested for hardness by drilling a ⅝-inch hole and stopping the drill just below the surface of the specimen. The pressure registered by the gauge was taken as an indication of the hardness of the specimen.

No. of Test.	Diameter of Drill	Thickness of Web.	Angle of Lip.	Hardness of Test Piece.	Speed.		Thrust—lbs. for Feeds in Inches per Revolution.

VARIATION OF THRUST WITH DIAMETER OF DRILL.

Fig. 1.

† From the "Journal" of the Worcester Polytechnic Institute.

A test consisted of drilling three holes for each of the nine feeds at a constant surface speed of the drill of about 70 feet per minute. Three specimens were chosen of the same relative hardness and one hole drilled in each for the different feeds, and readings of thrust and twist being taken for each. This was done for all of the drills and formed one part of the experiment.

All of the above tests were made with the tests where the speed was kept constant the thrust was very nearly proportional to the feed.

With a constant surface speed the thrust is very nearly proportional to the diameter of the drill.

With the different angles of the lip the thrust decreases from 75 down to 45 degrees, and then increases for any further decrease in the angle. The moment is quite different. In fact it cannot be said that the moment is in any way proportional to the angle of the lip

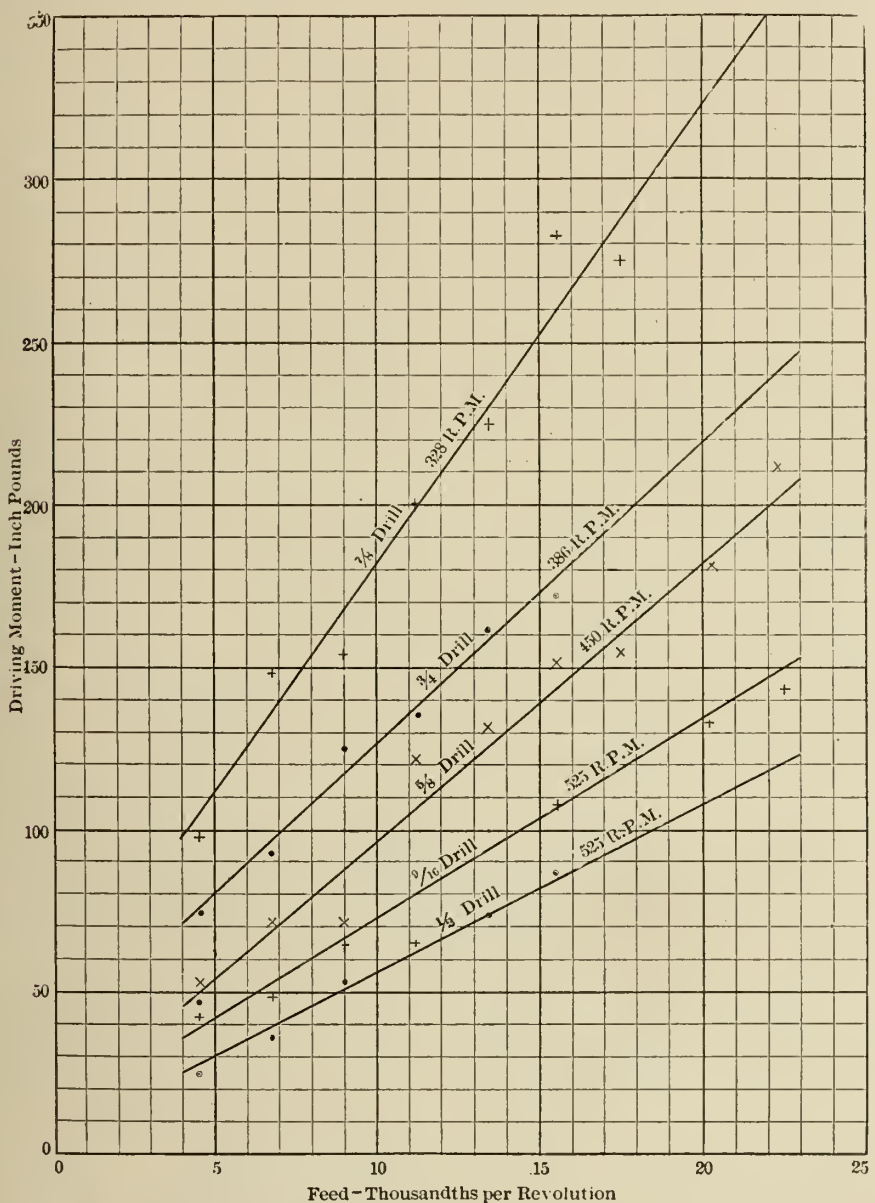

Fig. 2—Relation of Driving Moment to Amount of Feed for Different Size Drills.

a constant angle of the lip of the drill of 59 degrees. Several tests were made with a $\frac{5}{8}$-inch drill by keeping the speed constant and varying the angle of the lip from $37\frac{1}{2}$ to 70 degrees, and measuring the thrust and moment for the nine different speeds.

General Conclusions.

As a result of these tests there are several interesting conclusions. In all although it is nearly proportional to the feed.

From a study of the variation of the thrust with the angle of the lip it would appear that the 45-degree angle ought to give the best results in practical machine shop work. There is only one instance, known by the experimenters, in which the 45-degree angle is given the preference over the older angle of 59 degrees. That is in the case of William Sellers & Company, Philadelphia.

Results of Tests.

(The results of these tests are shown in the accompanying table and diagrams. The diagrams were prepared by the American Machinist from tables prepared by the writers of this paper. These diagrams speak for themselves.—Editor.)

Kelly Bros. & Co., Kenora, have received the contract to erect a $100,000 round-house for the C.P.R. at Kenora.

Consideration of Canadian Patent Act

Compulsory Manufacturing Requirements of the Canadian Patent Act, Viewed in Reference to Dependent Patents.

By Egerton R. Case, Toronto.

Registered in accordance with the Copyright Act.

IT OCCURS to me that it will be of considerable interest to analyze the Canadian Patent Act in reference to compulsory manufacture of patented inventions. It is quite clear that if a man manufactures under his patent within two years from date of same or within an authorized extension of that period he will maintain the validity of his patent. But this manufacture under certain patents is not so simple a matter as it may at first seem. In order to fully understand what I mean by the last sentence, I would invite the reader's attention to the following :

Under Sub-section (a) of Section 4 of the Act to amend the Patent Act dated August 13th, 1903, the owner of a patent must work the invention covered thereby within two years of the date of the patent, or within an authorized extension of that period. In place of the foregoing section, if the invention belongs to the following class, it may be placed under Section 7, provided the commissioner of patents' assent is obtained, which relieves the owner of the patent from the necessity of manufacturing his invention in order to keep valid his patent covering same.

The following is the class of patents which may be placed under section 7 : Certain patents for an art or process; certain patents for improvements on a patented invention when both patents are not held by the same person; patents for certain appliances or apparatus used in connection with railways, telegraph, telephone, and lighting systems, and other works usually under the control of public or large private corporations, and which appliances or apparatus cannot be installed or constructed without the consent of such corporations, and certain patents for inventions which are manufactured or constructed only to order, and are not, according to custom, carried in stock.

When a patent has been placed under Section 7, any person may apply to the commissioner for a license to construct, use, and sell the invention covered thereby, and if the commissioner is satisfied that the reasonable requirements of the public in reference to the invention covered by the patent in question have not been satisfied by reason of the neglect or refusal of the owner of the patent to make, use, construct, or sell the invention covered thereby, he may make an order requiring the owner of the patent to grant a license to the person applying for same upon suitable terms as to royalties and security for payment as the commissioner deems just. If the owner of the patent refuses or neglects to comply with the commissioner's order within three months after date of same, his patent becomes null and void.

When we come to view the requirements of our Patent Act as to compulsory manufacture in reference to a certain class of patent covering an improvement of an invention covered by a prior patent, a difficulty arises, and the object of this paper is to find out how the owner of a patent covering an invention, (an improvement on an invention covered by a prior patent) can comply with the requirements of the Patent Act in order to keep his patent valid. For the purpose of this paper, Class A patents are primary or containing patents; that is, patents that are broad enough to include any improvements that may be made in any particular invention covered by this class of patents during its lifetime; Class B patents are those that are subject to Class A patents, but yet which may be marketed by being merely added to the invention covered by Class A patents without necessitating the reconstruction or the reorganization of this invention, and Class B-C patents are those which are contained in or are subject to Class A patents and which cannot be used therewith without the reconstruction or the reorganization of the invention covered by Class A patents. In investigating the question which called this article into being, I shall first consider Class B patents in their relationship to Class A patents, and then afterwards consider Class B-C patents in their relationship to Class A patents.

In the class of inventions which may be placed under Section 7, before enumerated, it will have been noticed that when an invention is an improvement on a previously patented invention, and both patents are not held by the same party, the commissioner may order (presumably, no matter what the nature of the invention may be) that the patent covering said invention be made subject to Section 7 instead of to Subsection (a) of Section 4.

For argument's sake, we will suppose that a Class B patent has been placed under Section 7; now a demand for the invention arises; how is the owner of the Class B patent going to supply the demand ? As he may lawfully purchase the invention covered by Class A patent and add his invention thereto, and sell the resulting article as his own, he can supply the demand for his invention and maintain the validity of his patent. Even if Class A patent be placed under Section 7 and the owner thereof be not manufacturing under same, the owner of Class B patent, (whether his patent be subject to Section 7 or no) may obtain a license under Section 7 and manufacture the invention covered by Class A patent and add his own invention thereto and sell the resulting article as his own.

In considering Class B patents in connection with their relationship to Class A patents, no great difficulty arises, but when we come to consider the relationship of Class B-C patents relative to Class A patents, a difficulty certainly arises. In order to clearly illustrate this relationship, we will first consider the position of a Class B-C patent relative to a Class A patent placed under Section 7, when a demand arises for the invention covered by the first class of patent, and there be no manufacture under Class A patent. If the owner of Class B-C patent applies for a compulsory license to manufacture the invention covered by Class A patent, he may obtain same. But it is very questionable if the commissioner is empowered to grant a license of such a nature that the invention covered by Class A patent may be reorganized or reconstructed before the invention covered by Class B-C patent can be used therewith. If it be that the commissioner have the power of granting such a license, then in the supposed case the owner of Class B-C patent can maintain the validity thereof.

Again, if Class A patent be subject to Section 7, and the owner thereof be supplying the demand therefor, can the commissioner compel him to grant a license of the necessary character to the owner of Class B-C patent ? If he have the power, then Class B-C patent remains valid; but if he have not that power, Class B-C patent expires. But it is clear that the commissioner has not that power, when the demand under Class A patent is being supplied.

Again, if Class A patent be not subject to Section 7, the commissioner has no power to compel the owner thereof

to grant licenses. Now, in this case, if the owner of Class A patent will not grant the owner of Class B-C patent a license to manufacture to supply the demand, this latter class of patent must expire at the end of the term allowed for manufacture. Therefore it will be seen that the validity of Class B-C patent depends upon the owner of Class A patent.

Let us now consider the position of Class B-C patent relative to Class A patent not subject to Section 7, when the first class of patent has been made subject to Section 7 and the owner of Class A patent wishes to manufacture under Class B-C patent. Upon demand, the owner of Class A patent can obtain the necessary license under Section 7 relative to Class B-C patent; under these circumstances, Class B-C patent remains valid.

But, if the owner of Class A patent conspires to create a demand for the invention covered by Class B-C patent, knowing that manufacture thereunder cannot legally be carried on without a license from him, what is the poor owner of Class B-C patent going to do ? If he manufacture without a proper license, he is at once liable to damages for infringement. Yet the demand for the invention covered by Class B-C patent may still be kept up, and unless this is satisfied the patent must surely lapse.

It is quite right and proper that Class A patents should convey to their owners broader rights and privileges relative to the invention covered thereby than is conveyed to the owners of Class B-C patents. But under our Patent Act as it now exists, it is submitted that under certain well-defined conditions the owners of Class B-C patents suffer a great hardship, and the capital they may have invested therein is liable to be rendered valueless. As a result of the premature lapsing of a Class B-C patent under our present Patent Act, I would call the reader's attention to the benefits that accrue to the owner of a Class A patent. Suppose a Class A patent is thirteen years and eleven months old. The longest period of exclusive right that can be enjoyed by the owner of a Class B-C patent is four years. Now as Class A patent expires one month after the expiration of the Class B-C patent, the owner of Class A patent is in a much stronger and better position than the owner of Class B-C patent, because having had possession of the Canadian market for eighteen long years, he has old and wide connections and business channels that give him an enormous advantage over his competitors, although his patent has lapsed. If the manufacture of his old invention requires an expensive plant, it is not very likely that competitors will try and wrest his market away from him when they consider this fact, and the other facts before stated. Now, having a properly-equipped plant, he at once commences the manufacture of the invention covered by Class B-C patent and by modernizing his goods, he is still able to defy competition, and so have a further and unfair monopoly of the market. He has had his monopoly of the market for a certain line of goods, and it is unfair that it should be continued at the expense of others. As the Patent Act now stands, the owner of a Class A patent is favored at the expense of the owner of a Class B-C patent. It is quite right and proper that the owner of Class A patent should control his invention during the lifetime of his patent, but it certainly is a great hardship that the Patent Act now works an injustice to holders of Class B-C patents.

Everything points strongly to the antiquity of Sub-section (a) of Section 4 of the Patent Act as amended August 13, 1903. Canadian industries will be amply protected and the holders of Class B-C patents will receive fair tratment if the requirement as to importation be retained, and all patents granted issue subject to compulsory license, under proper regulations. Our Patent Act should place all inventions on an equal footing, and if for no other reason, the requirement as to manufacture within a limited time should be stricken therefrom, so as to cover the conditions controlling Class B-C patents. Of course if Class B-C patents be placed under Section 7 and no demand be made for the invention covered thereby, it will remain valid. No man will know, as a general rule, whether or no his patent is subject to another patent unless he has had this question thoroughly looked into. It is natural to suppose that if he knew beforehand what status his Class B-C patent occupied under the Patent Act, he certainly would not spend time and money in developing same. As this question becomes better understood, it is clearly apparent that as our Patent Act now stands, it is discouraging the production of inventions of a certain class, whereas it should offer the fullest encouragement to all classes of inventions, so that all inventors and manufacturers may have an equal chance of reaping benefits from their efforts.

From the foregoing, it will be understood that when a Class A patent is a recent, or a comparatively recent one, the owner thereof may come into possession of a very valuable asset, by reason of the expiration of a Class B-C patent, as, through the deficiency of the Patent Act as it now stands, the public (although the Class B-C patent has expired) will not have the right to exploit same, because of its dependency upon Class A patent.

From the above facts stated relative to the relationship of Class B-C patents to Class A patents, a number of questions arise. What consideration has the Government given the owner of Class B-C patent that compensates him for paying the Government fees, and for disclosing a valuable invention ? Would not the interests of Canada be as well protected if the requirement as to manufacture of our Patent Act as it now stands, were entirely done away with? This said section certainly works an injustice to the owners of Class B-C patents. It is clear to one who has followed this question carefully, that the placing of Class B-C patents under Section 7 will not solve the difficulty. As the industrial activity in a country increases, inventors and manufacturers watch each others' inventions very closely, as they know that their business will survive the competition of rivals if they can manufacture and market their productions so as to net them a greater profit than is made by their rivals. As a result of this keen competition, inventors and manufacturers study very carefully different inventions and do their best to improve thereon. So when an improvement is made on any invention and covered by a Class B-C patent, the Patent Act should give this improvement the full protection accorded to inventions covered by Class A patents.

Suppose a foreigner controls a Class A patent in the case above supposed, does not the Patent Act now actually operate in his favor as against a Canadian, the owner of a Class B-C- patent? Is this condition fair ? The vast majority of Canadian patents are taken out by foreigners, and, as the Patent Act now stands, it is conceivable that they might largely control the industrial affairs in Canada, which state of things is not one to be appreciated by Canadians. I submit, that if we retain the importation and compulsory license clauses, and remove the antiquated clause relative to manufacture as set forth in Sub-section (a) of Section 4 of the Act to amend the Patent Act dated August 13, 1903.

In several European countries, patents of addition (Class B and Class B-C patents), expire with the expiration of the parent patent (Class A patent). But such a law is not a just one, because, a manufacturer who has had the market is placed on a much better footing than any rival, for the reasons before set forth.

(Continued next issue.)

Gas, Gas Engines, and Gas Producers†

By J. Seton Gray, Can. Soc. C.E.

THE thermal efficiency of a modern steam plant is about 10 per cent. and that of a gas engine plant about 20 per cent. This is the principal reason for the large amount of work that has been done in recent years on the gas engine.

Again, while gas can be manufactured

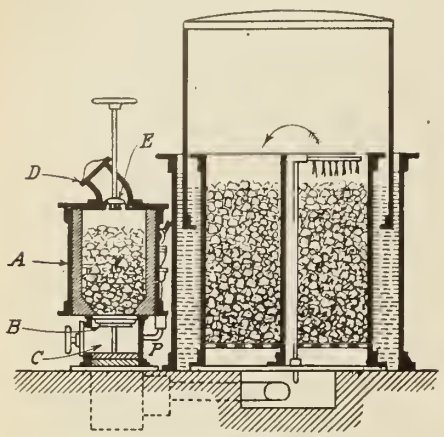

Fig. 1—Dowson Plant.

in a gas producer for about three cents per 1,000 cubic feet, city lighting gas costs between 50 and 100 cents per 1,000 cubic feet. This explains why so much attention is being paid to the development of the gas producer for the making of power gas.

The many methods adopted for the production of power gas may be divided into three general classes.

1. When a carbonaceous such as coal is heated in a closed retort, gases are given off which may be collected and used for power. This method is that at present in use for the manufacture of illuminating gas.

2. If steam be blown through a mass of incandescent fuel, a combustible gas is produced. In this process the fuel is kept incandescent by a blast of air, the steaming and blowing periods being intermittent.

3. If steam and air together be uninterruptedly blown into incandescent fuel, a gas, containing hydrogen and carbon monoxide, is produced continuously. The amounts of steam and air are regulated so as to keep the fuel at a fairly constant temperature.

Gas produced by the first method, while generally of high calorific value, is costly, as already mentioned. Water gas, produced by the second method, is much cheaper; but as it contains much hydrogen, is a very inflammable gas, and on this account cannot be used with the high compression pressures now employed in gas engine practice. These high pressures are necessary if a high efficiency is required of an engine.

The third method, however, gives a cheap gas, well suited for gas engine work, and will be treated more fully in this thesis.

Nearly all fuels containing carbon can be used for the production of producer gas. It must be noted, however, that if the gas is going to be used in a gas engine cylinder, it must be of uniform quality. It must also contain no tar or other impurities in order to avoid trouble with the valves.

To Mr. Dowson we owe the first successful producer gas plant. His plant was designed to work with anthracite coal. This coal is non-caking, and, being nearly pure carbon, contains very few densible hydrocarbons or tar. It is therefore an ideal fuel for the gas producer.

As this producer embodies in the best way the fundamental principles necessary for the production of gas from solid fuel, it will be described here.

Fig. 1 is a diagrammatic section of a Dowson gas producer, taken from "The Gas and Oil Engine," by D. Clerk. As may be seen, the producer consists of a cylindrical casing (A), lined with fire-brick, and having at the bottom fire bars (B), above a closed ash pit ((C). The upper part of the generator is closed by a metal plate on which is mounted a fuel hopper (D), having an internal bell valve (E) operated from the outside.

To begin operations, the upper cover is removed from the hopper (D), the bell valve is opened; a fire is built upon the bars (B), and air is forced through it by the steam jet (N) and the pipe (P). Fuel is slowly added from above till the whole mass is incandescent and fills the producer to a depth of about 18 inches at least. During this heating process, gases are given off by way of the open hopper and are ignited there. Care must be taken not to inhale this gas. (It contains much CO and is very poisonous, but when burned it is harmless.) When the fuel is incandescent the inner and outer valves of the hopper are closed, and the gas flows by a pipe through cooling and scrubbing devices, finally finding its way to the gas holder through the coke scrubber formed within it. From the gas holder the gas flows through another scrubber, as shown by the arrow, and thence to the engine.

In 1895 Renier, a Frenchman, after much experimental work with a Dowson gas producer, succeeded in making the engine draw its own supply of gas direct from the gas generator, without the use of a gas holder. While this plant was not a commercial success, it was the forerunner of the modern suction gas producer.

The Dowson gas producer has already been described. The following is a description of a suction gas producer; the difference between the two systems may be seen from the descriptions: The adjoining sketch (Fig. 2), shows the general construction of this piece of apparatus. To set it in operation a fire is built on the grate. The door at the front of the producer allows this to be

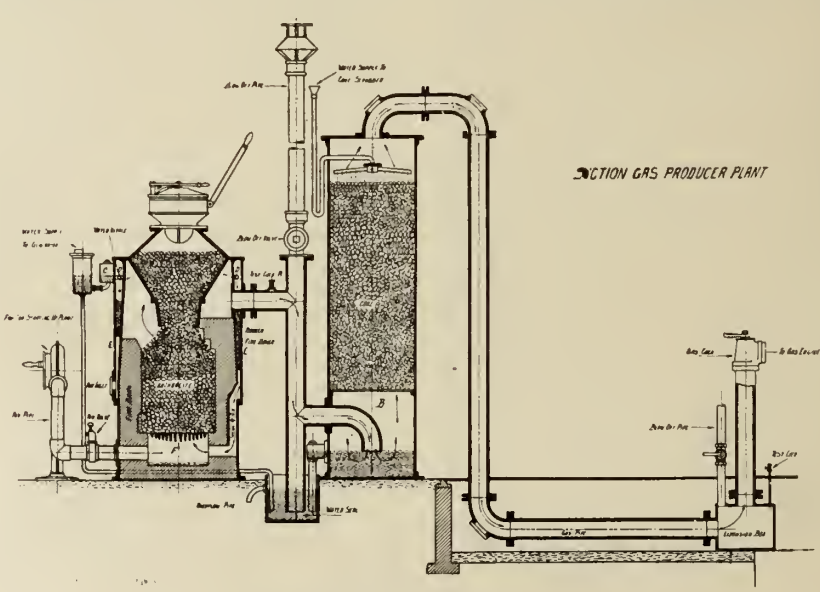

Fig. 2—Suction Gas Plant.

† Read before the Mechanical Section of the Canadian Society of Civil Engineers, Feb. 27, 1907.

easily done. A quantity of paraffine waste, or other combustible material, is placed inside the generator, and lighted. Broken wood is then added through the hopper at the top, and this is followed by coal until a bright fire is burning. The air for combustion is supplied by a small hand fan (B). As soon as the fire is burning brightly the water necessary for the production of the gas is turned on.

This gas is tested by opening a small test cock (A), and applying a light. If the gas burns with a blue flame it is ready for use. The gas is then allowed to enter the scrubber (B), and to pass through the expansion box to the engine. Before being allowed to enter the engine the gas is again tested, and if it still burns with a blue flame the engine may be started. The hand fan is stopped as soon as the engine starts work, and thereafter the whole plant becomes automatic.

During the suction stroke of the engine a vacuum is set up in the engine cylinder. To fill this vacuum air and steam are drawn into the generator, are there turned into combustible gases, which pass through the scrubber to the engine.

For the production of the necessary steam a water supply (C), is fixed the generator. This supplies water to the vaporisor (D). This vaporisor is just a pipe perforated with a number of holes. Every time the engine draws gas, which it does in proportion to the load, a small quantity of water is drawn out of the vaporisor, falls on a quantity of hot refractory material (E) in the casing, and is there converted into steam. This steam is caught up by the current of air drawn in at the air valve. The mixture of air and gas passes round the casing to a space (F) under the fire bars, from whence it is drawn up through the body of incandescent fuel, where it is turned into gas. The gas passes from the generator through a water seal at the bottom of the coke scrubber, passes through the closely-packed coke, where its tar and other impurities are extracted, and then goes to the engine cylinder. -A continuous stream of water is allowed to fall in a spray over the coke, whereby the gas is cooled to the normal temperature.

The theory of the chemical action that goes on in the gas producer is as follows : When air comes in contact with glowing carbon we get, first of all, the burning of the carbon to form carbon dioxide, according to the equation $C+O_2=CO_2$. Now carbon at a high temperature is a very strong reducing agent, so when the CO_2, already formed, comes in contact with the mass of glowing carbon through which it must pass, the CO_2 carbon dioxide, is reduced to CO, carbon monoxide, according to the equation $C+CO_2=2CO$. This carbon monoxide is a combustible gas, very poisonous, and can be used in the gas engine.

When steam comes in contact with glowing carbon, it is reduced by the action of the carbon to CO and 2H, according to the equation $C+H_2O=H_2+CO$.

The producer plant last described is known as the suction plant, because it is kept in continuous operation by the suction stroke of the engine. Another plant also in common use is known as the pressure plant. A well-known example of such a plant is the Dowson plant, already described. The chemical reactions in this case are exactly similar to those already described when dealing with the suction producer. The principal differences between the two systems are that the pressure system requires a steam boiler in which to generate the steam required for operation, also, that with this system a gas holder, in which to store the gas, is required.

There is one serious objection to the pressure system which is not found in the other system. The whole producer is under pressure. If, then, there are any leaks between the producer and the engine, gas will escape. As has already been mentioned, this gas is very poisonous, and may cause the death of a careless operator. The suction producer is full proof in this respect, because the pressure in the system is less than atmospheric. If, then, there are any leaks in the system, all that can happen is that air will pas into the system through these leaks. While this will reduce the efficiency of the plant, it can do no other damage. The fact that no boiler or gas holder is required in the suction producer is a great point in its favor, because simplicity is the essence of good engineering, especially when we are dealing with a machine which is going to be put under the care of men who have no engineering knowledge or skill.

It takes only a few minutes to start up a small gas producer plant. The Highland and Agricultural Society of Scotland made some tests in Glasgow in 1905, to ascertain the time required to get an engine and producer plant to full

DIAGRAM SHOWING
HOW THE HEAT IN 1 LB. OF COAL IS UTILIZED
IN THREE CHARACTERISTIC PLANTS.

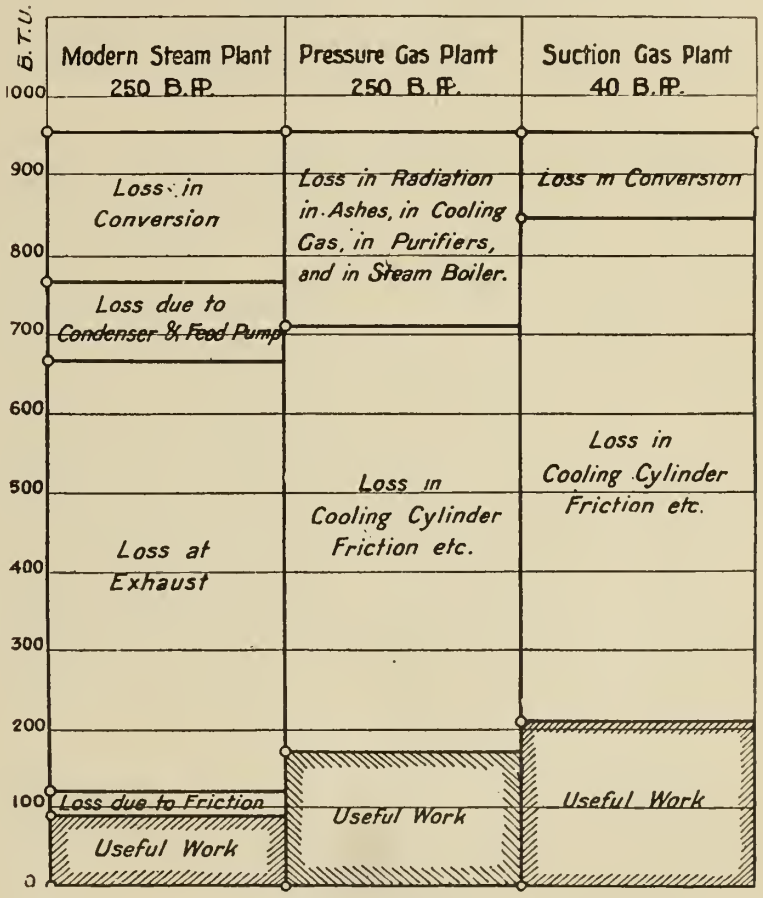

Fig. 3—Heat Diagram.

working load, starting with the producer empty and cold. Only two men were allowed to start each plant on trial. The results were as follows :

Builder of Plant.	Capacity of Plant B. H.P.	Time to start.	Remarks.
Campbell Gas Engine Co	18	13 min.	
" " "	8	17½ min.	
Crossley Bros.	24	15½ min.	
Industrial Engin'ring Co.	10		Started but was compelled to stop because water was shut off at main.
National Gas Engine Co.	20	48 min.	Excessive time caused by defective igniter.
" " "	10	15¾ min.	
Messrs. Tangyes, Ltd ...	21	16 min.	
" " "	12	12½ min.	

These tests were all made starting with the producer cold. The average value for a small plant is about 15 minutes. But in actual practice the fire is banked up when the producer is not in operation as, for instance, when it stands over night. When this is done the engine can be running in about seven minutes from the start. According to Mr. J. Emerson Dowson, the stand-by losses due to this banking up of the fire amount, in a moderate-sized plant, to about three lbs. of coal per hour.

Comparison of Steam and Producer Plants.

Dealing with efficiency, the adjoining diagram shows very clearly the values obtained from three characteristic plants.

Column 1 shows how the heat is used up in a modern steam plant of 250 h.p. The total heat contained in the coal was 952 b.t.u. Of this there is a loss in conversion of 20 per cent., much of the heat in the fuel passing up the chimney. There is a further loss of 10 per cent. in the feed pump, in condensation, and in radiation. Of the remaining 70 per cent., 57½ per cent. is lost in the engine exhaust ; and after making an allowance for friction losses, we find that out of a total of 100 per cent., only 10 per cent. is converted into actual work.

While this value of 10 per cent. may be obtained in test, in actual everyday practice the efficiency will be still less.

Column 2 shows how the heat is used up in a pressure producer plant of 250 h.p. There is, first of all, a loss of 25½ per cent. in radiation, in ashes, in gas coolers, and in steam boiler. Of the 74½ per cent. which goes forward to the engine, 33.2 per cent. is lost in cooling the engine cylinder, 20 per cent. is lost in exhaust, and after allowing for friction we find that 18 per cent. of the available heat is given as actual work in this system.

Column 3 shows the distribution of the losses in a 40 h.p. suction producer system. It may be taken for granted that the losses in a 250 h.p. system will be smaller. Of the total heat in the coal 89 per cent. is transferred in the gas to the engine cylinder. After deducting engine losses, as in the last case, we find that 23 per cent. of the available heat is transferred into mechanical work. The efficiencies then are as follows :

Steam, 10 per cent.; pressure producer 18 per cent.; suction producer plant, 23 per cent.

There are one or two other points worthy of mention while dealing with the efficiency question. In a small steam plant the loss due to bad stoking is often quite considerable ; in a producer plant there is very little such loss.

With regard to stand-by losses, as before mentioned, these are about three lbs. of coal per hour in a moderate-sized producer plant, whereas, according to results obtained by Mr. Dowson, this loss is about 71.5 lbs. of coal per hour in a steam plant of the same size. When we consider that most are idle for about 199 hours every week, we see how great will be the difference in coal due to stand-by loss.

This loss is small in producer plants because, since very little air is passing through the fire, when the fire is banked up in the gas generator that piece of apparatus is turned into a slow combustion furnace.

With regard to the efficiencies mentioned on the last page, there is a point of great practical interest which is too often overlooked. When we say that the efficiency of a steam plant is 10 per cent., while that of a gas producer plant is 23 per cent., we mean, among other things, that, for the work equivalent of 10 tons of coal, we must not only buy 100 tons, but we must also pay for the labor of handling this, and also for storage space. With the producer plant the calculations are made only on 23 tons of coal. A similar relation holds in the disposal of the ashes.

Dealing with the problem of fluctuating loads, the following test was made on a suction producer plant by Messrs. Crompton & Co., Ltd., of London, Eng. A gas engine was run for four hours with a load of 10 h.p., then a load of 80 h.p. was thrown on suddenly. The plant immediately responded, and hardly a flicker was noticed in the lights supplied from the engine. It is to be borne in mind also that this was done without the use of a gas holder. This can be done by any well-designed producer plant, and is a performance that an engine working from a steam boiler would find very hard to beat.

Coming now to the problem of attendance. It is found that a complete producer and gas engine of 100 b. h.p. capacity requires the labor of one man for two hours each day, to keep it in first-class running condition. Everyone who has run a steam boiler and engine plant knows the troubles that are constantly turning up. The sanitary authorities complain that so much smoke is being thrown into the air, or the injector fails to operate, and the water begins to creep down in the water gauge. The boiler has to be cleaned out twice a year ; there is a large amount to be paid for insurance, for inspection, for wear and tear of fire bars and other fittings, for the repair of leaks in joints caused by the high pressure of the whole system, and, finally, there is the knowledge that some day the whole plant may take it into its head to go out by the roof.

Contrast with this the gas producer. It is clean and efficient, there is very little water to handle (¾ gallon per b. h.p., a steam plant requires 4 gallons per b. h.p.), and very little attention required. The whole system, except the engine, is subject to pressures of only

Place.	K.W. hrs.	K.W. per lb. coal.	Lubric. oil per K.W. hr.	Cotton waste per K.W hr.	H.P. capacity
Clausthal	219,150	.36	5.6	.558	100

Werden	102,716	.36	6.07	2.99	90

a few lbs. per square inch. There is no chimney to build and maintain, nor is there any smoke nuisance. When the facts are considered that the system is cheap to instal, and also cheap to operate, one has to wonder at the slow growth of the gas producer industry compared with what it might be.

It has been argued against the producer plant that gas engines are not very good for the operation of electric generators. As an example to contradict this statement, in Granada, Spain, three single cylinder gas engines were installed rated at 80 b. h.p. each. These engines drive alternators in parallel, and have supplied the whole city with light for the last two years. Now, there are gas engines on the market in which the problem of balancing has been very carefully dealt with. If the result mentioned above could be obtained with single cylinder engines, there should be no difficulty in obtaining satisfactory operation from the modern three cylinder engines.

The following is taken from Dr. Oskar Nagel :

Several years of experience have shown that the gas power plants are fully as reliable as the best steam plants, and have the advantage of much greater economy. The following table of results of plants built in Austria and Germany, on the Koerting system, bears out his statement. It is to be noted with regard to these results that the plants are small, and were working only a short time each day, and that stand-by losses are taken into account.

A few facts and figures at this point should prove of interest.

A small joiner shop was driven by a 30 h.p. motor. This motor was replaced by a 60 h.p. suction producer plant, built by the National Gas Engine Co. The electric drive cost $13.20 per week. The same work was done by the producer at $2.88 per week for fuel, $5.32 for labor, oil, etc., also interest on capital and depreciation. This shows net saving of $6 per week. It also shows that the gas engine is going to be a keen competitor of the central station (electric).

The National Gas Engine Co installed two complete suction plants in the south of Scotland in a factory which had been buying power from a central station. Before the installation was made the engineers in charge of the work made the following calculation of probable saving : The 160,000 units of electricity ewquired per annum, at 3⅛ cents per unit, gives a power bill of $5,000 per annum. For the same power, with a suction producer, assuming one lb. coal, gives one b. h.p. hr., 108 tons of coal per annum would be required. At $3 per ton the fuel for the producer costs $324 per annum. Allowing 10 per cent. for interest on capital and depreciation, $171 for labor, $120 for oil and sundries, the total expenditure is $1,881 per annum, and the saving due to the adoption of the producer plant $3,119 per annum. The cost of engine and producer plant, complete, was $6,240, the electrical equipment cost $3,360 for two dynamos, switchboard, and wiring, or the total of $9,660. A saving of $3,119 per annum would therefore pay for the whole plant in three years.

It is interesting to mark the effect of the perfecting of the gas producer on the gas engine industry. Messrs. Thorneycroft & Co., shipbuilders, London, England, have just fitted a number of canal barges with suction producer plants and gas engines. The results of these have been so satisfactory that they are going to try them on coasting and merchant vessels. The British Admiralty is making experiments to find what are the limitations in using it for naval work.

The greatest advantage the producer has for marine work is that the amount of coal to be carried is greatly reduced.

In a country like Canada, where farming is done on a large scale, and where the power users are so scattered as to prohibit the building of central stations for power and light, the gas producer ought to have a large and increasing use. Messrs. Tangye, Ltd., of Birmingham, England, have put on the market a portable gas engine and producer plant to meet the demand of the farmers.

About ten years ago attention was drawn to the fact that a large amount of power is available in gas which is usually thrown away from blast furnaces. It had been stated on good authority that 468 h.p. may be developed per ton of iron produced per hour. In the United States of America alone there were produced in 1905 23,000,000 tons of pig iron. This is equivalent to an available power of 1,225,000 h.p.

The chief difficulty to be overcome in the use of this blast furnace gas in a gas engine is that connected with the removal of the large quantities of dust which it contains. Another difficulty sometimes met in a small plant, namely, that the gas is very variable in quality, is overcome in large plants by mixing the gas obtained from several furnaces together. However, the trouble due to this is not very great in a well-designed plant. The gas, which is very hot when it leaves the furnace, is usually cooled in the process of extracting the dust.

The quantity of dust in the gas varies greatly with the kind of ore and coal used. For instance, the Cockerill Co., Belgium, had a 200 h.p. gas engine running at their works in Seraing for three years without any special provision being made for the elimination of the dust contained in the gas. During all that time the engine never had to be cleaned on account of dust, although it was running night and day.

On the other hand, this same company, at their works in Differdingen, experienced trouble right from the start with some 600 h.p. engines which they installed. Investigation showed that the Differdingen gas contained four or five grammes of dust per cubic metre of gas, while the Seraing gas contained only from .25 gm. to .5 gm.

Experience shows that the furnaces using hematite ores give a gas containing very little dust, and what dust there is settles very easily, even in short lengths of pipe. Oollitic ores, on the other hand, give a gas containing much dust, which passes quite readily with the gas through long lengths of pipe.

There are two ways at present in use for the purification of blast furnace gases.

1. Passing the gas through scrubbers containing sawdust or coke, in exactly the same way as is done with producer gas.

2. The gas is caused to pass through a centrifugal fan. A jet of water enters the axis of the fan, and is driven outwards in the form of a fine spray. This spray of water gathers up all the dust in the gas. This latter method was tried in the Differdingen plant already mentioned, with the result that while the gas contained 4 gms. dust per cubic metre when it left the furnace, it held only .25 gm. after passing through the fan, and could then be used with success in the engines.

The calorific value of this gas, as might be expected, is very variable. It may be taken that rich gas means poor operation in the blast furnace, while poor gas represents good operation therein. The average calorific value is about 110 b.t.u. per cubic feet, and an average analysis shows CO, 28 per cent.; H. 2.5 per cent.; CO_2, 7 25 per cent.; N. 61.3 per cent.

This paper has been an endeavor to point out a few of the merits of the gas producer. The subject can only be taken up in a general way, because there are so many conditions to be met in the problem of power generation, that each case must be taken up separately, nevertheless the success of the producer, during the few years in which it has been developed, makes a thorough knowledge of this piece of apparatus necessary to anyone who pretends to be up to date in power plant work. The small producer plant has a field in sparsely-settled districts which cannot be as well met by any other existing piece of apparatus. The blast furnace engines are

also growing in popularity as their operation becomes better known. As has already been pointed out, there is a great deal of power going to waste at present in existing blast furnaces. If the whole of the power from Niagara were utilized, it would only give three times the h.p. that is thrown away by the blast furnaces of the United States of America alone. From these facts one is encouraged to believe that the gas engine industry has a bright future before it, now that the gas producer has proved to be a commercial success.

BOOK REVIEWS

MODERN STEAM ENGINEERING. In theory and practice, by Gardener D. Hiscox, M.E., 487 pages and 405 specially made engravings and diagrams; price $3; New York: the Norman W. Henly Publishing Co.

The author of this book is already well known from former publications written by him, such as "Gas, Gasoline and Oil Engines," and "Compressed Air in All its Applications." The book is designed for engineers, firemen, electricians and steam users, and for a practical theatise approaches nearer the ideal than any book issued heretofore on the subject. It fully describes and illustrates the property and use of steam for the generation of power in the various types of engines in use. The slide valve, high speed, Corliss, compound multi-expansion engines, and their valve gear, the DeLaval, Parsons, Curtiss and other turbines are fully described and illustrated. Forty-two tables of the properties and application of steam and its various uses are included. An important and very valuable feature of this book is the questions and answers submitted after each chapter. There are nearly two hundred of these, such as might be asked by an examining board in connection with steam practice. Thus the book is not only a guide but a teacher. Many books of a much more exhaustive character have been written on this subject, but for the size of the volume the author seems to have hit the mark fairly well.

BOILER WATERS, Scale, Corrosion, Foaming. By William Wallace Christie, M.A.S.M.E., consulting engineer, author of Chimney Formulae and Tables, etc. 235 pages, 77 illustrations, price $3.00 net. New York: D. Van Nostrand Co.

After the title page the author has a panel containing four boiler proverbs, as follows: "A steam boiler is a steam generator, not a kettle for chemical reaction." "Get, if possible, a supply of clean, soft, natural water." "The only compound to put into a boiler is pure water." "Oxygen, the most useful element, is, when free in boilers, a most destructive corrosive element." The author outlines as an axiom in the preface that the relative value of one boiler to another may in many cases be measured by its scale-forming propensity with a given water. Purify this water and all boilers come much nearer a uniform value per unit of heating surface. The book contains ten chapters dealing somewhat exhaustively with the subject at hand. Great importance is attached to the question of the softening of the water to be used, it being intimated that such water cannot produce scale or corrosion.

THE COPPER HAND BOOK.—A manual of the Copper Industry of the World, filed and published by Horace J. Stevens, Houghton, Michigan, 1,116 pages, $5.00 in buckram binding with gilt top, $7.50 in full morocco gilt.

This is the only publication devoted exclusively to the copper industry. Although encyclopaedic in scope it is written throughout in plain language. The major portion of the book is devoted to a chapter describing important mines, and listing every copper mining company of importance. 4626 mines and companies are listed in this book, there being 777 more titles than in the preceding annual edition. It is the only publication in the mining field that gives ratings to the mines and companies. The good companies are recommended, and the fraudulent companies, of which there are many, are denounced in plain language, the facts upon which, first ratings are based, are given in detail. The publisher makes an unusual offer of sending this book on a week's approval prepaid to any address in the world, without any advance payment, and the publisher states that of many thousands of the books sent out, less than 5 per cent. have been returned as unsatisfactory, and less than 3 per cent. of the books retained, remain unpaid for.

ABOUT CATALOGUES.

BORING MACHINES.—Horizontal boring machines are described and illustrated in catalogue and treatise No. 4, 1905, of the Binsse Machine Co., Newark, N.J.

SAND SIFTERS.—Battle Creek Sand Sifters, worked by steam, air, belt and hand power, are described in a pamphlet issued by the Hamilton Facing Mill Co.

LIGHT AND HEAT.—Vol. I., No. 5, of Lux, "a miniature magazine of light literature," issued by the Nernst Lamp Co., Pittsburg, is to hand, and consists of 15 pages of hints in the electric lighting and heating line.

PNEUMATIC TOOLS AND FORGE.—Thor pneumatic tools are shown working in various capacities by a number of very clear photographs in catalogue No. 7, just received from the Independent Pneumatic Tool Co., Chicago and Aaron, Ill., A pamphlet enclosed treats of the Gunnell pneumatic forge.

ELECTRIC TRAVELLERS AND OTHER CRANES.—A bulletin illustrating a number of installations of cranes and other equipment furnished various railways covering a wide range of service, with numerous illustrations from photographs, has been issued by the Whiting Foundry Equipment Co., of Harvey, Ill.

BULLETIN No. 139, which has just been issued by the B. F. Sturtevant Co., of Boston, Mass., in its engineering series, presents a full line of generating sets driven by direct-connected vertical enclosed engines with forced lubrication. The published list contains 14 sizes, ranging from 3 to 50 K. W. in output; the former driven by a 3½ x 3 engine and the latter by a 12 x 10. All of the engines were especially designed for generator driving.

SOMETHING NEAT. One of the most attractive calendar souvenirs issued for the coming year is that of H. J. Logan, bookbinders' and printers' machinery, 136 Bay St., Toronto. The calendar is mounted on an attractive aluminum background containing the names of some of the lines manufactured by this company. Alongside is a handsome thermometer, which may be read with ease at some distance. It makes one of the most attractive desk calendars that have come to this office.

Mechanical Reviews

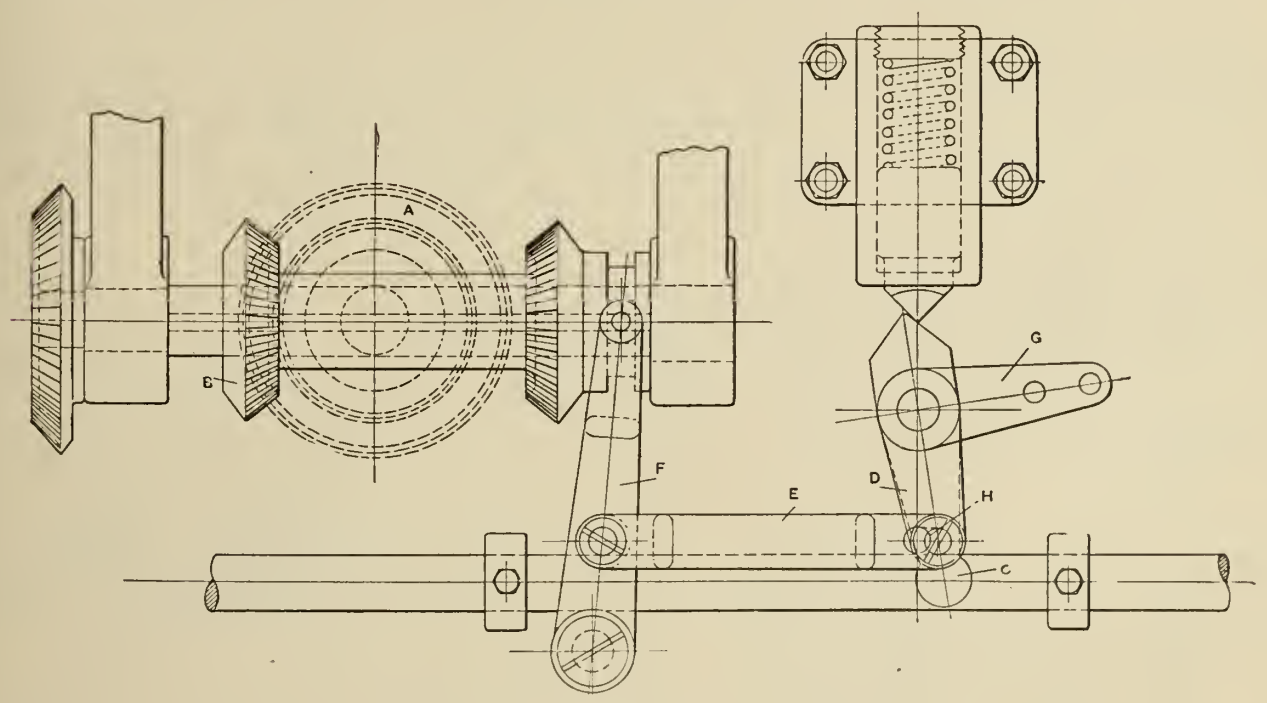
OPINIONS AND STUDIES WORTH NOTING

AUTOMATIC REVERSING MECHANISM FOR GRINDING MACHINE.

THE problem which led to the design of the reversing mechanism shown in the accompanying cut was to get a grinding machine for grinding the bores of cast steel car wheels, the bore being about 1½ inch diameter and larger. Owing to the hardness of the steel used in the wheels, no roughing cut could be taken before the grinding operation. This necessitated that sometimes up to ⅜-inch on the diameter had to be ground out, and in order to make the operating cost of the machine as low as possible it was equipped with automatic reverse for the back and forth motion of the emery wheel, and with automatic feed of the cut.

One new feature of the machine in question is that the emery wheel is driven by an independent motor, which is mounted on the emery wheel rest so that it travels with the emery wheel. The reversing of the traveling motion is obtained by a driving bevel gear, A, and an engaging double pinion, B, which can slide back and forth on the shaft, but keyed to it in order to drive. When one end of the pinion engages the driving gear the carriage moves forward, and when the other end of the pinion engages the driving gear the carriage moves backward. This back and forth sliding motion of the pinion is caused by a system of levers, a plunger acted upon by a spring, and a shaft which is fastened to the bed of the machine and is equipped with two collars. By changing the distance between these two collars the length of the traveling motion is changed.

The illustration shows the pinion engaged so that the carriage will move backward. As the carriage moves, the lever C comes in contact with the rear collar. The lever moves and pushes the plunger upward, compressing the spring. During the first half of the period the link E does not move, owing to the oblong slot H, and gear B remains fully engaged to the driving gear. When the levers C and D have passed the central position, the pressure of the spring comes into action and pushes the plunger downward. This moves the lever D, and by link E the motion is transferred to the lever F, which causes the pinion to slide, disengaging one end and engaging the other. The carriage reverses and starts to move forward. In order to obtain the feed of the emery wheel the lever G in connected to the reversing mechanism. At the end of the lever two strings are fastened, which are led up to the ceiling, and over sheaves lead down one to each of two ratchets at the end of the feed screw. These ratchets are arranged so that when the carriage reverses at the rear end one of the ratchets feeds, and when the carriage reverses at the front end the other ratchet feeds the cut.—S. K., in "Machinery," N.Y.



Automatic Reversing Mechanism for Grinding Machine.

Do not waste time, for that is the stuff life is made of.—Franklin

A COMPACT TOOL CHEST.

I SEND you a design of a tool chest for machinists and tool-makers, which I find to be the best chest for use in a fine machine shop, as it takes little or no bench room. The body is made of ½-inch boards. The lid marked B is cut on an angle and hinged in the centre of the top, like the design. The cover, marked A, is hung on hinges inside of the lid B, giving a space between A and the inside of the lid B, and on the inside of A for calipers, dividers, or any such tools, to be held under brass clips,

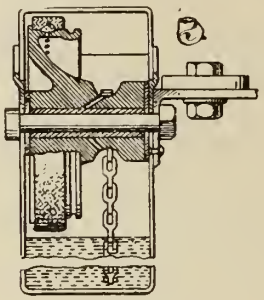
and a space in front of A, as shown in the design, for scales, straight edges, centre gauges, and drill gauges.

A piece of heavy felt or leather fastened on the face of A, as shown in the design, stops the chafing of the tools on the drawers. These can be held in position under small, round-headed, brass screws. The front and the bottom of the drawers, also the backs, are to be made 3-16-inch thick. The ends should not be less than ¼-inch thick, and a groove 3-16x¼-inch should be cut for runways, leaving the space E at the bottom for heavy tools such as hammers, monkey wrenches, etc., thus leaving the drawers for other tools.

This chest can be carried by a shawl strap, the design for the handle of which is shown above. This handle can be made of brass or any other metal. This chest, if tools are properly arranged, will hold all that any machinist or toolmaker will require, as there is practically no unused space. I have had one of these in use for two years, and it meets all requirements.—H. F. Benitez, in American Machinist.

WHEEL FLANGE OILER.

THE curves of street railways are usually so sharp that it is necessary to keep them well lubricated in order to prevent undue wear and screeching of the wheels as they grind against the tracks. Aside from the expense of keeping the curves lubricated the practice of greasing them is extremely objectionable to pedestrians who are liable to soil and ruin their clothing by contact with the oily substance. The accompanying engraving shows a method of obviating this objection which consists in oiling the flanges of the wheels instead of the tracks. The oiling device is arranged to be brought into operation at the will of the motorman so that the lubricant is applied only when needed and



Wheel Flange Oiler.

where needed, because it is on the flanges that most of the friction occurs. This oiler is not limited to street railways, but is also applicable to the curves of steam railways where much power has been uselessly spent because heretofore it has not been the practice to oil these curves. The device comprises an oil chamber in which a wheel is mounted to rotate. The wheel is provided with a wick which is seated like a tire on the outer rim. Oil holes lead through the rim of the wheel to the wick. The wheel does not touch the oil in the chamber, but a loose chain which hangs in the oil is turned by the wheel and serves to feed the lubricant to the rim whence it passes through the holes to the wick. In use the device is mounted on a bracket in such position that it can be swung against the wheel flange by the operation of a lever. A portion of the oil chamber is cut away permitting contact of the wick with the flange, and thus causing the wheel in the oil chamber to rotate and feed the oil to the wick. The inventors of this improved oiler are Messrs. F. S. Baird and E. W. Carroll, of Congress, Arizona.—Scientific American.

KYNOCH, LIMITED, PRINTERS AS WELL AS MANUFACTURERS.

Those who know Kynoch, Limited, simply as manufacturers of gas plants, gas engines, etc., and who receive their printed matter from time to time, may not have noticed that every catalogue, circular, etc., bears the imprint of the Kynoch press, and is done at their works in Witton, Birmingham, England. The literature printed by them is certainly designed with considerable dignity and printed very tastefully.

A booklet issued by them, which may be of considerable interest to readers of Canadian Machinery, is one on "Cheapest Power on Earth," giving much information on the economy to be effected by the use of gas plants. Copies of this booklet are available by application to Kynochs, Limited.

A Compact Tool Chest.

A man may hide himself from you in every other way, but he cannot in his work; there you have him to the utmost.—Ruskin.

Tricks of the Trade

Everybody is invited to contribute to this page. Send in your ideas, odd jobs you are doing, and anything of interest to fellow-workmen. Remuneration will be made for such contributions. [Ed.]

FEATURES IN GAS ENGINE CONSTRUCTION.

By S. L. Fear, Toronto.

DURING the past few years the growth of the gas engine has been so rapid that the great tendency has been toward new things and new arrangements, rather than toward a perfecting of apparatus in operation. But now that the gas engine has come to stay, and we are not looking for any radical changes, it is up to the machine shop to raise the standard, and increase the efficiency of this new motor. There are now many shops turning out machines, and each shop holds to certain ways of casting, forging, machining, or assembling; and these are held to be best. As to which is the best—that is a matter of discussion.

Casting of Cylinders.

Let us look into a few of these differences, and take firstly the casting of cylinders. Of course we must first decide whether we will make the casting with the water jacket integral with or separate from the cylinder. This is a point of discussion. Casting the jacket separate provides an easy and cheap renewal in case it is cracked by the water freezing; on the other hand, the jacket cast integral saves the packing of an extra joint, which is troublesome. Casting the jacket integral seems to be in favor, so then let us take the casting of a cylinder with water jacket integral.

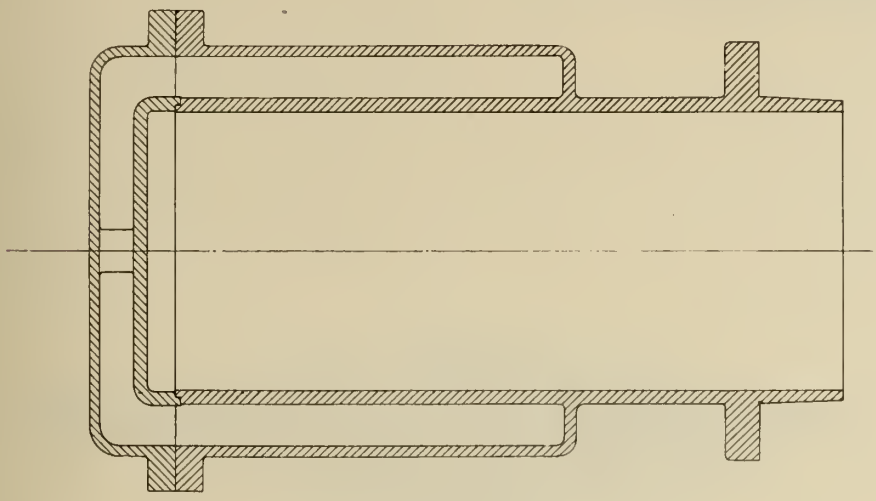

Fig. 1—Section of Cylinder.

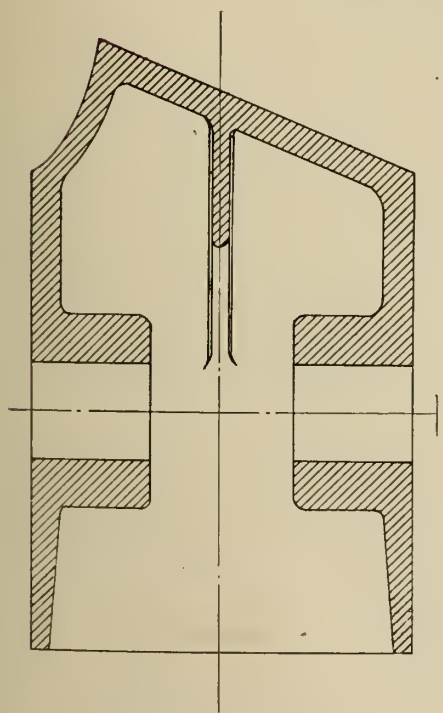

Fig. 2—Two Cycle Piston Head.

Our next point of difference or question is: Shall we cast the head separate from, or integral with, the cylinder? In the case of the head being cast integral, the machining or boring of the cylinder is the difficulty; while in the cylinder with head cast separate, ease of inspection of piston is provided, and the boring bar is used with less difficulty. In assembling, however, we have a joint to pack, which joint must first have been machined and then provided with the necessary stud bolts.

Before passing further we might note that some shops place a steel lining inside the cast cylinder; for which they claim the advantage that a new liner may be more easily put in place of the old one, than the cylinder could be rebored; that upon replacing the old liner and piston the engine is as good as new.

Then, to return to our casting of a water-jacketed cylinder, shall we cast the head integral or separate from the cylinder? Since we are to cast the jacket integral with the cylinder, we must look after a way of cleaning the jacket from the sand core, and if we make the head separate, the core can easily be removed. Then we must consider the valve seats. Shall we place these in pockets at the sides, or shall we place them in the cylinder head? Providing pockets, either both on one side or one on each side, complicates the patterns, and increases the core work; while if the head is made spherical and the valves placed at an angle of 90 degrees, or if the head is made flat and valves placed with stems vertical, the core work and casting are both simplified.

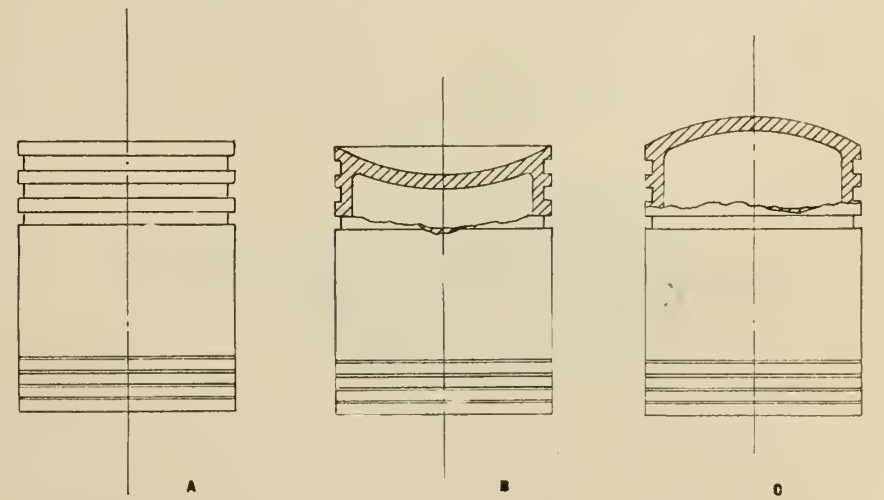

Fig. 3—Four Cycle Piston Heads.

The material used in cylinder casting is, of course, the best grey cast iron. One or two firms anneal their cylinders

in order that all harmful stains, that may be caused in the casting by cooling, are eliminated.

Gas Engine Pistons.

The piston used in gas engines is of the trunk type, single ended; in some cases a double ended piston is used, but then it must be water cooled. The trunk type of piston, of a good quality of grey cast iron, is provided with snap rings, also of good grey cast.

Fig. 4—Detail of Piston and Connecting Rod.

The shape of the head varies. Fig. 2 shows a two-cycle piston head, Fig. 3 shows three shapes of a four-cycle piston, (a) a flat head, (b) the sunk head, and (c) the crowned head. Pistons shown in (b) and (c) are not often used, since they cause internal strains in the piston not in its direction of motion.

The bearings of the pin are usually equally divided between the piston and connecting rod. At the bottom of the piston oil grooves are provided to lubricate the cylinder.

The manufacture of the piston rings is usually as follows: A casting is made in the shape of a cylinder, about 1-4 of an inch larger than the rings on the outside diameter, and 1-4 of an inch smaller on the inside diameter. The casting is then placed in the lathe and roughed out to an outside diameter, a little larger than the finished diameter. It is then cut in the miller, so that one side will slip past the other. The ring is then clamped on the face-plate of the finishing lathe, contracted as it will be in the cylinder; and then finished to .003 ins.— .005 ins. larger than the cylinder diameter.

The rings are kept in position on the piston by dowel pins, in such a manner that their joints are staggered around the circumference, and thus tend to minimize the leakage of gas past the joints.

The piston pin is usually solid, but sometimes hollow. Bushings for wear are in some cases provided in the piston, and then the connecting rod clamps the pin; or in others, bushings are provided for the connecting rod, and the pin is held by set screws in the piston bearings. The pin is ground accurately to size.

Fig. 5—Double Cylinder Crank Shaft.

The Connecting Rod.

The connecting rod is almost always a forging. In some cases the piston end is milled square and a wedge provided in connection with the bearings, to take up the wear, as shown in Fig. 5. The crank end in this illustration is of the usual marine type, which is commonly used with large vertical gas engines. The bolts holding the bearing to the rod may be quite light, since there is no tensile strain on the return stroke.

Gas Engine Cranks.

Figures 6 and 7 illustrate the two and three-throw cranks, as used in gas engine work. The cranks are forgings with the balancing weights bolted onto the arms. The two-throw crank has cranks at 360 degrees; and the moving parts are therefore not balanced in themselves, but the explosions are balanced. The three-throw crank has the best balance of the cranks commonly used, both dynamically and kinetically, in that the mechanical motions of the pistons and the cycles of operation overlap.

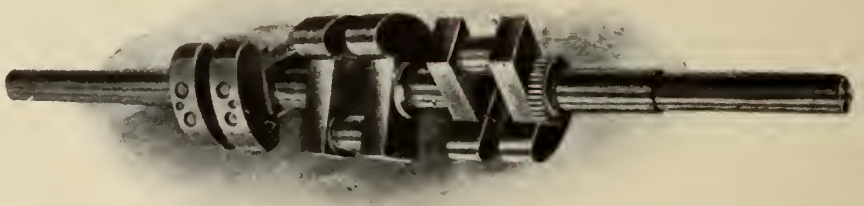

Fig. 6—Triple Cylinder Crank Shaft.

IS PIECE-WORK A NECESSITY?

By G. C. Keith.

WHY is a piece-work or premium system necessary? This question has come up many times. For a solution of this problem it is only necessary to compare two shops, one with and one without some system of rewarding their men according to their capacities, and note the difference in cost. Why is it that some men in our offices receive ten or fifteen thousand dollars a year and others only a few hundred or probably a thousand? Is not the answer that the former have a greater capacity for work than others? Would we not sooner have lost five thousand soldiers than Lord Roberts in South Africa? I may safely say, yes. Now here we have a man worth five thousand other men. On a smaller scale, we find this condition equally true in the shops. We have men ingenious enough to see an easy way to do certain jobs and thus accomplish twice or three times as much as certain others. Then there are others who never appear to accomplish anything, so in all fairness should not the man who uses his brain be rewarded? Should not the man who accomplishes the most work receive the most pay? Leaving the employer out of the question altogether and in fairness to the men, such a system is necessary, and we believe that the premium and piece-work systems are the best solutions to the question that we have to-day. When such a system is adopted we find less power going to waste, the output is largely increased, men avoid accidents and de-

lays and the men's intelligence is quickened.

Have a Shop System.

A general shop system has been hinted at, a general plan that may be followed, but the managers must make the system they adopt their own. Success in obtaining the true costs will be aided by the system, a system applied in your own way to suit your own conditions. System alone, however, will not keep the work on time. It supplies the means by which it may be done and it remains with the superintendent to know the value and get the results. It is like an indicator diagram on an engine, and just as the indicator diagram shows whether or not the work is being properly and efficiently done, so with a proper cost system. A certain amount of experimenting may be necessary to get the facts wanted into proper shape so that the superintendent can see at a glance the efficiency of the plant and defects in operation, things he could not get either by inspection or operation. A system cannot be jumped at in a day, but the time and money will be well spent perfecting such a system, and when brought into working shape it will be only then that the manufacturer will realize what a valuable asset a cost system is to the firm.

Dealing With Men.

I have mentioned that increasing the pay of a mechanic in the shape of higher wages as piece-work or premium, tends to quicken his intelligence. Men who have made a scientific study of economic problems, capital and labor, tell us that a first-class man with favorable conditions will accomplish from three to four times as much work as an average man. Then the premium and piece-work systems tend to make first-class men. It develops them. And when a man is fitted for a higher grade of work give it to him. Do not put a first-class mechanic on work that a lower-priced man could do. No one would ever think of hitching a trotter such as "Dan Patch" to a plow. It would unfit the horse for faster work. So with a mechanic. He would be unfitted for finer work. Good men work at high speed if paid well. Of course there must necessarily be a limit to the wages. An example of this was seen in Kingston, Ontario, a few years ago when probably the largest stove foundry in Ontario was compelled to close its doors. The workmen struck for higher wages and obtained their requests. The second time the men walked out, and probably against the employer's better judgment, he again granted them their requests, but warned them that another strike meant closing the works. The workmen thought only of the "enormous" profits and went out again. They had forgotten about the enormous expenses, and the manufacturer was compelled to close down. Lack of knowledge, mutual suspicion and misunderstanding between men and their employers is probably the greatest drawback to the piece-work system. Probably it is because of this misunderstanding and suspicion on the part of the men that we have what has been termed "soldiering." That is, taking an hour to do a certain job that should be done without difficulty in much less time, probably half an hour or twenty minutes. Some men are naturally slow and easy. They have been used to putting in time and it is only after many examples and probably some external pressure that they develop a more rapid gait.

BORING CAR WHEELS.

How to bore forty car wheels per day, in a lathe, by a very inexpensive and simple method.

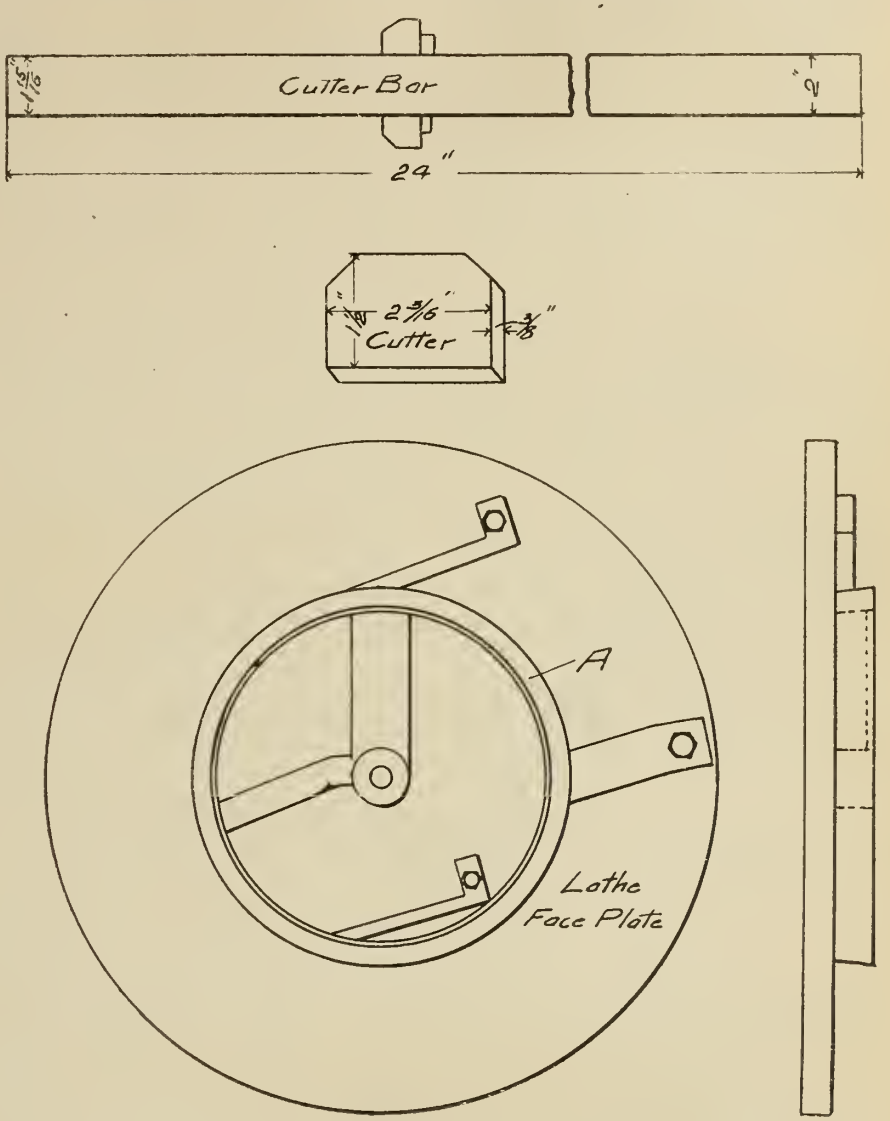
Make a casting like figure (A), in the accompanying illustration, and bolt to the face place of the lathe; then place the car wheel in the casting, and tap all around until the wheel is firmly in place. Place the cutter-bar through the cored hole of the car wheel, and then into the gig behind. Place the other end of cutter-bar in the tail-stock centre and ram through. Pull the bar out; and loosen the wheel from the casting, which is finished with the one cut.

For the cutter-bar, take an ordinary piece of 2-in. steel and turn 8 inches down to 1 15-16 inches, making the end fit the hole in the gig. Then slot the bar for the cutter, making one side taper to suit the key.

For the cutter, take a piece of 3-8 x 1 1-2-in. steel and cut off 2 1-4-in. long. Then place in the bar and turn to 2 3-16 inches. Then grind clearance and temper.

A person wishing to bore different size holes in car wheels must have a complete set of cutters.

N. C. JOHNSON.



Boring Car Wheels.

Practical Questions and Answers

Question— Will you please give information and formulas used in the design of the main parts of small gas engines ?

Answer—According to the authority these formulas differ considerably. For a simple stationary gas engine, trunk piston and single acting, some simple and handy formulas have been compiled at Cornell University, the constants and coefficients having been obtained for the most part as a result of an investigation of current practice in gas engine design.

The following symbols will be used :

d = diameter of cylinder in inches.

l = length of stroke in inches.

p = is the maximum. pressure during normal operation, this varies from 250 to 350 pounds, but an average value is 300 pounds per square inch.

First there is the thickness of the cylinder walls. This is represented by t, and it depends upon the safe working stress for cast iron, s.

$$t=\frac{pd}{2s}+\frac{1}{4}$$

For this class of work a safe value of s is 2,450, and substituting :

$$t=0.000204\ p\ d+\frac{1}{4}$$

Substituting the average value of p, we have :

$$t=\frac{d}{16}+\frac{1}{4}$$

The thickness of the jacket wall, T, and of the water jacket space, j, are determined to a great extent by consideration of moulding and casting, but also depend on the thickness of the cylinder walls, t.

$$T=0.6\ t \text{ and } j=1.25\ t.$$

An emperical formula is given for the number of studs in the cylinder head, q.

$$q=\tfrac{2}{3}\ d+2$$

the nearest whole number, of course, being used.

The outside diameter of the studs, o, may be obtained from this formula, s being maximum working stress allowable at the root of the thread :

$$o=\frac{1}{\sqrt{0.7\ s}}d\sqrt{\frac{p}{q}}$$

Considering the value of s to be 7,800,

$$o=0.0135\ d\sqrt{\frac{p}{q}}$$

If p has the value, 300, and q is 8, this formula reduces to :

$$o=d/12$$

The length of the piston, L, is found as follows :

$$L=\left(\frac{\pi}{4}\cdot\frac{0.22}{b}\right)\frac{p\ d}{u}, \text{ where}$$

b = bearing pressure on the projected area of piston, L d sq. inches.

and u = ratio of the length of the connecting rod to the radius of the crank.

The usual value for u is 5 and for b, 7 pounds per sq. inch. Then,

$$L=0.025\ p\frac{d}{5}$$

giving p its usual value, this reduces to :

$$L=1\tfrac{1}{2}\ d$$

The bearing pressure p on the projected area of the piston is due to thrust of the power stroke and the weight of reciprocating parts.

The thickness of the rear wall of the cylinder, z, is given by :

$$z=\left(\frac{0.41}{\sqrt{s}}\right)d\sqrt{p}$$

If this wall is ribbed, as it usually is, a high value of s may be allowed, 5,320.

Then,

$$z=0.00562\ d\sqrt{p},$$

or giving p its value, 300,

$$z=d/10$$

The length and diameter of the piston pin, l'' and d'', are given by :

$$d''=d^4\sqrt{\frac{\pi}{4\ s\ b}}\sqrt{p}$$

and $l''=d''\sqrt{\frac{\pi}{4}\frac{s}{b}}$, when the piston pin is considered as a beam, and

s = stress in pin, and

b = bearing pressnre on projected area of pin.

Allowing s = 10500 and b = 2800, $d''=0.0218\ d\sqrt{p}$ and $l''=1.75\ d''$, and this again reduces to :

$$d''=0.21d \text{ and } l''=1.75d''$$

The area of the mid-section of the connecting rod, a, is given by :

$$a=\frac{k}{44{,}560}\ p\ d^2\left(1+\frac{0{,}00012c^2}{r^2}\right)$$

where k = factor of safety for the connecting rod

c = distance from centre to centre of rod

and r = radius of gyration of the middle section

Giving k the value 3.9,

$$a=0.0000875\ p\ d^2\left(1+\frac{0.00012c^2}{r^2}\right)$$

If the cross-section is circular, having a diameter D, $r^2=\frac{D^2}{16}$. If it is rectangular, having a height, h, $r^2=\frac{h^2}{12}$. This part of the formula, $\left(\frac{1+0.00012c^2}{r^2}\right)$, usually equals 1.6, and in this case the diameter of the mid-section is :

$$D=0.23d$$

This equation gives the diameter of the crank pln, $d'''=\sqrt[3]{(4/s)}\ Mpd^3$, where s = working stress and M = is the arm of the effective bending moment on the crank-pin for the stress caused by the reaction on the main bearing due to the explosion, and $=m-(\tfrac{3}{8}\ l'''+\tfrac{1}{4}l')$, where $m=\tfrac{1}{2}$ distance from centre to centre of main bearings; l''' = length of crank-pin journal and l' = length of main bearing journal.

Allowing s = 10,600

$$d'''=\sqrt[3]{0.000379Mpd^2},$$

and making p = 300 and m = 0.6d. as it usually is :

$$d'''=0.41d$$

The length of the crank-pin journal, l''',

$$l'''=\left(\frac{0.145\pi}{4b}\right)\frac{pd^2}{d'''} \text{ where}$$

d''' = diam of crank-pin.

b = average bearing pressure on the projected area of the crank-pin (d''' l'''), due to the average value of the load during a complete cycle. b is about 14.5 per cent. of the maximum load due to the explosion.

Assuming the value of b to be 213, the formula becomes :

$$l'''=0.000\cdot35p\frac{d^2}{d'''}$$

If p is 300 and if d''' is 0.41d,

$$l'''=0.95d'''$$

If x be the thickness of the throws of a centre crank engine and y the breath, then

$$x=\tfrac{5}{8}d''' \text{ and } y=2\tfrac{1}{8}x$$

The diameter of the crank shaft on main bearings, d, is given by :

$$d'=\sqrt[3]{\left(\frac{4}{s}\right)\ pd^2M^1}, \text{ where}$$

M' = 0.325 l' + 0.090 l, being the arm of the effective bending moment on the crank-shaft at the inner edge of the main bearing for the stress caused by the reaction on the main bearing due to explosion,

and l' = length of main bearing journal.

Giving s the value 9,500,

$$d'=\sqrt[3]{0.000422pd^2M^1}$$

and if p = 300 and $M^1=0.4d$ as is usual,

$$d'=\tfrac{3}{8}d$$

The length of the main bearing journal l' is :

$$l'=\left(\frac{\pi}{24b}\right)\frac{pd^2}{d'}$$

Here b is usually 123, and then,

$$l'=0.001068p\frac{d^2}{d'}$$

If p = 300, and $d'=\tfrac{3}{8}d$, then

$$l'=2\tfrac{1}{4}d'$$

The outside diameter of the flywheel, D, is :

$$D=\left(\frac{12v}{\pi}\right)\frac{1}{N}, \text{ where}$$

v = velocity of rim in feet per minute, and N = r.p.m.

A safe value of v is 3,220 feet per minute, and then,

$$D=\frac{12{,}300}{N}$$

The weight of the flywheel is :

$$W=\frac{272{,}300{,}000000}{F}\frac{A}{D^2N^3}, \text{ where}$$

F = speed fluctuation co-efficient, about 0.054 usually.

B = rated brake horse-power.

D = diameter of the wheel, and

N = r.p.m.

Substituting for F = .054, we have

$$W=5{,}000{,}000{,}000{,}000\frac{H}{D^2N^3}$$

Substituting for $D=\frac{12{,}300}{N}$,

$$W=33{,}000\frac{A}{N}$$

It will be noticed that these formulae, by assuming certain average values for certain quantities, are simplified to a remarkable degree. These formulæ have been elaborated upon and are more fully explained in "Elements of Gas Engine Design," by S. A. Moss, formerly at Cornell University.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

Science in the Foundry*

By William H. Hearne

THE selection of pig iron, its mixing and melting in the foundry, are becoming a matter of much more interest than formerly. Twenty-five years ago there was not a foundry that had a chemist in its employ, and scarcely a blast furnace running on foundry iron had a laboratory. Foundry pig iron was bought, sold, and mixed, entirely by its appearance and the experience the foundryman had had with the same brand previously. At that time this was a comparatively safe and satisfactory method to pursue, for the reason that at that time the ores and fuel from which each furnace made its product were largely drawn from local sources, and the name of the district in which the furnace was located told from what the iron was made.

The great growth of the iron industries since that time, the development of the railroad systems and the increased facilities the railroads offer for the assembling of materials, the discovery and development of coking-coal fields, the development of the Lake Superior ore fields, and the cheapness with which this ore can be transported on the Great Lakes to widely distant points have changed this situation entirely.

This makes it necessary for the foundryman to know either the analysis of the pig iron, or the ore and fuel that are used.

The chemistry of foundry practice is one of elimination, and this has been the cause of a most limitless specifications. Really there is practically no positive knowledge, but all knowledge is acquired by experiments, and most of these experiments have been made by men having preconceived ideas of the results to be attained. This, of course, is natural, and is probably the only way to go about it. The result is that an experiment is made with iron running silicon, 2.50, phosphorus 0.80, sulphur 0.035, manganese, 0.40 and the experimenter discovers that he has made a satisfactory casting. Consequently, when he wants an iron for this kind of work he demands iron of exactly this analysis, not knowing whether or not, if he had iron of silicon 2.00, phosphorus 1.10, sulphur 0.05, manganese 1.25, he would get the same result and possibly a much better and sounder casting; for the phosphorus is if anything a greater fluidizer than the silicon, and the manganese is a powerful oxidizer. When the second iron is melted he would lose at least one-third of the manganese, and with it would go the sulphur from his iron and possibly some picked up from his fuel. This will be especially true if he will tap his iron from the cupola into a big mixing ladle so as to give the manganese time to act.

The fact of the matter is that the foundry cupola is a very poor thing in which to make a mixture of iron, and very little reaction goes on there beyond the loss of a little silicon and the taking on of some sulphur. Besides, the slags of most cupolas are too acid, and much manganese is lost which ought to be carried forward into the mixing ladle, when it could be used to eliminate the sulphur. There is not nearly enough lime or fluorspar used by foundrymen. If the ordinary foundryman would introduce a little fluorspar into his molten iron, he would be surprised at the amount of sulphur he would smell.

There are four things necessary for a good foundry mixture: fluidity, soundness, softness and strength. How is fluidity to be attained? First, by hot melting; second, by the presence in the pig iron of certain alloys—carbon, silicon, phosphorus and manganese—and by freedom from sulphur. Practically pure iron is white and will not run at all, but will melt into a sponge and burn before it will run.

In ordinary foundry pig iron there is about 93 per cent. of metallic iron and about 7 per cent. of alloys, and it is the proportion of these alloys to each other that determines the character and grade of the iron.

The real softness of a casting depends on the total amount of carbon and on the proportion of graphitic to combined carbon. This every foundryman knows, and the real problem is how to get the proper proportion. Every foundryman knows that one sure way is to anneal the casting or to cool it slowly. This is expensive and only to be done when he has failed to handle his mixture or his pouring properly.

In pig iron the proportion of free, or graphitic, to combined carbon depends entirely on the rate of cooling, and the slightest accident at the time of casting will affect this proportion and will change iron which should be 2X foundry to 2 plain or 3 foundry. In the old days many blast-furnace men took advantage of this fact and made their pig molds short and fat so as to open the grain. As a result iron, that in silicon and sulphur would have been 2 plain, by cooling slowly became 2X foundry. Really, however, there are more chances for the furnaceman to lose than to gain, as anything which impedes or interferes with the running of the iron will tend to combine the carbon, and it is a common thing to get 1 X, 2 X, and 2 plain or 3 foundry iron in the same cast, in which case all three grades will have the same silicon, sulphur, phosphorus and total carbon, and will vary only in the proportion of combined to graphitic. All this relates to the mechanical causes of the proportion of the carbon.

Chief among the foreign elements in pig or cast iron that affect the carbons chemically is silicon. This element has the property of throwing out of solution the carbon in the graphitic form, and many melters seem to think it the only cure for all hard iron. Everything else being equal, it is safe to say that an iron carrying 2.50 per cent. silicon is a softer iron than one carrying 2 per cent. silicon. Silicon is not in itself a softener; it acts so only by affecting the carbons. An iron with 10 per cent. silicon can scarcely be drilled. Pig iron with 4 per cent. silicon will not contain as much total carbon as one of 2.50 per cent., as the silicon unites with the iron and robs it of some of its carbon; so that a high silicon pig iron never has the dark, open fracture of a 2.50 to 3 per cent. silicon iron.

Sulphur is the most dangerous enemy of soft, sound castings, as it not only tends to combine the carbon, but by doing this also causes the grain to close up quickly, and to retain in little holes or sacks gases which might and should

* Abstracted from a paper presented before the American Association for the Advancement of Science at New York.

escape. In this way it causes the casting to pit and be porous.

If iron can be kept fluid long enough the sulphur will all rise through the iron and pass off, as can easily be proved by drilling holes in any piece of iron of reasonable size, poured in open sand. If three holes are drilled, one above the other, the proportion of sulphur in each set of drillings will vary as the height. This was demonstrated ten years ago by Guy R. Johnson in a series of more than a hundred experiments. The problem, then, is to give the sulphur a chance to get away before it is locked in the casting. There are many ways to do this, but the simplest and easiest is by using an iron carrying a fair percentage of manganese, with a large mixing ladle. In special cases it can also be done by putting into the mixing ladle a small amount of pulverized ferro-manganese, or a small amount of fluorspar or of aluminum. Any of these additions will cause the iron in the ladle to boil, and during this boiling the sulphur will be thrown off, and, as your molder will say, the iron is cleaned. Being free from sulphur, your casting will be soft, as it will have the proper proportion of graphitic carbon. Most of the so-called patent fluxes for making semi-steel castings are nothing but pulverized ferro-manganese, fluorspar, and pulverized high ferro-silicons. Every foundryman can obtain these alloys himself and make his own fluxes.

There is a brand of iron made in Virginia, from ores mined on the property smelted with coke, made by the company that demonstrated the futility of grading pig iron by silicon and sulphur alone. A certain foundryman took an iron made in Western Alabama, analyzing: Silicon, 3.25 per cent.; phosphorus, 0.90 per cent.; sulphur, 0.05 per cent.; an iron from Birmingham, analyzing about the same, except that the phosphorus was about 0.75; and the Virginia iron, analyzing: Silicon, 1.50 per cent.; phosphorus, 1.15 per cent.; manganese, 1.00 per cent.; sulphur, 0.005 per cent.

The three irons were melted under identical circumstances and were poured into molds 1 inch wide, ½ inch thick and 14 inches long, for a fluidity test. The first iron filled the mold for 9⅜ inches, the second for 8½ inches, the third for 14 inches, and the foundryman said he thought if he could have got the end of the mold out quickly enough, it would have run to the end of the shop. This of course was an enthusiastic exaggeration, but the test settled in that foundryman's mind that phosphorus and manganese were elements that affected the fluidity of iron fully as much as silicon; also that an iron that had this fluidity must also be low in sulphur. The product of this furnace is used almost entirely by foundries making steam, gas, and air cylinders, ammonia valves, and other castings that need to be dense and free from pinholes and yet soft enough to be reamed and cut.

The casting of pig iron in chill molds has very little, if any, effect on the character of the iron, especially if the foundryman uses a mixing ladle. It does not affect the total carbon at all; if anything it rather increases the amount of this element, for the reason that the surface of the pig iron is cooled quickly, in this way preventing the throwing off of "kish," which is so evident in a cast house when running "hot" iron. It somewhat increases the total combined carbon, owing to the sudden cooling or chilling of the surface; but if the iron contains the proper amount of alloys and is melted hot and tapped into a mixing ladle the casting will be as satisfactory in every respect as though the pig iron had been sand cast. In addition the chilled casting eliminates one source of trouble, i.e., the sand or other dirt in which the sand-cast pig iron is run.

A test was made several years ago by taking a pig of sand-cast iron, weighing it, pickling it, and then re-weighing. By calculation it was found that the particular brand of metal carried 70 pounds to the ton of sand. This adds just so much to the impurities to be contended with. In addition, it is a fact that iron free from sand melts more quickly than iron coated with it.

The Foundry Core Room †

By Geo. H. Wadsworth, Supt. Falls Rivet and Machine Company, Cuyahoga Falls, Ohio.

FROM personal observations of the writer, the majority of core rooms have but very little attention whatever given them from the principal heads of the foundry departments. A great many core rooms in times gone by were located in some out of the way place, or in some dark corner where it was a hard job to find them at all. This applies principally to small jobbing foundries, and we must give credit to modern foundries which have been built within recent years, and in which we can say that the core rooms are as well taken care of as regards room, light and equipment, as any other part of the foundry. But there is still room for improvement in a great many modern core rooms by the installation of core room equipment and appliances, and the giving of the necessary care and instructions, as well as in any other part of the foundry.

Customs are now changing. Since the installation of core room machinery our core makers are getting more familiar with it, and how to take care of it. How did this come about? We all know that in a machine shop custom educates boys to use the oil can and take care of the machines they are operating, and this is just as necessary in a core room. Was it done when core machines were first being introduced in the core room? I say no. I have personally gone into a core room after a machine had been installed and found it had never been oiled since it was received, and when an oil can was asked for it would take from fifteen to twenty minutes to find one, and when found the probabilities are that the oil would not be fit for use. But times are changing. When the men and boys take as much care of their tools and equipment in the core room as is the case in the machine shop, core machines and equipment will last considerably longer and will give a great deal more satisfaction, and it will certainly educate the core makers to have a more observing mind.

The oil can has been merely used as an example to show that small things have not been taken into consideration in the core room. Now, if so little attention is given to small matters, how much is given to the larger ones which are more costly. Core making machinery and equipment is becoming more generally used every day, and from the building of one type and operating of same, which machine made cores from ⅜ in. to 1½ in., we have to-day five different sizes and types of machines, which all originated from the ⅜ in. to 1½ in., which is generally known as the sausage-stuffing type. This machine was built and put on the market about August, 1901. The same machine was afterwards increased in size and became a standard at 2¼ in. for two or three years, until the writer designed and built a machine to make up to 5 in., for which he afterwards made larger dies and increased it to 7 in. At that time it was supposed that this would have to be a power machine, but we will be pleased to demonstrate to you gentlemen to-day the making by hand of a 7 in. core 24 in. long in from 15 to 20 seconds. Another type is our speed changing core machine which has a slip gear and can be changed in speed for small and large cores.

† A paper read before the New England Foundrymen's Association, Boston, February 13th.

Machinery Development

Metal Working **Special Apparatus** **Wood Working**

NEW LONDON MACHINE TOOL LATHE.

THE accompanying illustration is of a new lathe, which has just been placed on the market by the London Machine Tool Co., Hamilton, Ont. As may be seen from the illustration, this lathe is built in the most up-to-date style; and has been designed for use with high speed steel. The illustration shows that power is transmitted through the spindle from the countershaft through a single pulley and gearing enclosed in the head. For each change of belt speed there are four changes of spindle speed. A three-speed countershaft is provided, thus allowing twelve changes of spindle speed, ranging from 12 r.p.m. to 300 r.p.m. On the 22-in. lathe the driving belt is 5 ins. wide, and the driving pulley 14 ins. in diameter.

The spindles are of crucible steel, accurately ground; and the spindle bearings are of self-oiling lumen bronze. Spindle thrust is taken up by ball bearings working against hardened steel rings.

A feature of the feed mechanism is the automatic stop, which throws out both rod and screw feed. This feature is particularly valuable when working up to a shoulder, or in cutting threads up to a shoulder. Forty changes of rod, screw and cross feeds can be obtained. There is a safety device for preventing the rod and screw feeds from becoming locked together. The compound rest and cross sides are provided with micrometer valves. The carriage is very heavy, and has very long bearings on the V's, as may be seen.

Prize Drafting Outfit.

The tail-stock is heavy; and the spindle in the tail-stock is locked from beneath, thus preventing its being thrown out of line when clamped.

Well-arranged time is the surest mark of a well-arranged mind.—Pitman.

COMPLETE DRAUGHTING OUTFIT AS PRIZE.

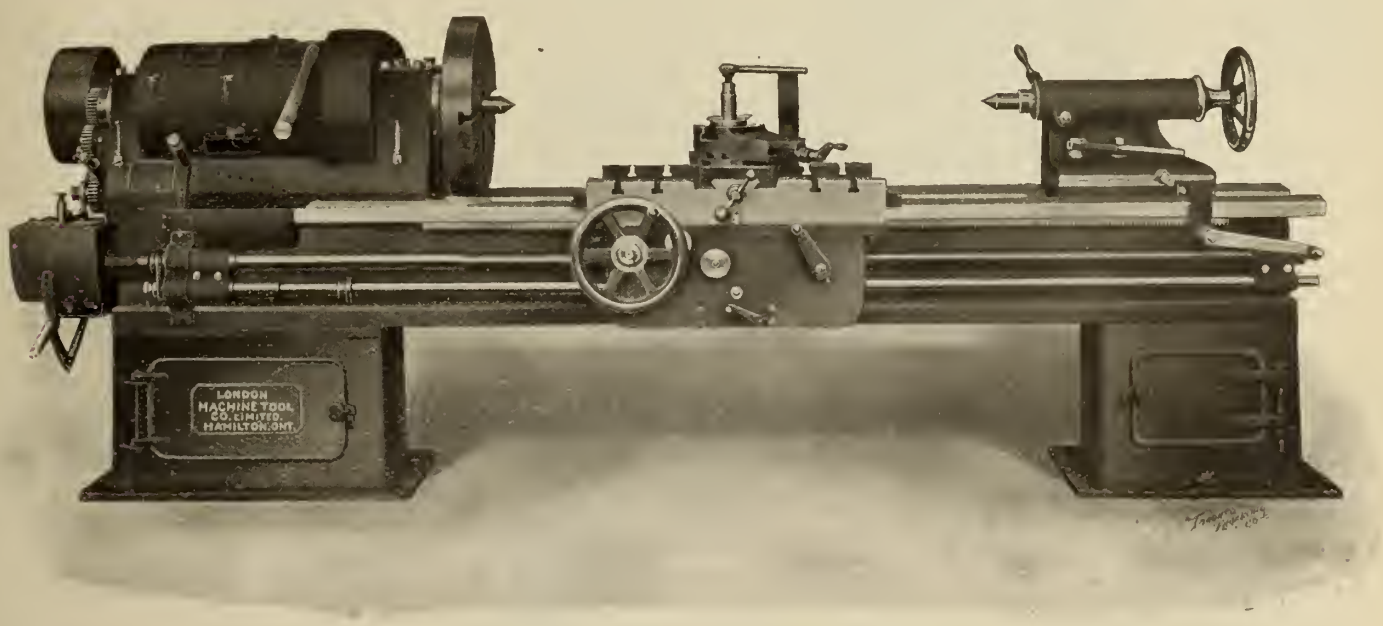
The accompanying illustration shows a complete draughting outfit, including a full set of German silver instruments, which Fred. W. Dobe, M.E., chief draughtsman, Engineers' Equipment Co., Chicago, is offering to his students as a premium for the best set of drawings made by them during their course.

This system of home instruction in draughting, as inaugurated by Mr. Dobe, is modelled after the leading practical schools of this kind in Germany.

IMPROVED GAP ENGINE LATHE.

AN improved gap engine lathe has just been placed on the market by the Rahn-Carpenter Co., Cincinnati, Ohio, which is shown in the accompanying illustration. This lathe is designed especially to meet the requirements of repair shops or other shops where there is a large range and variety of work to be done.

The gap bed in this lathe is rigidly constructed so as to be strong enough for any work within the range of the lathe. The gap allows the working of pieces of large diameter within the range of the gap, as satisfactorily as in a lathe of much larger proportions. An extra piece is furnished to fit into the gap when the full swing of the lathe is



New London Machine Tool Lathe.

not desired; this gives the carriage a full bearing on the V's when the tool is being used close to the head stock.

The lathe has both longitudinal and cross feeds ranging from twelve to one hundred; and will cut threads from 2 to 40 per inch. The lathe is back geared, with a ratio of 10 to 1.

These lathes are built in sizes 16-23-in. swing, 18-25-in. swing, and 20-26-in. swing.

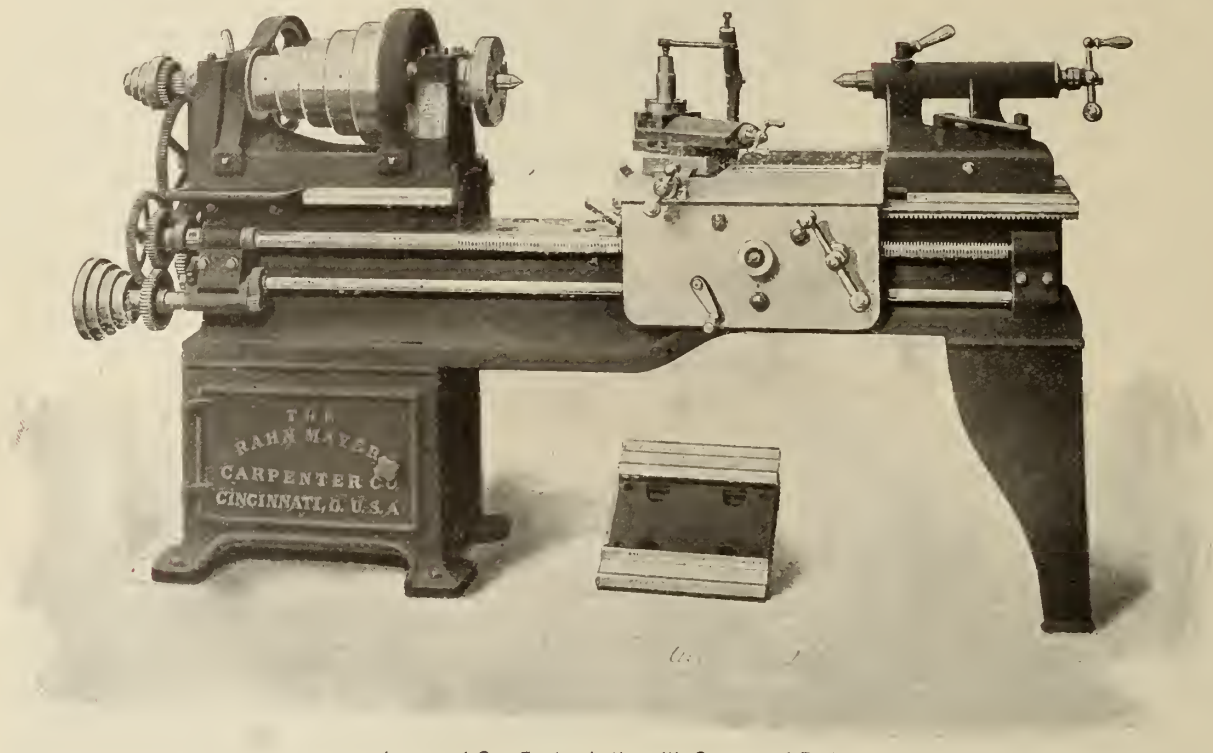
*Improvements in Industrial Hygiene**

THE past decade has witnessed a most remarkable advance in the improvement of working conditions for the operators in our manufacturing establishments. While the manufacturer has, to a great extent, voluntarily introduced such improvements, and has witnessed in their introduction an increase in the efficiency and longevity of his workers, the pressure of the law has in many cases been necessary to force him to meet the requirements.

ventilation secured with certainty by the introduction of an exhaust fan. This should properly be of the cased or enclosed centrifugal type, the disc or propeller type being only suitable for operating against slight resistances.

Rattling and tumbling barrels may be rendered innocuous by exhausting through hollow trunions or from housings built over the tumblers. An exhaust system in connection with the sand blasting room will greatly improve

perly applied a vacuum of from one to one and a half ounces is sufficient with a proper system of hooding to handle all dust in installations such as are here presented. If, however, the wheels are not properly hooded or the system not properly laid out, even a four ounce vacuum may hardly prove sufficient to give satisfactory results. Hence it behooves one to accept the advice of those experienced in this class of work. When it is known that the power of a fan increases as the cube of the speed it becomes evident that a slight saving in the cost of the initial installation may be quickly absorbed in the added expense to operate the fan at unnecessarily high pressure. A fan at four ounce speed will require eight times the power necessary to operate it at one ounce speed. In numerous instances ex-



Improved Gap Engine Lathe with Compound Rest.

Just now exhibitions are being held in various cities where appliances for safeguarding the person and the health of employees are displayed. Important among the devices for improving atmospheric conditions in crowded, hot, dusty, ill-smelling or badly ventilated work-rooms is the fan blower.

Although the blower is very generally installed in connection with a heater as part of a mechanical system of ventilation and heating, local application as is usually necessary where the vitiation is excessive, in the metal working trades, for instance, the fan finds a broad field of application.

In the brass foundry hoods may be introduced over the brass furnaces, and the conditions under which the workman operates.

Probably the greatest need of exhaust ventilation in the metal industry exists in connection with buffing, grinding and polishing processes. The high speed of rotation of the wheel tends to throw the fine particles of dust or lint directly into the atmosphere which soon becomes surcharged therewith. Each wheel is usually enclosed in an individual hood rigidly supported and connecting through an exhaust pipe to a horizontal main laid just behind the grinders and thence to the fan. Each connection is provided with a blast gate.

The fan speed required for an exhausting system depends largely upon the material to be removed. When pro-

isting installations have been remodelled, larger fans installed, new hoods introduced and such a marked saving made in the running expense as to pay for the new installation inside of a year.

* Supplied by the B. F. Sturtevant Company.

RECENT PROGRESS IN ELECTRIC FURNACES.

At the fifth annual meeting of the Society of Practical Science recently, a paper was read by Mr. S. Dushham on the recent progress in electric furnaces. He was of the opinion that where water power could be obtained, the iron ores of Ontario, which are refractory, and high in sulphur, could be smelted in the electric furnace at a cost that would compete with the blast furnace.

Power and Transmission

Steam Gas Electricity Compressed Air Water

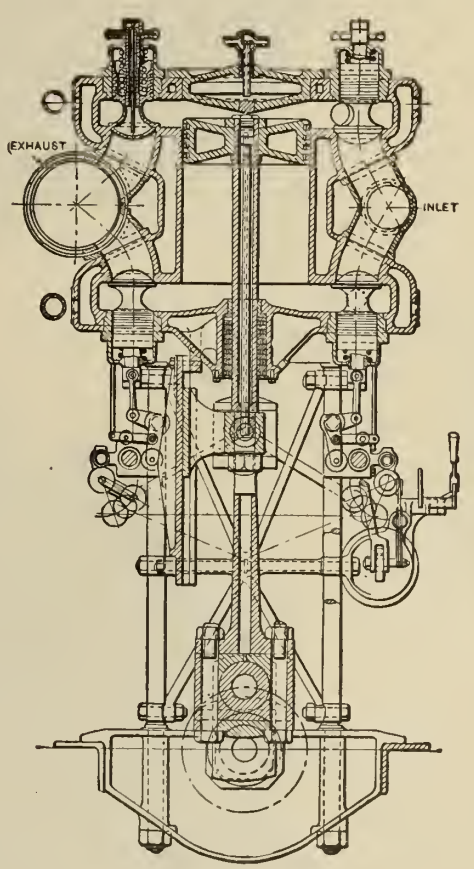
NEW TYPE OF GAS ENGINE FOR MARINE WORK.

THE following description is given by Commander A. B. Willets, in the Journal of American Society of Naval Engineers of a new type of gas engine for marine work :

There will be no future for the single-acting motor for large powers in marine work. The manifest advantages in the matter of weight and arrangement for variations in cruising powers, as well as in greater effectiveness in distribution in the double-acting type, will make it unquestionably the only one to be considered in the development of this class of machinery for sea-going craft. The difficulties at first experienced in arranging for the proper cooling of pistons and rods, and in devising efficient packing for the rod stuffing boxes, have been overcome, and, as before noted, examples of double-acting gasoline motors of 500 horse-power are already in satisfactory operation afloat.

It will be seen in the accompanying illustration that the valves are positively operated, water-cooled, and balanced. The pistons are cooled by water circulating through the cross-head, up a tube in the piston rod, providing a return circuit around this tube. A regular reversing controlling cylinder is used with compressed air instead of steam, bringing the reversing under perfect control. Means can also be provided by which, with one motion of the lever, all the lower exhaust valves can be lock opened and all the lower inlet valves can be lock closed instantly, thus changing the engine at once to a single-acting six-cylinder motor, or, in other words, cutting down to half power with one movement and without any substantial decrease in economy. Furthermore, the two units of three cylinders each can be unclutched, so that the after three cylinders can be operated alone single acting, which actually reduces the power to one-quarter of the original. Taking these parts into consideration, together with the fact of being able (with a liquid primary fuel) to get under way at a moment's notice under full power and maintain absolute regularity of speed as long as the fuel lasts, there seems to be little more to be desired toward securing an ideal marine motor, and, even should producer gas be used, the same control of the variations of the power is maintained, although the ability to instantly start from cold port conditions is not secured, there being, of course, some delay in getting the fire properly under way in the retort.

The carbureter of this engine is controlled by the throttle-valve lever at the reversing cylinder. The inlet valves for compressed air are on the back, and not shown, but are merely applied in this type to the lower ends of the three after cylinders, so that the three upper ends of these cylinders and the entire three



New Type of Gas Engine for Marine Work.

forward cylinders are constantly "on" gasoline, either in the go-ahead or backing position of the cam shafts ; and, as the sparking continues in all cylinders during the action of reversal, the very moment the compressed air starts the engine in reverse the other cylinders immediately take up action with gasoline, and the engine is running on explosive fuel immediately, so that the action of the compressed air is not practically more than the shifting into reverse motion and starting the engine in the desired direction. The moment this results the reverse lever is shifted to the full-throw notch, which restores the lower ends of the after cylinders to gasoline. This reversal is practically instantaneous. All the cam shafts are positively driven by gearing from the main shaft, and, consequently, the adjustments of the cams are exact, and the tripping of the valves in this arrangement is accomplished almost noiselessly.

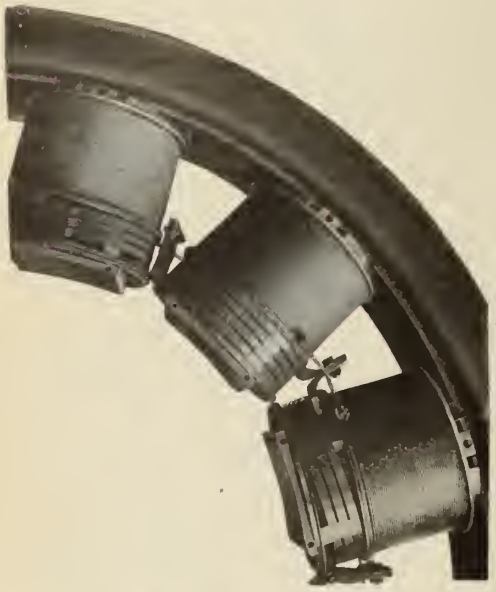
The lubrication of this motor is also a very interesting feature. Forced feed with sight-feed adjustment is accomplished through plunger boxes shown on the after end of the motor, the upper box being for delivery to the centre of each cylinder, and the lower box for delivery to the middle of the piston-rod stuffing boxes, the plunger pumps for each of the small pipes being worked by a lever with a small connecting rod to a pin on the end of the exhaust cam shaft, which gives sufficient rotary motion for the desired lift, the lift being also further regulated by a slot in the plunger lever, to which the connecting rod is attached. The lubrication for the crossheads and crank pins is accomplished by a small plunger pump worked by a gear at the forward end of the exhaust-cam shaft, similar to the gasoline pump shown at the forward end of the inlet-valve cam shaft in the photograph, the oil being kept in a constant flow from the crank pit into which it falls, up through a strainer box between the two sets of three cylinders (and just seen in the photograph), back of the middle branching of the inlet pipe, and fed by gravity from this tank to the journals ; a surplus of oil being constantly circulated by this method and kept constantly strained without waste. The journals are of ample dimensions and give no trouble whatever from heating with this system of lubrication.

PETROL ENGINE OMNIBUSES.

Three single deck omnibuses equipped with 40 h.p., 4-cylinder petrol engines, have been built by Halleys' Industrial Motors, Ltd., Glasgow, Scotland, for public service in Canada. Two gearing, three forward speeds of 4, 8 and 12 miles per hour, and one reverse speed of 3½ miles per hour, can be obtained.

NEW BULLOCK GENERATOR.

A NEW generator is being placed on the market by the Allis-Chalmers Co. and will soon be available on the Canadian market through Allis-Chalmers-Bullock of Montreal, who have the rights of all lines manufactured by the parent companies. This arrangement gives the Canadian firm the advantage of the extensive engineering staff and its broad experience for the working out of any problem involved in mechanical or electrical engineering. Any machine brought out by the United States company is thus immediately at the disposal of the Canadian firm, the same being true of any improvement on a machine or any mechanical or electrical contrivance of any kind. The latest from the works of the parent company is a small type generator, which is shown in the accompanying illustrations. The views showing the pole

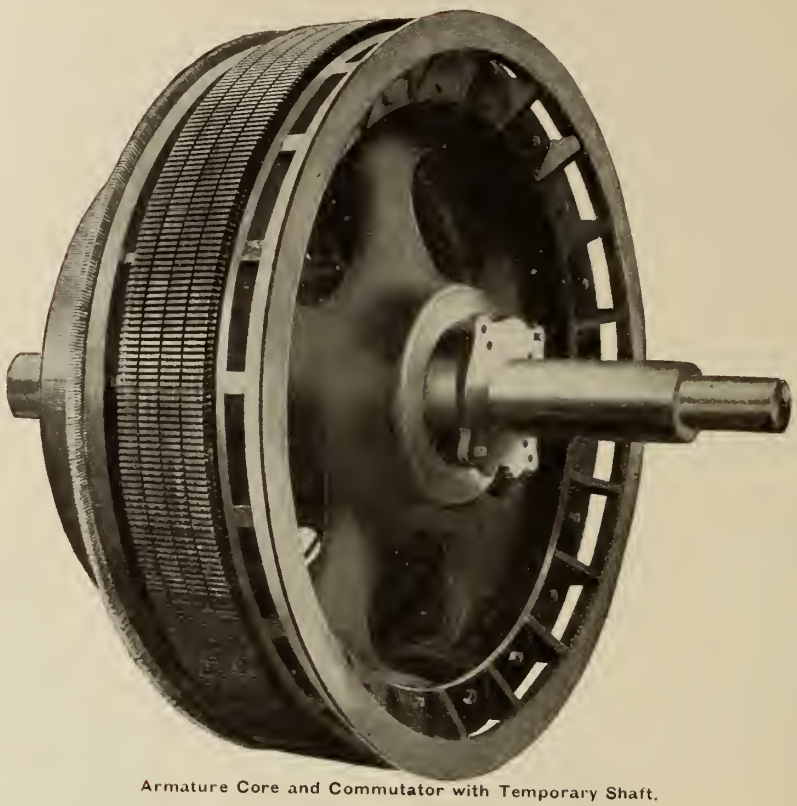


A Section of the Stationary Field.

pieces, a section of the stationary field, the brush oscillator, the armature core and commutator with temporary shaft and the generator complete, except shaft, will give a better idea of this new machine than many pages of descriptive matter.

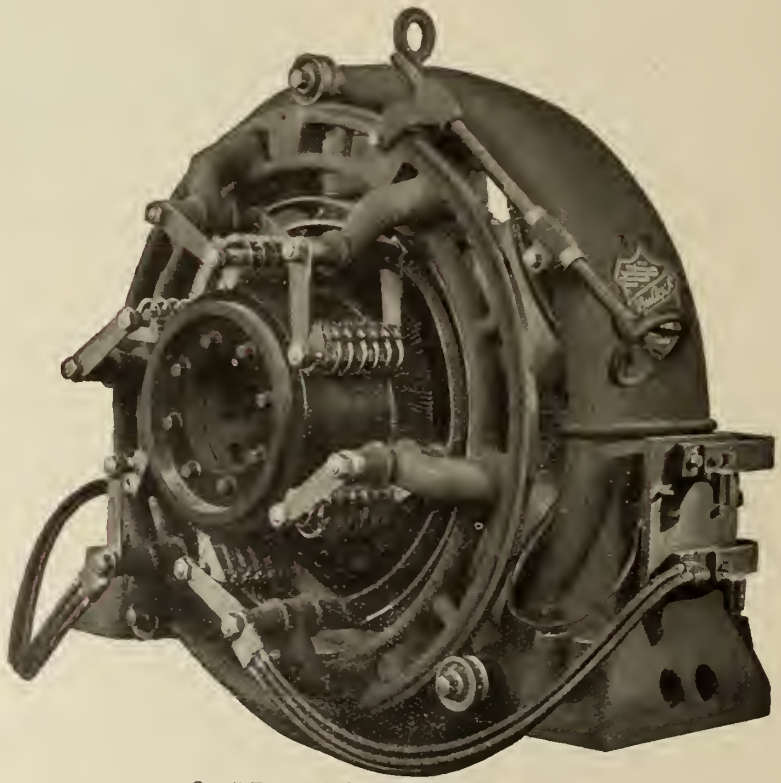
MASSIVE ROLLING MILL ENGINES.

Two of the four large Allis-Chalmers rolling mill engines which have been purchased by the Carnegie Steel Co. for the Edgar Thompson Works, Pittsburg, Pa., have now been completely installed. These engines are of immense size, being the largest engines for rolling mill service yet built. They have cylinders 50 and 78 inches in diameter, with 60-inch stroke. The frame and slide of one of the engines was cast in a single piece and weighs 104 tons.



Armature Core and Commutator with Temporary Shaft.

The valve gear used on these engines is the Reynolds Corliss type, driven by two eccentrics and designed for long range cut-off. The high pressure cylinder is placed in tandem behind the low pressure. The engines operate non-condensing under a steam pressure of 150 pounds, and at a speed of about 75 r. p. m. Under these conditions a maximum indicated h.p. of 8,000 is developed by each engine.



Small Type "I" Generator (Without Shaft).

Industrial Progress

CANADIAN MCHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

A million dollar drydock is talked of for Port Arthur.

The Northern Plumbing and Heating Co. has dissolved.

Young Bros., Almonte, have sold out their foundry business.

The Down Draft Furnace Co., of Galt, will build a large addition.

Lamontagne & Bayard have registered in Montreal as contractors.

Jas. H. Edmonds & Co., metal spinners, Toronto, have assigned.

Joseph Guilbault & Co., have registered in Montreal as contractors.

A million dollar refinery to treat Cobalt ores is talked of for Hull.

A large addition has been begun by the Ottawa Steel Castings Co.

A new furniture factory employing 40 or 50 men will be erected at Elmira.

The Reeves Engine Co. is planning to build a large warehouse in Regina.

Beaucage & Beaucage have registered in Deschambault, Que., as contractors.

A grist mill and elevator will be erected in Canora at a cost of $30,000.

Fort Erie is asking tenders for the installation of an electric lighting system.

The Berlin (Ont.) Hotel Co. has been incorporated, with a capital of $250,000.

A shipbuilding company is to be formed at Kingston, with a capital of $100,000.

The Alberta Pacific Elevator Co., of Calgary, will erect an elevator in Bawlf, Alta.

A new factory is being built for G. A. Eastman, trunk manufacturer, Winnipeg.

A bicycle and automobile factory will be erected by McKinnon Bros., in Port Arthur.

A large brewery is to be built in Medicine Hat by E. F. Sterner, of Milwaukee.

Moose Jaw may spend $160,000 on improvements to the electric light plant this year.

The Washburn Crosby Co., of Minneapolis, will erect an 8,000-barrel mill at Keewatin.

The Petrolea Gas Co. and the Electric Light, Heat and Power Co., have amalgamated.

A new boiler shop has been erected on Bridge St., Ottawa, by the Capital Boiler Works.

The Dominion Smelters Co. will build a customs smelter at Parry Sound, to cost $1,500,000.

Lendon Bros, Leamington, are extending their premises by the erection of a new warehouse.

The Niagara Falls Machine and Foundry Co. has been awarded the contract for hydrants for Hamilton, at $40.50 per hydrant.

A new boiler manufactory has been started in temporary premises on Humber Bay, Toronto.

The core-room of the malleable iron works in Brantford, was damaged by fire on March 4.

The Muirhead Milling Co. will erect a 200-barrel flour mill at Port Arthur to cost $100,000.

Dresden, Ont., defeated a by-law to aid a machinery manufacturing industry on March 18.

The Crescent Machine Co. has registered in Montreal, with Charles M. Gardiner as president.

McCamus, McKelvie & Dowser, New Liskeard, will open a sash and door factory at Englehart.

The Wortman & Ward Company, London, are adding largely to their premises and plant.

G. R. Charleson, Minnedosa, has closed his machine shop, to build a new and more capacious one.

Tenders for the erection of a soap factory in Regina for J. M. Young & Co., have been called for.

The roundhouse of the Canadian Pacific Railway Co., Havelock, Ont., will be doubled in capacity.

An apartment block to contain one hundrex suites is to be erected at a cost of $300,000 in Winnipeg.

The Cline Furniture Co., Stratford, has under consideration extensive additions to its factory.

Christie, Brown & Co., Toronto, will extend their premises by a six-storey and basement factory.

Wetaskiwin ratepayers have voted to spend $140,000 for waterworks and $30,000 for electric lighting.

The Ellison Milling & Elevator Co. is calling for tenders for a $75,000 mill and elevator for Calgary.

W. H. Stirling's brass foundry at 28 Water Street, St. John, N.B., was damaged by fire on March 20.

A $15,000 or $20,000 apartment house is to be erected on Queen street east by McCarthy & Co., Toronto.

Two sawmills, with a total capacity of 160,000 feet of lumber, are being built on False Creek, Vancouver.

The Ottawa Car Co. are looking for a suitable site at Hintonburg for the location of a new factory.

The Canadian Westinghouse Co., Hamilton, will build a large extension to its present plant this year.

The Dominion Car & Foundry Co., Limited, has registered in Montreal, with W. V. Kelly president.

The General Brass Works, Limited, Toronto, are building a factory and foundry on Sterling Avenue.

D. Gavin, Vancouver, has been granted a permit for the erection of a $16,000 brick warehouse in that city.

Welland has carried a by-law granting a site and certain concessions to the Billings & Spencer Forge Co.

The Grand Trunk has placed an order for 3,000 tons of steel for new shops with the American Bridge Co.

The Canadian Flax Cordage Co. have asked St. Marys for a loan of $5,000 to extend their plant in that town.

Preparations for an enlargement to the works of the Goold, Shapley, Muir Co., Brantford, are under way.

Alliston has carried a by-law granting a bonus of $5,000 to the Merner Manufacturing Co., of Waterloo.

The contractors have been notified to begin work on the new buildings for the Gibson Manufacturing Co., Guelph.

The Moose Jaw Electric Co. has lately commenced operations in the supply and contract business in that town.

Chas. Rogers & Sons, Toronto, furniture and mantel manufacturers, are building an addition to their factory.

A permit has been granted to the Ottawa Wine Vault Co. for the erection of a stone building at a cost of $28,000.

D. Whitney will have a large brick and stone business block erected at Lethbridge, costing from $10,000 to $15,000.

The Canadian Niagara Power Co. has been granted permission to increase its bonds from $8,000,000 to $10,000,000.

Nerlich & Co., Toronto, have been granted a permit for a two-storey addition to their warehouse, to cost $35,000.

A permit has been granted to the A. J. Burton Saw Co., Vancouver, for the erection of a $3,300 addition to its plant.

The addition which is being built by the McGregor-Gourlay Co., Galt, is expected to be ready for occupation in June.

A large extension will be made to the car works planing mill of the Rhodes, Curry & Co., Amherst, N.S., in the spring.

The Montreal & Lake Superior SS. Co. has decided to order another boat of the type of the Waheondah and Neepawah.

The International Portland Cement Co. have decided to duplicate their plant at Hull. The new capacity will be 4,500 barrels.

Gordon, Mackay & Co., are erecting a five-storey clothing factory at the corner of Queen and Crawford Sts., Toronto.

The Silliker Car Company has bought three acres of land in Halifax, and the building of shops is expected to begin shortly.

The Polson Iron Works Co., Toronto, have been given the contract for a new

hydraulic dredge for the city to cost $72,000.

James Coristine & Co., Limited, will erect a seven-storey office building on Lemoine St., Montreal, at a cost of $82,000.

The Robertson Machinery Co., St. Catharines, will erect a large warehouse and go into the wholesale hardware business.

A soil pipe manufactory is about to locate in Galt. The McDougall Co.'s moulding shop, King St., is the probable site.

Robert Hamilton & Co., Vancouver, have ordered two hand-power traveling cranes from the Smart-Turner Machine Co., Hamilton.

The Canadian Pacific Railway will build a new depot at Calgary during the coming season. The cost is estimated at $200,000.

The Dunbar Machinery Manufacturing Co., of Woodstock, N.B., is considering the advisability of moving its plant to Gibson.

Smith Bros. & Wilson have been awarded the contract for the erection of Ald. T. Wilkinson's new warehouse in Regina to cost $12,000.

The Polson Iron Works have been awarded the contract for the construction of a $12,000 hydraulic pump for the city of Toronto.

A $30,000 bridge shop, 400 x 70 feet, will be erected on Sorauren Avenue, Toronto, by the Dominion Bridge Company, of Montreal.

Application has been made for a winding up order in connection with the York Mfg. Co., Toronto, makers of laundry machinery.

The Dominion Power and Transmission Co. will erect car shops in Hamilton to build all the cars needed for its many different lines.

The Pope Manufacturing Co., of Wisconsin, may establish a plant in West Selkirk, Man., for the manufacture of gasoline launches, etc.

Moose Jaw is considering an expenditure of $163,000 for additions and improvements to the municipal electric light and power plant.

The Grand Trunk Ry. are making big extensions to the Point St. Charles works, with a view to manufacturing their own rolling stock.

The Canadian Inspection Co., Limited, inspecting and testing engineers have found it necessary to open a branch office in Toronto.

The Canada Foundry Co. is asking tenders for the plumbing work connected with the new machine shop now being completed by the firm.

The T. Eaton Co., Toronto, have been granted a permit for the erection of an eight-storey building, at the corner of Yonge and Albert streets.

The Northern Turpentine Co. has been incorporated with a capital of $250,000 for the establishment of a large turpentine plant at Killaloe, Ont.

The John Inglis Co., Toronto, have been awarded the contract for a million gallon pumping engine for the pumping station on Toronto Island.

The Public Works Committee of Calgary have reported in favor of the installation of a municipal street railway system at a cost of $250,000.

Cayuga (Ont.) is in communication with a company, capitalized at $500,000, which is looking for a favorable site for the establishment of a smelter.

A cordage company will be established at Valleyfield, Que., arrangements having been made with the Montreal Cotton Co. for supply of electric power.

The A. Darling Co., Toronto, has secured a permit to erect a nine-storey warehouse at the corner of Spadina Ave. and Adelaide St., to cost $100,000.

The smelting capacity of the Granby Consolidated at Phoenix will be increased one-third, thus making provision for a daily capacity of 4,200 tons.

The King Radiator Co., Toronto, who secured a site for their radiator works in Ashbridge Bay, Toronto, will commence building operations at once.

W. E. Bonner, of the Non-resident Owners' Realty Co., Winnipeg, will erect a new hotel at Strathcona this summer, costing between $10,000 and $15,000.

The town of St. Andrews, N. B., has asked permission of the legislature to borrow $40,000 for an electric street lighting system, sewers, wharves, etc.

W. H. Banfield & Sons, Toronto, have added a 28-inch Smith & Mills shaper to their machine shop. They state that they are rushed to death with orders.

In future the factory of the Peterborough Pre-Payment Meter Co., will be operated practically as a branch of the Allis-Chalmers-Bullock Co., of Montreal.

The Consolidated Electric Co., Toronto, has installed seven "King Edward" motors in the new building of the Booth Copper Co., on Sumach Street, Toronto.

The Smart-Turner Machine Co. has purchased the Zealand's wharf property in Hamilton, and will erect a factory there for the manufacture of motor boats.

Work was commenced on March 8 on the addition to the Galt Malleable Iron Works. When this is completed the capacity of the works will be about doubled.

The largest private carshops in Canada are expected to be located in Medicine Hat. It is said that building operations will be commenced early this spring.

The T., H. & B. Ry. will replace the workshops, recently destroyed by fire, at Hamilton, with a brick building to cost $10,000. George E. Mills has the contract.

The Scientific Brick Co., Toronto, is applying for a winding-up order in the affairs of the Modern Brick and Stone Co. The latter Co. was capitalized at $200,000.

Shaw Bros., Dauphin, Man., have recently ordered from the Robb Engineering Co. one 100 h.p. Robb-Armstrong automatic engine for their plant at Dauphin.

An order has been placed with the Carnegie Steel Company, of Pittsburg, for more than 800 tons of steel rails to enter into the construction of an electric street railway system in Edmonton.

The machinists employed by the Grand Trunk Railway, have asked the company for an all round increase, and in the event of a refusal a strike is anticipated.

The Rat Portage Lumber Co. will install a $100,000 plant in the $250,000 mill at Harrison, B.C., purchased three years ago and cutting will commence in the spring.

The Canada Foundry Co., Toronto, have since January 1, delivered two ten wheel locomotives and one switching locomotive to the Canadian Northern Railway Co.

The Vancouver Board of Trade has passed a resolution calling on the Dominion Government to build a 250,000-bushel elevator in that city to store Alberta wheat.

The ratepayers of Wetaskiwin unanimously passed debenture by-laws to raise $150,000 for the installation of waterworks and $30,000 for electric light extension.

The Daisy Boiler and Radiator Mfg. Co., of Montreal, has made application to the Board of Control of Toronto, for a suitable site on which to build a branch factory.

Chas. Rogers & Sons have been granted a permit to erect a three-storey factory adjacent to their present premises at the corner of Defoe and Tecumseh streets, Toronto.

The Alberta Brick Co. has been formed at Medicine Hat, with a capital of $20,000. The president of the company is W. C. Harris, with W. A. Wyatt as secretary-treasurer.

The London Brass Works Co., having found their business to have outgrown their premises, on Carling St., have purchased a site in the East End for a new building.

The Iron Moulders' and Core-Makers' Union of Toronto at a meeting on March 10 decided to ask for an increase of 25 cents per day, making their minimum wage $3 a day.

The Northwestern Brass Co., Winnipeg, representing an investment of $10,000, will be turning out its products in less than two months, and will employ from 60 to 75 hands.

The Goldie & McCulloch Co. has definitely decided to erect a new safe works in Galt. The company also purchased some acres of land on which to build dwellings for employes.

A $100,000 company, to be known as the Amherst Red Stone Quarry Co., will develop the red stone quarry near Amherst, N.S. A sawing plant and steam shovel will be installed.

A factory for the manufacture of automobiles and bicycles will be erected at Port Arthur. McKinnon Bros. have secured a site and building operations will commence at once.

The Galt, Preston & Hespeler and the Preston & Berlin Electric Railway Companies will spend $110,000 in double tracking the line from Preston to Galt, building new cars, and installing more power producing machinery.

The Hamilton Steel and Iron Co., Hamilton, Ont., have taken out a permit to build a $300,000 addition to its blast furnace and a $50,000 addition to its open hearth steel plant.

The Sydney Foundry & Machine Works may add a steel plant for the manufacture of all kinds of castings, and the company will probably be formed into a joint stock concern.

The new Bessemer converter being installed at the Dominion Iron and steel works at Sydney, is nearing completion. This converter will increase the output by 50,000 or 60,000 tons a month.

The National Spring and Wire Co., of the State of Michigan, has secured the right to do business in Ontario. A. W. Marquis, of St. Catharines, has been appointed as their attorney for Ontario.

Representatives of the Crandall Cutlery Co. of Pennsylvania, have been making investigations in connection with the establishment of a Canadian branch Dundas, Ont., is under consideration.

The Montreal Street Railway Co. will make large extensions to its lines, comprising the Montreal Park and Island Railway and the Montreal Terminal Railway, during the coming summer.

The Whitman & Barnes Co. have decided to retain the St. Catharines branch of the firm, and erect new buildings. The city council will see that better railway facilities are provided.

North Vancouver is likely to have a large engineering works. A company is negotiating with the North Vancouver Ferry and Power Co. for land suitable for the establishment of such a plant.

Hespeler has granted a loan of $15,000 to the Hespeler Hoisting Machinery Co. It is thought that the Parkin Elevator Co., of Hamilton, may join the Hespeler company and move to that town.

The Ontario Interurban Railway Co. will apply for incorporation shortly, with the object of building an electric line between Belleville and Picton, with branches at Weller's Bay and Sand Banks.

Definite arrangements having been made by the Canada Stove Co., Ottawa, for their amalgamation with the Canada Radiator Co., Lachine, a large new factory will be built in Ottawa this spring.

The New Brunswick legislature is in communication with the Mackenzie & Mann syndicate regarding a proposition by the latter to construct a railway down the valley of the St. John River to Westfield.

The J. W. Woods Mfg. Co.'s plant, Ottawa, will be moved to Hull, Que. Mr. Woods has granted a $40,000 contract with Holbrook and Sutherland, who will undertake the erection of the new factory.

The T. & No. O. Railway Commission let the contract to the Montreal Locomotive Works for six new locomotives. The aggregate cost will be about $125,000. Delivery must be made by the end of October.

Fire broke out in the machine shop of the McGregor-Banwell Fence Co., Walkerville, on March 16. It spread to the main building, and caused a loss of between seventy and eighty thousand dollars.

The Standard Sand & Machine Co., Cleveland, O., is building a complete plant for handling sand for continuous moulding. This is to be installed in the plant of the Standard Ideal Co., Port Hope, Canada.

The Somerville Co., Limited, will erect a $40,000 building on the property leased by them in Ashbridge's Marsh, Toronto, if arrangements can be made with the harbor commissioners for the necessary filling-in.

The Ontario Hydro-Electric Commission has received two requests for estimates of the cost of electrical energy. One is from Collingwood for prices on 3,000 h.p. and the other from Uxbridge for prices on 600 h.p.

The Canadian White Co., Montreal, have received a contract from the Fordwick Co., New York, for the construction at Kingston of a million-dollar cement plant, with an initial capacity of 2,500 barrels per day.

The city of Victoria is about to call for tenders for the installation of two large pumps for the city waterworks system at Elk Lake. They will be purchased on the recommendation of Water Commissioner Raymur.

A group of capitalists have made an offer to the council of Fort William to establish a million dollar shipbuilding plant, which will employ between 350 and 500 men, if the city gives them proper encouragement.

Building will be begun in connection with the enlargement of the Grand Trunk shops in Stratford as soon as the weather will permit. The general plan will be along the lines of the shops at Battle Creek, Mich.

The Canadian Boomer & Boschert Press Co., Limited, Montreal, are furnishing a large hydraulic press to the Peterboro works of the Canadian General Electric Co., for use in the manufacture of transformers.

It is understood that a Canadian branch of the Berlin Manufacturing Co. of Beloit, Wis., manufacturers of woodworking machinery, has been organized, and that Hamilton has been chosen as the site for a large plant.

The Pittsburgh Reduction Company, which enjoys a monopoly of the aluminum industry in America, is contemplating the erection of a large plant near Mille Roches on the St. Lawrence, at a cost of several million dollars.

The "Allied Industries," believed to consist of the Canadian Fire Engine Co., of London, Ont., and two other large firms, will establish a plant in St. Louis (Montreal), if arrangements now in progress turn out as expected.

The town of Prince Albert, Sask., has accepted tenders amounting to $26,237 for additions to the electric light plant, the successful tenderers being Goldie & McCulloch, the Allis, Chalmers, Bullock Co., and the Canada Foundry Co.

The property of the Jackson Wagon Works has been acquired for the Galt factory of the Canadian Brass Manufacturing Co. Mr. Le Favor, the representative of the company, says the work will be rushed to completion.

The Scott Machine Co., one of the latest additions to London's manufacturing concerns, is rapidly building up a large business, and there is every indication that before long they will have to look for more extensive quarters.

F. Oliver, manager of the Perrin Plow Co.; B. Knapp, Morrisburg, Ont., and R. S. Harder, Aurora, Ont., have purchased the plant of the Rideau Electric Co., Smith's Falls, Ont., and will go in for stove manufacturing.

It is stated that the Great Lake Engineering Works, Detroit, Mich., and the Toledo Shipbuilding Co., Toledo, Ohio, will consolidate and that they will erect a large shipyard plant in Canada at some point opposite Detroit.

Plans have been filed for the extension of the Niagara, St. Catharines and Toronto Railway from Fort Erie to Lundy's Lane. Plans have also been filed for an electric line from Niagara-on-the-Lake to St. David's and St. Catharines.

It is expected in Thorold, Ont., that the North America Refining & Smelting Co. will locate their smelter in Thorold Township, a short distance from the town. The township will vote on a by-law to exempt the concern from taxes.

The amalgamated business of the Canada Screw Co. and the Ontario Tack Co. may be removed from Hamilton to Welland. Negotiations are on for the change but the company state that no definite decision has yet been arrived at.

The Dominion Government will enlarge its accommodation at Ottawa by the erection of two buildings on the eastern side of the canal. One building will have a floor area of 300,000 square feet, and cost $2,000,000; the other an area of 100,000 square feet, costing $750,000.

A $1,000,000 cement plant to produce 5,000 barrels per day, and to be running in less than a year is being promoted by J. L. Howard, president of the Western Fuel Co., Nanaimo and San Francisco. The site for the proposed works is at Kendall.

The Tidman Silver and Aluminum Co., Toronto, has been incorporated, with a capital of $40,000, to manufacture and deal in aluminum ware, silverware and metal novelties. Provisional directors of the company are: F. A. Lewis, E. Gillis and M. W. Mayhr.

Rhodes, Curry & Co., of Amherst, have received an order to build forty three-ton store cars for the Dominion Iron and Steel Company. The Wallace Stone Company have also placed an order with the same firm for eleven cars of the same type.

The Eastern Townships Bank have filed plans for a 10-storey fireproof building to be erected at the corner of St. James and McGill Sts., Montreal, at a cost of $300,000. The Peter Lyall Co. have the contract, Cox and Amos being the architects.

The capital of the International Gas Appliance Co. has been increased from $49,000 to $200,000, and the name of the company has been changed to "International Lighting Appliances, Limit-

ed." The number of directors has also been increased to five.

Twelve prominent men of North Bay, Haileybury, and other New Ontario towns are applying for a charter, under the name of the Silver Belt Electric Railway Co., to build 35 miles of lines in the districts mentioned. The proposed capital is $1,500,000.

The Kitchener Lumber Co., of Kitchener, B.C., have recently ordered a large mill from the Robb Engineering Co., consisting of one 100 h.p. Robb-Armstrong slide valve engine, one 100 h.p. Robb-Mumford-Brady portable boiler, rotary mill, gang edger, etc.

A bill to give the Dominion Iron and Steel Company the right to form subsidiary companies to carry on any trade or business within the limits of the company, and to guarantee the stock of these companies, has been introduced in the Nova Scotia Legislature.

R. Bigley, manufacturer of stoves and furnaces, and Toronto agent for the Buck Stove Co., Brantford, has purchased land on the Weston Road, near Toronto Junction, and purposes building a factory to cost $7,000, employing at first 50 men, afterwards 120 men.

The Niagara Falls Machine & Foundry Co. has abandoned its plan to enlarge its present works, and instead will build an entirely new plant on a new site. The new works will be about twice as large as the present one and will be modern in every respect.

Mr. Maury, an expert engineer of Peoria, Ill., who was employed by the water commissioners of London, Ont., to investigate the matter of an adequate water supply, has recommended the combined river and spring water plan. This plan would cost $429,000.

The Colonial Engineering Co. has been incorporated to carry on the business of electrical, mechanical and civil engineers and contractors, and to manufacture and deal in machinery connected with such work. The capital of the company is $125,000, and the head office will be in Montreal.

Morlock Bros., furniture manufacturers, Guelph, Ont., will double the capacity of their factory this year. One new four-storey building, 100 x 65 feet, will be erected, and two stories, 100 x 45 feet, will be added to another. The total cost of the buildings will be about $18,000.

The Wolverine Brass Works, of Grand Rapids, have decided to locate a branch in Toronto. The manager, who was in Toronto last month, says the duty levied on United States goods makes it impossible to export at a profit into Canada, and hence the decision to open a branch here.

The Hamilton and Fort William Nav. Co. have placed an order with the Canadian Shipbuilding Co. for an 8,000-tons steamer, for the upper lake coal and ore trade. The vessel will be 460 feet long, 53 feet beam, and a 29 feet draught. Quadruple expansion engines and Scotch boilers will be installed.

The blast furnace plant of the Atikokan Iron Co., Port Arthur, Ont., will shortly be put in operation. The structural work which has been going on for the past two years has been completed, and the furnace is now ready to erect. The plant will turn out about 150 tons of pig iron in 24 hours.

A 70 x 40 foot addition has just been completed by the Canadian Corundum Wheel Co., of Hamilton, containing a new $16,000 list kiln of 12 ft. inside capacity. This increase in equipment is necessary in order to meet continued growth of business. It is the third enlargement of the plant in three years.

The enlargement to the lighting plant of the town of Barrie, commenced last May, has been completed, and the new equipment is now running in service. Mr. K. L. Aitken, the consulting engineer, made an extensive series of tests during the week of March 11th, and all the apparatus has since been accepted.

H. Krug & Co. are building a large addition to their chair factory in Berlin, Ont. When completed, the new building will be 150 x 85 feet, four stories of brick mill construction. About 100 feet of the addition is now built, the other 50 feet will require the tearing down of a part of the old factory.

The Imperial Steel & Wire Company offer to construct at Hamilton a wire drawing mill with a capacity of one hundred tons of wire daily, at an approximate cost of $200,000, if the city will guarantee the principal and interest of the first $100,000 and grant a site of ten acres of land with a river frontage of 150 feet.

The Borden-Canadian Co. have recently opened an office at 166 Adelaide Street West, Toronto, and will soon put on the Canadian market their new Rapid Worker hand stock for threading pipe. Several new features are embraced in this stock, and it is thought that a ready sale will be found for it in both this country and Europe.

The contract for grading the new railway between St. Marys and Embro has been let to John E. Webb, Toronto. The Dominion Steel Co. will provide the rails. One large bridge will be necessary in order to cross the Thames at St. Marys. The line, which is 15 miles in length, will be operated by the Canadian Pacific Railway.

C. F. May, of Toronto, representing a $1,500,000 company, is seeking terms from the city of Kingston for the establishment of a plant for the smelting and refining of Cobalt ores. W. W. Hadley and John Grey, of Guelph, are also mentioned in connection with a similar undertaking, having secured options on zinc ore lands in Frontenac.

The International Veneer and Lumber Co., of Philadelphia, will establish a factory at Arnprior if given by the town a free site of two acres, a subvention of $2,000, exemption from taxation for a period of ten years, free water during a period of ten years for a 250 horse-power boiler, and assistance from the council in placing $8,000 stock.

The Canadian Fairbanks Co., Montreal, have ordered from the Robb Engineering Co., two 45 h.p. and one 65 h.p. portable boilers. These boilers are for use in British Columbia, and are the second lot ordered by this company within the last two months. They are known as the Robb-Mumford-Brady portable boilers and are becoming very popular in British Columbia for sawmill work.

The annual report of the Canadian Westinghouse Co., Ltd., shows for the year ended Dec. 31, net earnings of $346,961, increase $126,416; dividends, $179,550, increase $30,450; balance $167,411, increase $95,966; reserve for depreciation, $120,000, leaving a surplus of $47,411; previous surplus, $232,041; balance carried forward, Jan. 1, 1907, $279,452.

The Ontario Government is installing a Duplex brass-fitted pump at Massey, Ont., which is being supplied by the Smart-Turner Machine Co., of Hamilton. The Robb Engineering Works, Amherst, N.S.; the Doty Engine Works, Goderich, and the Miramichi Machine and Foundry Co. are among other purchasers of Duplex pumps during the past few weeks.

The Canada Mfg. Co. are spending between $7,000 and $8,000 on enlargements to their factory at Berlin, Ont. An old, unused wing of the present factory is being reconstructed and enlarged, and will be equipped for the manufacture of high class mahogany furniture. A new dry kiln, tin covered, on concrete foundation, with a capacity of about 20,000 feet, will be added this spring.

An important transfer of property took place last week, when Frank Oliver manager of the Perrin Plow Co.; B. Knapp, Morrisburg, and R. S. Harder, Aurora, purchased the plant of the Rideau foundry, Smith's Falls, and all stock on hand. The new company will commence operations at once in the manufacture of stoves. The stock on hand amounts to $10,000, including about 500 completed stoves.

The Intercolonial Railway Company have issued a new edition of their map of Ontario, Quebec and the Maritime Provinces. The map is tastefully colored, clearly printed, and contains along the margin views of interesting scenes on the route of the famous Maritime Express. They will be pleased to send one free of charge to any reader of this paper upon request to Mr. J. J. McConiff, City Passenger Agent, Montreal.

One of the new factories lately contributed to Canada by Uncle Sam is the Anthony Fence Company, of Walkerville, Ont. This new concern is an outgrowth of a similar business established at Tecumseh, Michigan, and although one of the youngest of American fence companies, having been under way only about three years, it now ranks as one of the most important of its kind. The Walkerville business is financed largely by Canadians.

To meet the growth of the city the Vancouver Gas Co. is planning large increase of its plant. The present location of the producing plant is so restricted that a new site has to be secured for the proposed larger plant. The company now has an expert on the ground, L. L. Merrifield, M. Inst.M.E., C.G.S., of Toronto, and this gentleman is to go over the whole situation and make recommendations for the enlargement of the present capacity of the gas plant.

The new Gantry crane building for the Collingwood Shipbuilding Co. is now well under way. The crane has a travel north and south of 560 feet and

cast and west 122 feet. Its hoist is 60 feet. The main hoist motor is of 40 h.p. designed to lift 10 tons from 50 to 60 feet per minute. The bridge travel motor is of 75 h.p. and is capable of driving the entire bridge at 500 feet per minute, while the cross trolley motor is of 10 h.p. for a speed of 250 feet per minute. There is also an auxiliary hoist with a 5 h.p. motor, which will be used for quick lifts below 2 tons.

After experimenting with steel flat cars and steel passenger, postal, baggage and Pullman cars, railway officials are devoting their attention to steel box cars. It is claimed that these would be at least 12 per cent. lighter than the standard box car, and this and other advantages will probably induce some of the leading railways to place large orders in the near future. The new steel box car built by the Union Pacific, which is the first of the kind, is being watched with interest by representatives of various roads.

The firm name of the machine business so successfully carried on during the past two years by Mervin Armstrong at 166 Adelaide Street West, Toronto, has been changed to Armstrong & Hatch, Arthur E. Hatch having entered into partnership with Mr. Armstrong. Mr. Hatch, who has been on the road for the past six years, representing the Smart Bag Co., Ltd., resigned his position some days ago to take charge of the office in connection with his new work, thus allowing Mr. Armstrong to devote his whole time and attention to the practical end of the business. The capacity of the plant has recently been largely increased by the installation of new and larger machinery, and still other equipment is coming forward. For some time past the shop has been running night and day.

Convention of Foundrymen's Association.

The annual convention of the American Foundrymen's Association and the exhibits of the Foundry Supply Association, which are run in conjunction with the convention, will be held in Philadelphia on May 20th-24th. The exhibits of the Supply Association will include all classes of foundry equipment and supplies; and one of the most interesting exhibits will be that of oil melting furnaces, and also molding machines.

In the past Canadian foundrymen have taken considerable interest in these conventions; and probably this year there will be the usual representation at the convention from Canada.

There is some thought of holding the next annual convention in Toronto, if possible; but owing to the tariff regulations some of the American supply houses are of the opinion that it would be practically impossible to have the exhibits in Toronto. In consequence it has been considered that the exhibit of the Supply Association could be made in Niagara Falls, N.Y., while the convention proper of the Foundrymen's Association could be held in Toronto. Then it would be advisable to hold some of the sessions in Niagara Falls and some in Toronto; and as the distance between the two places is short, this would be feasible.

Companies Incorporated

The Massive Corundum Co., of Niagara Falls, has received a charter.

The National Clothing Co. is incorporated, with a capital of $20,000. The head office will be in Montreal.

The German Canadian Smelting and Refining Co. has been incorporated under provincial charter with a capital of $1,000,000.

The Dominion Quarry Company has been incorporated, with a capital of $20,000, the head office to be in Montreal. The company will carry on a general quarry and contracting business.

The Kaine & Bird Transportation Co. has been incorporated, with a capital of $100,000, and head office in Quebec, to build and operate vessels and carry on a general transportation business.

The King Electrical Works have been incorporated, with a capital of $30,000, and head office in Montreal, to deal in brass, copper and other metals, and to manufacture electrical machinery and fixtures.

The McFarlane and Douglas Co. have been incorporated under provincial charter, with a capital of $100,000, to carry on the business of founders and machinists and the manufacture of builders' supplies.

The Toronto Automobile Co., Toronto, has been incorporated, with a capital of $10,000, to manufacture automobiles, motor cars, bicycles, cycles, etc. The provisional directors include J. S. Tomenson, C. H. McArthur, and B. Browne, Toronto.

The Tidman Silver & Aluminum Works, Toronto, have been incorporated, with a capital of $10,000, to manufacture aluminum ware, silverware, metals, etc. The provisional directors include H. D. McCormick, F. A. Lewis and D. A. Rose, Toronto.

The Descronto Furniture Co., Deseronto, Ont., has been incorporated, with a capital of $65,000, to manufacture lumber, timber, furniture, etc. The provisional directors include J. Dalton, Deseronto, Ont.; W. S. Love, and I. F. Love, Napanee, Ont.

Canada West Manufacturers, Limited, Winnipeg, Man., have been incorporated, with a capital of $50,000, to manufacture machinery, engines, implements, vehicles, etc. The provisional directors include G. Bingham, J. A. Cowan, and W. J. Cummings, Winnipeg, Man.

The Petrolea Bridge Co., Petrolea, Ont., has been incorporated, with a capital of $40,000, to manufacture structural steel, bridge working machinery, concrete, cement, etc. The provisional directors include J, Fraser, T. Johnstone and I. Greenizen, Petrolea, Ont.

W. C. McIntyre, H. M. Marler, A. Racine, and W. T. Whitehead, of Montreal, with C. W. Trenholme, Westmount, have been incorporated under the name of the Mount Royal Spinning Company. The capital is placed at $3,000,000, and the head office will be in Montreal.

A. C. McMaster, G. R. Geary, F. D. Byers and others, have been incorporated under the name of Electrical Specialties, Limited, to carry on the business of electricians, mechanical engineers and manufacturers. The capital is $300,000, and the head office will be in Toronto.

The Carter-Hall-Aldinger Co., Winnipeg, Man., has been incorporated, with a capital of $50,000, to manufacture machinery, tools, contractors' and builders' supplies, etc. The provisional directors include W. H. Carter, P. C. Locke, Winnipeg, Man., and A. H. Aldinger, Chicago, Ill.

The business of T. Pringle & Son, hydraulic engineers, is to be taken over by a company newly incorporated under the name of T. Pringle & Son, Limited, and capitalized at $250,000. The head office will be in Montreal. A general engineering and construction business will be carried on.

Philip Lahee, Arthur Morin and others have been incorporated under the name of the Dominion Electric Manufacturing Co., to carry on the business of electrical and mechanical engineers and manufacturers. The capital is fixed at $20,000, and the head office of the company will be in Montreal.

The International Steel Company of Canada has been given a charter to carry on a general business as engineers, machinists, and manufacturers of machinery of all kinds. The new company will take over the business at present carried on by the St. Lawrence Supply Co., Montreal, and the head office will be in that city. The capital is $500,000.

The Canadian Fire Extinguisher Co., Toronto, has been incorporated, with a capital of $40,000, to manufacture fire preventative appliances, electric light and gas fittings, machinery, motors, dynamos, switch boards, engines, pumps, brass, lead, valves, pipes, faucets, etc. The provisional directors include F. W. C. Dickson, J. Murphy and W. Lauder, Toronto.

A charter has been granted to W. D. Long, G. H. Bisby and G. F. Glassco, merchants; Edward Gurry, mechanic; F. W. Gates, insurance agent, and P. D. Crerar, barrister, all of Hamilton, who will purchase the patent issued to Edward Gurry for an improvement in machines for moulding pig iron. The firm name will be Gurry Patents, Limited, and the capital is $40,000.

A charter has been granted to H. B. Muir, P. L. Shaw, G. McL. Baynes and others, who will engage in the printing and publishing business, under the name of Contractors' Reports, Limited, with the main object of conducting a system of reports for the use of contractors, builders, architects and others. The head office will be in Montreal, and the capital of the company is $20,000.

The Smart Bag Co. has been incorporated, with $2,500,000 capital, to manufacture jute, cotton, paper, and other bags, to deal in burlaps, ropes and twines, and articles of a similar nature, as well as to construct and maintain the various power plants necessary for such a business. The Smart Bag Co., Limited, and the Canadian Bag Co., Limited, are to be absorbed in the new organization. The head office will be in Montreal.

PIG IRON FOR ENGLISH TRADE.

It is stated by J. B. Jackson, in the Trade & Commerce Reports, that the grades of Canadian pig iron which are arriving at Liverpool at present are of an exceptionally high order; and that English manufacturers always give Canadian pig iron the preference over the common warrant iron produced at Middlesborough. He also states that the firms in Liverpool are almost unanimous in the opinion that if Canadian exporters would make a closer study of the requirements of the British market, and produce a more uniform graded metal, their trade would increase ten-fold, and that they would get 50 per cent. more for it than they do at present.

MAKING SOLDERING FLUX.

Chloride of zinc is very extensively used as a flux in soft soldering. It is an excellent one, too, and nothing has yet been found to take its place. It also has the advantage of cheapness. The action of chloride of zinc in soldering is based upon the fact that it dissolves the oxides of tin and lead upon the solder, and produces a clean surfaee for uniting with the metal to be soldered.

The mistake that is frequently made in making soldering flux is to add water. The stronger the flux can be made, and still remain in the liquid condition, the better it will be. As it is the chloride of zinc that does the work, the presence of water is a detriment. The water also has the advantage of producing spattering. The action of a weak flux in cleaning the surface of the molten solder is far inferior to that of a strong solution. In order to produce the best results, the flux should be made by dissolving zinc in strong muriatic acid until it will take up no more.

The C.P.R. will erect a $20,000 station at Souris.

Condensed or "Want" Advertisements

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c a word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

SITUATIONS WANTED

ENGINEER AND DRAUGHTSMAN (25), salt and salt making machinery; small marine and mill; technical training; requires position. A. M. Mere Heath, Davenham, Cheshire. England.

ASSISTANT GENERAL MANAGER, McGill graduate, desires change of position. Twelve years' practical experience along engineering, machine, foundry and boiler shop lines. Best of references. Address Box 25, CANADIAN MACHINERY, Toronto. [3]

MACHINERY FOR SALE.

BELTING, RUBBER, CANVAS AND LEATHER, Hose, Packing, Blacksmith's and Mill Supplies at lowest prices. N. Smith, 138 York Street, Toronto. (2tf)

HAVING replaced our steam plant with electrical equipment at all of our mines and smelters, we now have for sale, air compressors, hoists, boilers equipped with underfeed stokers, pumps, Hereschoff furnaces, blowing engines, etc.; all of which can be inspected at Copper Cliff and shipped promptly; prices f.o.b. here; terms cash. The Canadian Copper Co., Copper Cliff, Ont.

EMERY STANDS—We have a quantity of these ready for delivery at exceptionally low figures.

GASOLINE ENGINES—Marine and stationary; 1½ to 20 h.p.

STEAM ENGINES—Second-hand Westinghouse; 20 h.p.

WASHERS—One thousand pounds 1 3-16 inches. Apply G. P. Wallington & Co., 11 Front street east, Toronto.

MACHINISTS WANTED

MACHINISTS — We want two or three first-class fitters. Apply Mr. Shand, Dodge Manufacturing Co., Toronto Junction.

MACHINISTS WANTED—We have increase our plant and desire floor and vise hands for day work, and lathe and planer hands for day and night; good wages and steady employment for A1 hands. Address or apply The John Bertram & Sons Co., Limited, Dundas, Ont.

WANTED—Two machinists, one moulder and boilermaker. John McCrae, Lindsay, Ont.

WANTED — Machinist — Must understand engine repairing. Bruce Agricultural Works, Teeswater.

BUSINESS CHANCE.

WANTED—First-class foundry and machine company to buy interest in high-class patented machine, weighing seven tons and to manufacture, sell and instal same; this is a good proposition and will stand investigation. Apply Box 26, CANADIAN MACHINERY, Toronto.

FOREMAN WANTED

FOREMAN—Machine shop making hoisting engines and dredges; must understand modern tools and high-speed steel; state experience, age and salary. M. Beatty & Sons, Limited, Welland, Ont.

MOULDERS WANTED

WANTED—First-class foundry man; to take entire charge on stove plate; must understand cupola, core making and willing to do everything in connection with the foundry; to the right man a steady position guaranteed. Niagara Falls Heating and Supply Co., Limited, Niagara Falls, Ont.

FLOOR MOULDERS WANTED — Wages 25c. to 30c. per hour. Apply to G. R. Craig, master mechanic, the Canadian Copper Co., Copper Cliff, Ont.

MACHINERY FOR EXPORT

On Admirality and War Office Lists.

IN STOCK. Ready for immediate delivery.
For Sale, on Hire, or on Purchase Hire.

MACHINERY

Reliable, Second-hand and New, including Portable and Semi-Portable Eogines, also Locomotive En ines, Engines and Boilers combined, alsu Horizontal, Vertical, Traction, Winding, Gas, and Oil Engines. Road Rollers, Pleuty of Cornish, Lancashire Loco-Type, Vertical and other Boilers, great variety. Saw Benches. Stone Breakers. Pulsometers and other Pumps. Steam winches. Cranes and other Lifting Machinery.

Inquiries and Orders receive careful and prompt attention.

Send for copy of "Phillips' Monthly Machinery Register," the best medium io the world for the purchase and sale of New and Second-hand Machinery of every description.

Note the Only Addresses:

PATENT RIGHTS FOR SALE

A U. S. firm manufacturing Graphoil Lubricators and Steam Cylinder Graphite Cups would like to correspond with reliable party with a view to introducing their goods on a commission basis in Canada, or would negotiate for the sale, in whole or in part, of Canadian patent rights. Address in first instance Box 51L, CANADIAN MACHINERY, Toronto.

Modern American Lathe Practice

A complete and practical work on the lathe— its orgin and development, its design, and various types as manufactured by different builders, as well as lathe attachments, lathe tools, rapid change gear mechanism, speeds and feeds, lathe testing, etc.

By Oscar E. Perrigo, M.E.

425 pages. Price, $2.50 Fully Illustrated

Diamo - Carbo Emery Wheel Dresser

ONCE USED ALWAYS USED

Those who have used Diamo-Carho once keep on using it. That is proof that it has unusual merit.

With Diamo Carbo, wheels can be formed into any desired shape without breaking the edges of the most delicate wheels. It will dress any kind of a wheel used for tool grinding. ***Superior to a black diamond*** and compared with it, costs but little.

Made in Three Lengths:—No. 1, 8 in. long, $3.00; No. 3, 10 in. long, $3.50; No. 5, 12 in. long, $4.00.

How about Diamo Carbo on ten days' trial, delivered F.O.B. your works?

SECURE THE BOOKLET ANYWAY.

URBANA, OHIO, U. S. A.

Motors and Launches

I have the following new complete launches about ready for delivery :

Power Skiff, 20' by 4', fine finish, equipped with 2 h.p. Erd Motor, $190.00.

Launch, 22', 4'6" beam, cedar planking, turtle bac deck, torpedo stern, equipped with 7½ h.p. 2 cylinder Erd motor, speed 10 miles an hour, $375.00.

Launch, 25' by 6' beam, cedar planking, quartered oak deck and coaming, equipped with 10 h.p. 2 cylinder Erd motor, speed 11 miles per hour, $550 00.

Erd motors from 2 h.p. to 30 h.p., from $65.00 to $600.00, also one 19 h.p. Buffalo 4 cylinder 4 cycle marine motor, as good as new, $250 00.

One 3½ h.p. Trebert, complete with reversing wheel, used only one season, $100.00.

One 6 h.p. Gillies stationary gasoline engine, cheap.

One 18' by 4'9" clinker built launch, equipped with 2½ h.p. Norwalk engine, launched Sept. 1906, speed 8 miles per hour, a bargain at $225.00.

Are You Taking Full Advantage of the Possibilities for Increasing Your Business ?

WHO PAYS FOR ADVERTISING?

Who pays the cost of advertising? At first sight this question looks easy. One is apt to say offhand that the advertiser pays it. But upon closer investigation it becomes apparent that an advertiser, who advertises properly, gets back all the money he spends in advertising, and a good deal more—else what would be the use of his advertising?

The purchaser doesn't pay it, because he gets the goods as cheaply from an advertising firm as he could from a non-advertising firm. In many cases he buys cheaper. Then who pays the cost of advertising?

The non-advertiser does! By the lack of enterprise in bringing his goods before the attention of the public he loses customers, who buy from advertising people. The profits which are lost by non-advertisers find their way into the coffers of those who do advertise.

More than a few men certainly are not. Because business is good, because they find a difficulty in filling orders, they have practically dropped out of the race for commercial supremacy. Every cent paid for advertising is so much paid on the only policy assuring lasting success. Cease advertising and lesser men will pass you on the road to success. The majority of men engaged in the manufacturing and machinery supply business have decided that advertising is good, and that

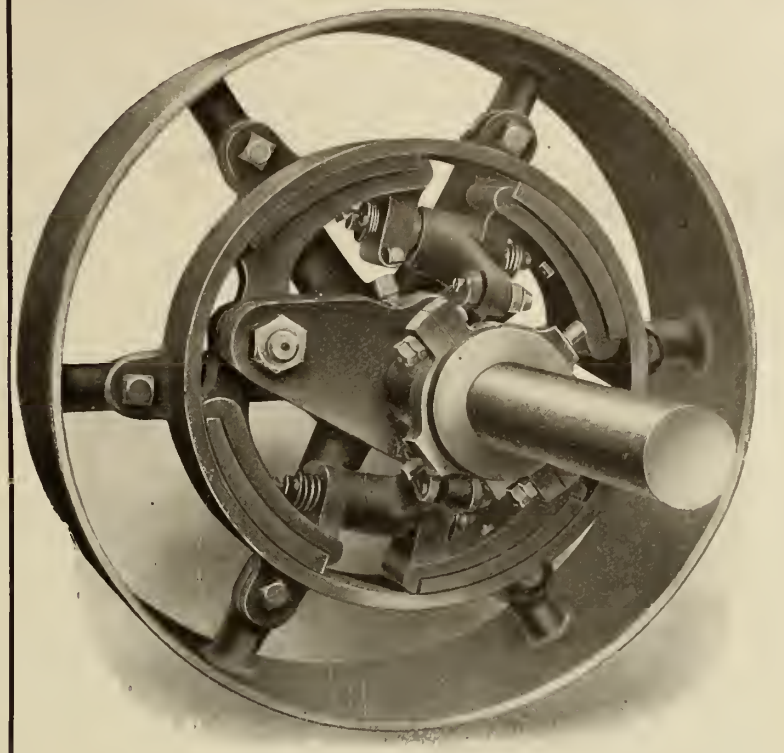
PATENT RIGHTS FOR SALE



We are prepared to sell the Canadian rights on our

FRICTION CLUTCH PULLEY

or will arrange with reliable firm to manufacture on a royalty.

Simplicity of construction and durability of working parts assure a ready market for this pulley.

Has been thoroughly tested and proven satisfactory. Is being used by the largest tannery in the United States.

We will be pleased to furnish any size pulley to responsible party on trial.

Write for further information NOW.

Technical Books

Dies

Their Construction and Use for the Modern Working of Sheet Metals.

By Joseph V. Woodsworth

Large 8vo. ; 384 pages ; 505 illustrations ; bound in cloth ; price, *$3.00*

The New Metal Worker Pattern Book

A Treatise on Pattern-Cutting as Applied to all Branches of Sheet Metal Work.

By Geo. W. Kittredge

Cloth bound ; price postpaid, *$5.00*

Modern Machine Shop Tools

Their Construction, Operation and Manipulation, including both Hand and Machine Tools.

By W. H. Vandervoort, M.E.

Large 8vo, ; 555 pages ; 673 illustrations ; bound in cloth ; price, *$4.00*

Modern Steam Engineering

By Gardner D. Hiscox

Price, *$3.00*

This is the most complete practical book issued for the Stationery Engineer. Just issued.

Compressed Air

Its Production, Uses and Appliances.

By Gardner D. Hiscox

Large 8vo. ; 820 pages ; 545 illustrations ; bound in cloth ; price, *$5.00*

Locomotive Catechism

By Robert Grimshaw

Illustrated by 222 engravings and 12 folding plates ; price, *$2.00*

Address Technical Book Dept. :

The MacLean Publishing Co., Limited

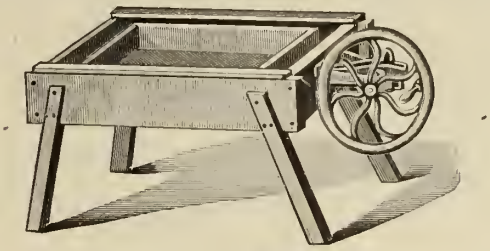
Montreal Toronto Winnipeg

Preferred to the best Plumbago and at 1-3 the cost.

Columbian Dry Sand and Loam Blacking at 1½c. per lb.

For Core sand Dry Sand and Loam Work is the Standard of America.

PORTABLE FOUNDRY SIFTING MACHINE



PRICE $25.00.

Miners of all grades Albany Molding Sand, also manufacturers of finest grades Stove Plate and Foundry Facings. Foundry Supplies of all kinds carried in stock.

High Grade Coiled Wire Springs for all purposes

The Cleveland Wire Spring Co.
Cleveland, Ohio.

The Globe Tilting Tumbling Barrel

admits of an adjustment in the degree of action on the tumbling parts—regulated by the side hand-wheel. Doesn't injure small stampings or castings, wet or dry. ¶ Tumbling parts can be seen, samples removed and replaced while running; and easily dumped into a small receptacle. ¶ Send for Booklet E.

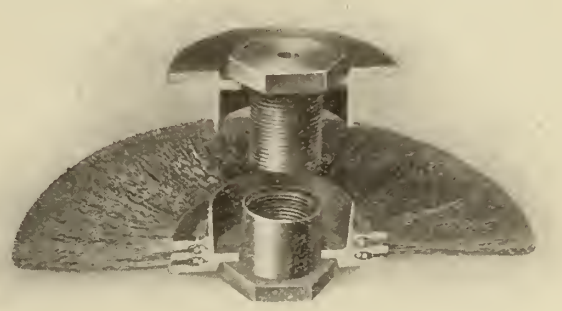
Economy Steel Wire Wheel Brush

Operated on an ordinary Emery Grinder

The use of an "Economy" means saving of time and money and a better finished product in almost every plant where metal articles are made.

One man with an Economy Wheel Brush will do more and better work than five men by other methods.



Patented June 5th, 1906

Sectional View, showing construction

The Hub is made of malleable iron and consists of a pair of face plates with connecting sleeve nut in the centre. The wire part, or brush proper, is made in sections, each section being held in position by a malleable dividing ring. When brush part is worn out, new sections can be substituted for the worn-out ones by simply unscrewing the sleeve nut.

THE OSBORN MANUFACTURING CO.
CLEVELAND, O.

Delays are Dangerous

They often read serious financial loss. You cannot afford to place your orders for

PIPE, CORE, STOVE PLATE and MACHINERY MOLDING SAND and LAKE ROOFING GRAVEL

with any old concern. Sometimes you want your sand orders filled mighty quick. Send for prices and samples. Quick deliveries a specialty.

MANUFACTURERS

FOUNDRY FACINGS SUPPLIES

The Hamilton Steel & Iron Co., Limited

Hamilton, - Canada

Manufacturers of

PIG IRON Grades: Foundry, Malleable and Basic

Iron and Steel Bars, Bands, Railway Spikes and Washers, Forgings, Etc.

Have under construction and will have in operation in July, second Blast Furnace, Stack 85 ft. by 22 ft. 6 in. This will increase present output of Pig Iron by 110,000 tons annually.

Ores are chiefly Canadian, from the Helen Mine, Michipicoten and other mines. This ore is brought down by Canadian boats.

Are also increasing Open Hearth Dept., which will double present tonnage of Steel Bars.

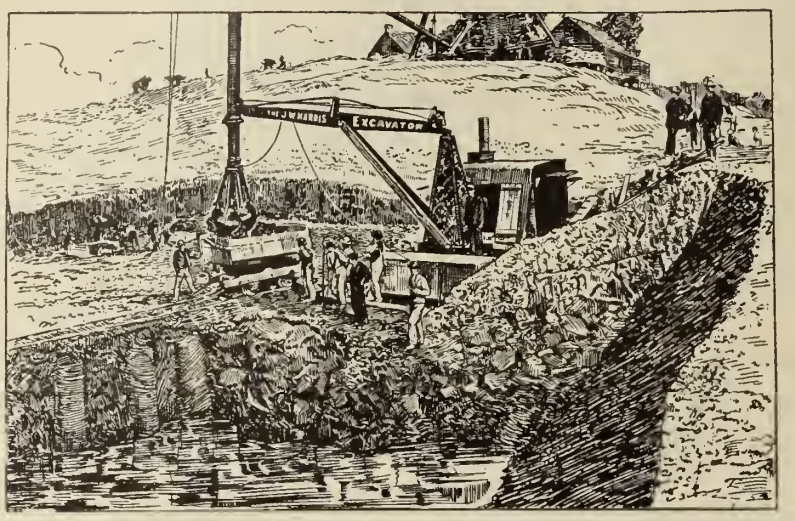
ATTENTION!

Railroad men and contractors for excavation work of any description should not worry about the scarcity of labor.

"THE J. W. HARRIS EXCAVATOR"



will take the place of at least **fifty men** and it **does not belong to any union;** it will do the work cheaper **than any other** known means of doing excavation.

The machine will work **the day after pay-day** and **will not kick if you want it to work overtime.**

Be sure and secure a machine for your summer work and do away with labor troubles and chances of losing money.

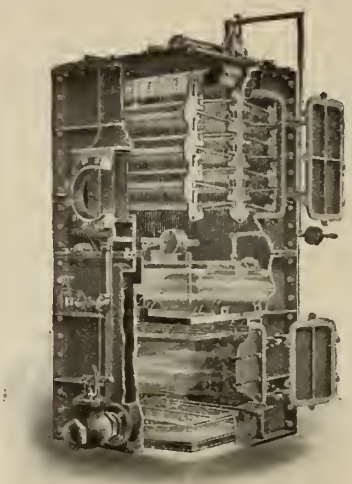
PERPETUAL SATISFACTION



That's what Webster Heaters mean to thousands; because they represent the genius and experience of the entire heating industry. Built on scientific principles they stay built.

THE WEBSTER

FEED-WATER HEATER

PURIFIER AND FILTER

The type shown in the cut is known as the Webster Class "E. C." Heater, made in sizes ranging from 500 to 1,500 h.p. This type assures economy while affording the greatest heating power and highest temperature. It cannot help saving fuel because it is impossible for it to waste steam.

We have interesting particulars to mail interested parties.

DARLING BROTHERS, LIMITED

Toronto Montreal Winnipeg

Graphite Paints

IT is well known that Graphite makes one of the best paints as a preservative of exposed metal work. It is the best paint to use for iron castings or girders on account of its filling properties thereby giving it a good covering.

Machine Paints

BESIDES the ordinary, our machine paints are made in paste form and can be used as a filler, applied with a knife or thinned with turpentine and brushed on, spreads freely and leaves a good surface.

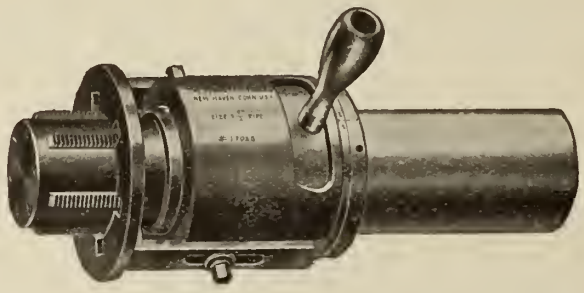
MORSE TWIST DRILL & MACHINE CO.

NEW BEDFORD, MASS., U. S. A.

Class "N" Adjustable Collapsing Taps



Don't you often wish you had just such a tool as this—a tool that would do a good job of tapping in the quickest, best and most accurate manner?

If so, write us, and we will be pleased to give you all information possible to enable you to understand the construction and working of same.

These tools are designed for use on either a drill press or turret lathe and are made in regular stock sizes from ¾-inch to 6 inches, inclusive. We make them in larger sizes, however, to special order.

Samples of work are always desirable to enable us to correctly understand the requirements of the work.

Write for more complete information.

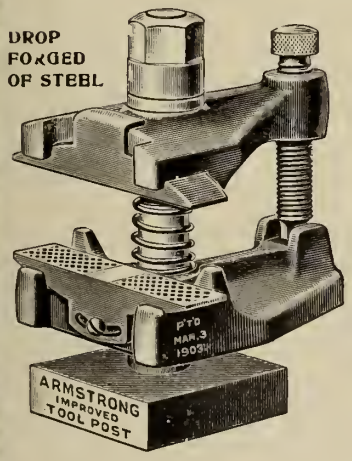
EASTERN SALESROOM
94 Reade St., New York

Armstrong Tool Holders

Have saved years of time and thousands of tons of Tool Steel, here's TWO NEW THINGS will prove an equally good investment.

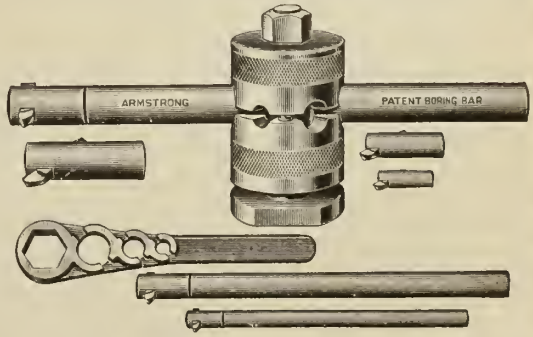


THE ARMSTRONG IMPROVED TOOL POST

Combines the strength and holding power of the strap and stud tool clamp with the convenience of the "open side" and ordinary set screw tool post. A slight turn of one nut releases tool or sets it solidly.

No trouble with "stripping" or "upset" screws.

The ARMSTRONG THREE-BAR BORING TOOL



INCREASES PRODUCTION AND REDUCES COST OF TOOL MAINTENANCE

CUTTERS CANNOT JAR LOOSE—
HIGH SPEEDS AND BIG FEEDS
—ONLY SET THEM TIGHTER

SOLD IN CANADA BY:—Williams & Wilson, Montreal; Aikenhead Hardware, Limited, Toronto; A. R. Williams Machinery Co., Toronto, Winnipeg, Vancouver; Wood, Vallance & Co., Hamilton; Frothingham & Workman, Limited, Montreal; H. W. Petrie, Toronto.

WRITE FOR OUR LATEST CATALOG.

ARMSTRONG BROS. TOOL CO., 106 N. FRANCISCO AVE. CHICAGO, U.S.A.

"THE TOOL HOLDER PEOPLE"

THE HYPER-ACME
CHAIN PULLEY BLOCK

The friction in this block is automatically cut off as the load rises, and consequently only the load being raised need be reckoned on, thereby reducing the power required by more than one half.

The ordinary screw block has only the single worm and that of a very fine pitch, thus making the process of raising very slow, whereas in the "Hyper-Acme" pulley block the room is of very coarse pitch, causing the load to rise with great speed. The lowering of light or heavy weights is done with ease and rapidity. Sizes from ½ to 10 tons carried in stock.

THE UNITED STATES

Threading Tools embody all the most up-to-date ——ideas in the use of high speed steel——

The shanks are made from a special grade of steel, nicely finished and case hardened.

The cutters are made from solid steel, milled to size, and accurately ground to gauge.

The only grinding necessary when the point wears down, is across the top. This is an important feature, as the average mechanic will consume considerable time grinding a forged tool to gauge, after the blacksmith has spent his time dressing the point.

The serrations in blade and shank allow cutters to be removed and re-set at exactly the same cutting point. This is a feature not obtained in other tool holders.

The angle of serrations is such that pressure on point forces cutter against shoulder of shank, thus preventing the tearing out of serrations.

Springfield, Ohio.

ENGINEERING:

AN ILLUSTRATED WEEKLY JOURNAL

Edited by WILLIAM H. MAW and JAMES DREDGE

PRICE SIXPENCE.

"ENGINEERING," besides a great variety of Illustrated Articles relating to Civil, Mechanical, Electrical and Military Engineering and Notes of General Professional Interest, devotes a considerable space in each issue to the illustration and description of all matters connected with the PRACTICAL APPLICATION OF PHYSICAL SCIENCE, and with its Wide and Influential Circulation in all parts of the world, this Journal is an

UNRIVALLED MEDIUM FOR ADVERTISEMENTS

SUBSCRIPTIONS (Home, Foreign and Colonial)

"ENGINEERING" can be supplied, direct from the Publisher, post free for Twelve Months, at the following rates, **payable in advance**:—

For the United Kingdom - - - - - - - £1 9 2

For all places abroad:—

Thin Paper Copies - - - - - - £1 16 0

Thick " - - - - - - £2 0 6

Subscribers residing abroad are strongly recommended to order copies on thick paper, as the illustrations are necessarily very much less effective in the thin paper edition, and to remit, when possible, by Post Office Order made payable at Bedford Street, Strand, London, W.C. When Foreign Subscriptions are so forwarded, advice should be sent to the Publisher.

Foreign and Colonial Subscribers receiving Incomplete Copies through Newsagents are requested to communicate the fact to the Publisher, together with the Agent's Name and Address.

Cheques should be crossed "Union of London and Smiths Bank, Limited, Charing Cross Branch."

All accounts are payable to "ENGINEERING, LIMITED."

ADVERTISEMENTS.

Prepaid Advertisements on Wrapper, **classified** under headings: Tenders—Appointments Open—Situations Wanted—Partnerships—Wanted, &c.—For Sale—Auction Sales—Publications—Miscellaneous—Patent Agents—&c.

By the Line—Four Lines or under, 3s., each additional Line, 8d. The Line averages Seven Words.

By the Inch—8s. per Inch Single Column, One Insertion.

5% *allowed on* 6, 10% *on* 13, 15% *on* 26, *and* 20% *on* 52 *Insertions.*

Advertisements intended for insertion in the current week's issue must be delivered not later than 5 p.m. on Thursday.

For Displayed Adveritsements, Special Terms are given.

Offices of "ENGINEERING," 35 & 36, Bedford Street, STRAND, LONDON, W.C.

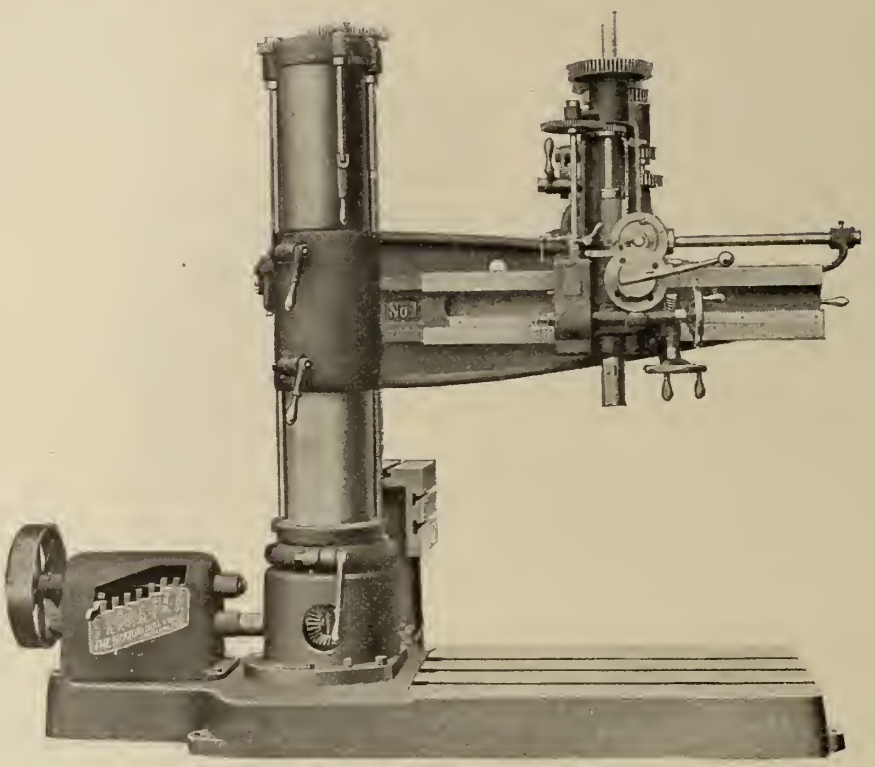
Our Latest and Best



Five years ago we brought out a line of IMPROVED RADIALS which to-day are known the world over. With this machine we introduced the SPEED BOX to the machine tool world and blazed a trail which has been followed by many copyists.

To this machine we have added—

A TRIPLE DRIVING GEAR on the head, operated by ONE LEVER and placed between the tapping attachment and the spindle.

A SPEED BOX WITH EIGHT SPEEDS operated by ONE LEVER which in conjunction with the back gears gives TWENTY-FOUR SPINDLE SPEEDS.

FULLY 50 % MORE DRIVING POWER, which means the STRONGEST RADIAL BUILT.

We have retained the following well-known valuable features—

The dial depth gauge. The automatic trip. The range of eight feeds. The pipe section arm. The double round column.

WE HAVE ELIMINATED all friction driving clutches in the speed changing mechanism.

After a long series of tests of every description we now offer this machine in three sizes—4, 5 and 6 foot arms.

We are confident that point for point an unbiased comparison will convince you that we excell in the following essential features: POWER, DURABILITY, SIMPLICITY and EASE OF MANIPULATION.

Our 1906 Radial Drill catalog tells the rest.

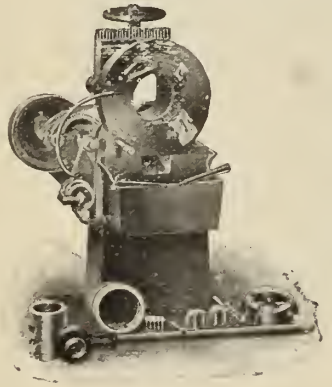
The Real Secret of this Combined Hand and Power, Stationary or Portable Merrell Pipe Threading and Cutting Machine lies in the fact that it is made of better materials than any other like machine.



There's less chance of breakdown, less chance of accident, greater capacity for work and the ability to stand up under the strain of continuous and extended operation.

Then, too, you should consider the many advantages peculiar to this Merrell, such as the improved Cutting-off Tools, the Removable Head, the Self-centering Vise, etc., etc.

If you wish we will send you this machine on THIRTY DAYS FREE TRIAL. It must make good or it costs you nothing.

GISHOLT TOOLS

THE profitable use of Turret Lathes depends largely upon the design and construction of the tool equipment. Without the knowledge of how to tool them properly, Turret Lathes would be of little more value than engine lathes. Long experience in making Turret Lathes and an equally long experience in making the tools for finishing work requiring boring, turning and facing, has given us a fund of information that will be invaluable to the manufacturer contemplating the finishing of this class of work. We have made tools for over 10,000 different pieces, and it is seldom indeed that a job now comes to us with which we are not already familiar.

This knowledge of tool outfits will enable us to tell you exactly what you may expect of our machine. If you have work of this class, it will be to your interest to take it up with us.

Our Turret Lathe Catalog will give you a very good idea of the great range of Gisholt Lathes.

is used almost exclusively on the standard motors because of its supremacy in the power-transmitting field. Adapted to short centres; damp, hot or oily places; and will run in either direction. Action always smooth and positive.

Some Features of Large Gas Engines

By Robert W. Angus, B.A.Sc. †

ALTHOUGH gas engines had been developed and constructed to some extent for many years, yet it was not until 1862 that the conditions governing their economical working were discovered by M. Beau de Rochas, a French engineer.

After a careful scientific study of the subject he found that high efficiency depended, amongst other things, on producing a high pressure at the beginning of expansion, a result which could be obtained by compressing the charge of fuel before ignition. This process had not been previously employed, and it is largely to it that we owe the success of the gas engine, although at the time of its discovery, the importance of compression was not appreciated, the development of the gas engine being along different lines, as is shown by the appearance, among others, of the Otto and Langen engine in 1866.

Beau de Rochas also described the cycle to be carried on in the cylinder according to the following scheme: (1) Outward stroke of piston drawing in charge of fuel; (2), inward stroke of piston compressing the charge; (3), firing of the charge with piston at the inner end of stroke; (4), expansion of charge after ignition during second outward stroke of piston; (5), discharge of products of combustion during second inward stroke of piston. This cycle will at once be recognized as the one carried out in all "four cycle" engines, so called because four strokes of the piston are required to complete the cycle.

The cycle thus described was first put to practical use in an engine built by Otto in 1876, and on this account has been frequently named the "Otto cycle," although to Otto belongs the honor only of constructing an engine working on Beau de Rochas' cycle.

† Professor of Mechanical Engineering, University of Toronto.

It quickly displaced all other cycles and put the gas engine at once in a firm position as a successful heat engine.

Since the time of Otto, the mechanical details of gas engines have been improved, and it is not often that a machine reaches the same state of perfection in so short a time, yet the original cycle is now very commonly used, and probably the great majority of engines of the present day employ it.

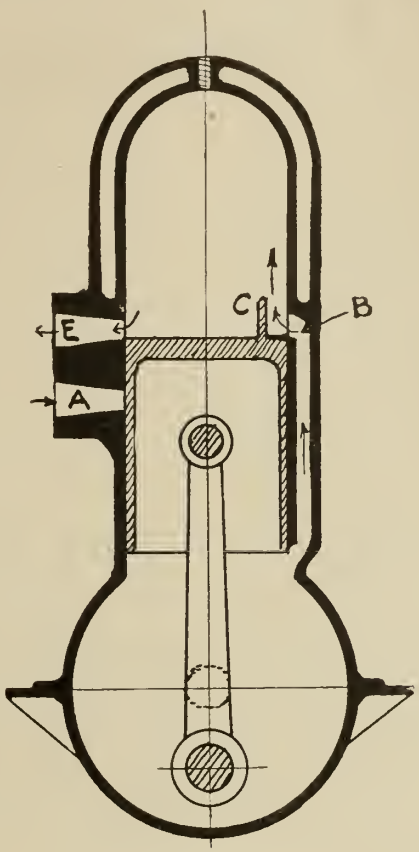

Fig. 2—Two Cycle Engine.

The engine of this type is so common in form and in such general use that it is unnecessary to describe it in detail, but it may be pointed out that the principal improvements have been in the way of substituting simpler inlet valves for the slide valves in the original engine, and in the substitution of more convenient and positive methods of ignition, and in suitable arrangements of parts for the development of large powers.

Small engines on the Beau de Rochas cycle are made single-acting, and this is also true of engines built by several continental firms in sizes up to 600 h.p. and even higher, and this, in view of the fact that there is only one power stroke per two revolutions for each cylinder used.

So long as the space occupied by the engine, or the steadiness of speed are not serious considerations, there can be little doubt that the single-acting, four-cycle engine possesses many advantages in the way of accessibility of the parts, notably the piston, and the greater simplicity of construction. But these engines have very large cylinders for the power developed, and must be fitted with enormously heavy fly-wheels to assure the steadiness of running required for the driving of electric machines. The size of the fly-wheel may, of course, be much reduced by using two cylinders in the engine, but the space occupied is rather excessive.

For large powers, therefore, some other method must be adopted, and at present there are two plans: (1), Either to make the "four-cycle" engines double-acting, or (2) to use some other cycle in which the number of power strokes bears a larger proportion to the total number of strokes than one to four. A cycle of the latter type was invented in 1880 by Mr. Dugald Clerk, in which a power stroke is secured in the working cylinder for two piston strokes, engines working in this way being called for obvious reasons "two-cycle" engines.

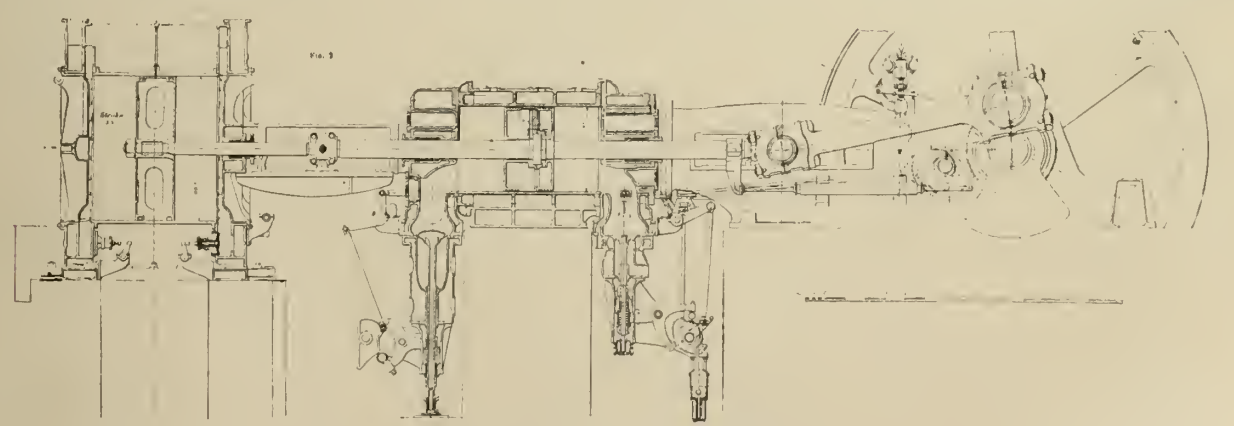

Fig. 1—750 H.P. Cockerill Blowing Engine.

Very large engines are frequently of the "two-cycle" type, and when made also double-acting two power strokes per revolution, are secured as in the double-acting steam engine.

An illustration of a large double-acting "four-cycle" engine is shown at Fig. 1, which represents a Cockerill engine direct connected to a blowing cylinder for blast furnace work. It will be at once noticed that this type of engine is more or less complicated, because a crosshead must be used and special water-cooling arrangements devised for cooling the valves, piston-rod, piston and cylinder, and also that a very carefully made stuffing box, which is extremely long in the engine illustrated, must be used to prevent leakage under pressures, which may be as high as or higher than 300 pounds per square inch. The arrangements for cooling water, as well as the valves, and the mechanism for operating them, are so clearly shown that no explanation is necessary.

pumps, which slightly compress the gas and air separately or together and deliver them to the cylinder at the end of the expansion stroke in such a way as to drive out the burnt products of combustion and replace these by a fresh charge of mixture ready to be compressed at the next stroke. In many engines of this type, especially larger ones, a charge of air is sent in ahead of the mixture, in order to prevent contact of the latter with the hot gases, as this is apt to cause explosion of the entering charge. This cycle is now extensively applied, as it may be used in small engines as well as in large ones and in all cases requires a smaller cylinder for a given power. Certain of the valves are also dispensed with and smaller fly-wheels may be used for the same steadiness in running, but the economy of the smaller engines at least, is not so great as in the "four-cycle" engines.

Fig. 2 shows an outline of a small engine of this type, which is quite commonly used in launches and for other purposes, the fuel being usually gasoline. In this engine there are no valves, and for the compressing pump a closed crank case is substituted in which the mixture is compressed. Beginning with the piston at the bottom of the stroke and on the point of ascending, the port (B) is open and the cylinder is filled with a charge of fuel which was compressed in the crank case on the previous down stroke. As soon as the lower edge of the piston rises above the port (A) the mixture is drawn into the crank case and compression takes place in the cylinder as soon as the top of the piston rises above the exhaust port (E). When the piston reaches its highest position the charge is fired and the downward or power stroke takes place, the burnt products discharging as soon as the piston uncovers the port (E). During this downward stroke the gas in the crank case is slightly compressed after the piston closes the port (A), and when the piston has moved down enough to open port (B), the charge of fuel passes into the cylinder, drives out the previously burnt gases, and is ready for compression on the next upward stroke. Evidently since (B) and (E) are open at the same time, some of the charge may pass out into the exhaust port and be lost. This is partly prevented by a baffle plate (C), cast on the piston. The simplicity and compactness of this engine commend it, so that it is quite often preferred to more economical machines.

In large engines economy is, however, usually a prime consideration, and hence they are not nearly so simple in construction as those described above.

Fig. 3 illustrates the Korting two-cycle double-acting engine, which is built in America by the De La Vergne Machine Co., of New York. The engine is built with one cylinder, in sizes from 500 to 1,500 h.p., all double-acting. Re-

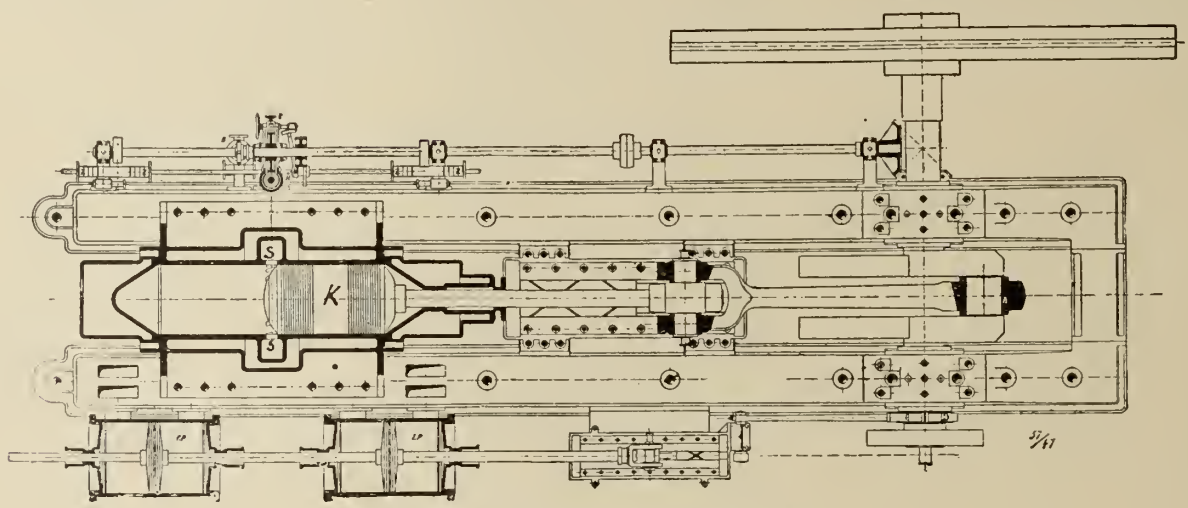

Fig. 3A—Korting Double-Acting Gas Engine.

This company builds engines up to 5,000 h.p., and has constructed single-cylinder double-acting engines up to 1,600 h.p., although for this power frequently two tandem double-acting cylinders are used, and for large powers two or more cylinders are also used.

Many other illustrations might be given of similar engines, as they are very common, but space will not permit. Small engines are very rarely made double-acting, as the arrangements required for cooling the pistons and rods, etc., would make the engine too complicated.

Coming now to the two-cycle engine it may be stated briefly that the ignition takes place at the inner dead point, and the compression and expansion strokes are the same as in the other cycle, except that the exhaust port is opened before the expansion is completed. The suction and exhaust strokes are not used, their place being taken by one or more separate compressing

ferring now to the figures, the piston (K) is seen to be very long, having rings at each end. There are two pumps, one (GP) for gas, and the other (LP) for the air, the gas and air being delivered separately at a pressure of about 9 lbs., and mixed as they enter the cylinder through the valves on top. The pump valves are so adjusted that the air pump first discharges a quantity of air into the cylinder, to sweep out the burnt products and prevent pre-ignition of the explosive gases by contact with the hot burnt gases. The gas and air pumps then discharge together into the cylinder, so that the explosive mixture follows a fresh charge of air, and not a charge of hot gas. A detail of the piping connections is given in the lower figure.

Starting with the piston at the crank end of the cylinder as shown, the exhaust ports (S) are uncovered, and the burnt gases from the previous stroke pass out of the head end. This is further facilitated by opening the back in-

let valve (E), which admits air followed by the explosive mixture from the pumps. At the beginning of the return stroke the inlet valve is closed and the charge compressed and ignited near the dead point.. The gas expands and is discharged as soon as the piston uncovers the exhaust ports (S). The action in the other end of the cylinder is exactly the same, and the engine thus receives two impulses per revolution. Evidently the length of the piston must be about the same as its stroke in order that the exhaust may be properly regulated, as no valves are used for this purpose. The piston, piston rods, etc., are water-cooled.

The Oechelhauser engine is shown in Fig. 4, since there are some features in its design worthy of note. It is also of the two-cycle type, and is probably more commonly used for driving dynamos than for any other purpose.

In the figure it will be noticed that there are three cranks, the outer pair being at 180 degrees to the inner one. The latter is connected directly to the piston in the power cylinder. The outer cranks are connected to a single crosshead behind the cylinder, and from this crosshead a second piston is driven in the working cylinder, the latter being open at both ends except for the pistons. It will also be noticed that these pistons always travel in opposite directions. To the crosshead is also connected a double-acting pump, which is used for compressing air in the end nearest the working cylinder, and the explosive mixture in the other end. The power cylinder contains the exhaust port (E), which is controlled by the left-hand piston, and ports (A) and (M) for the air and mixture, respectively, these

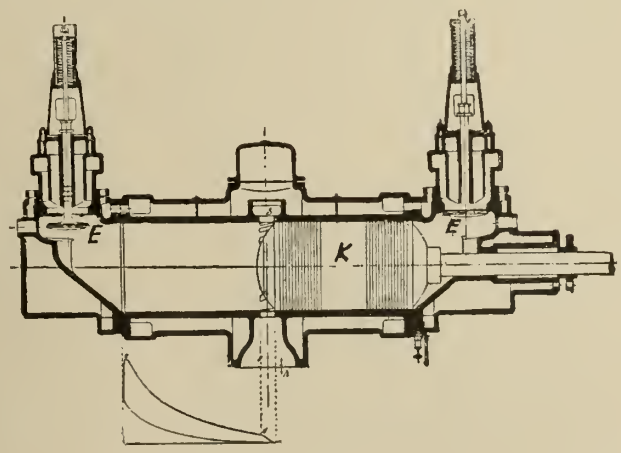

Fig. 3B—View of Cylinder and Valves.

ports being controlled by the right-hand piston. Pipes marked (A) contain air ; (G) gas ; (M) explosive mixture.

The method of operation is as follows: Assuming the two pistons in the positions shown, the port (E) is open, and the burnt gases are escaping through it, the ports (A) and (M) are also open, the former, which evidently opens in advance of (M), admitting first a charge of air, which is followed by a charge of mixture on the opening of (M). As the revolution continues the pistons approach each other, closing the ports (E) (A), (M), and compressing the charge, which is fired when the pistons are closest together. The pistons are then driven apart and the work done, the pistons uncovering the ports at the end of the stroke, and the cycle is repeated. Such an engine is, of course, very long, and there are some objections to the shape of the crank, shaft, etc., but on the whole the machine is simple in construction, does not require valves, and an explosion is obtained per revolution, no stuffing boxes being required in the working cylinder. It is possible that some of the working fluid may pass from (M) through (E) when both are open, but by careful design this loss may be made very small.

In the latest types of the Oechelhauser engine the tendency is to compress the gas and air separately and mix them as they enter the cylinder.

Fair comparison between the two classes of engines is rather difficult because it is not easy to get a good basis from which to judge. For launches and similar purposes the desirable condition is frequently that an engine shall be as simple as possible, positive in its action, and that it shall take up a minimum space. Economy of fuel is not such a serious consideration, as there

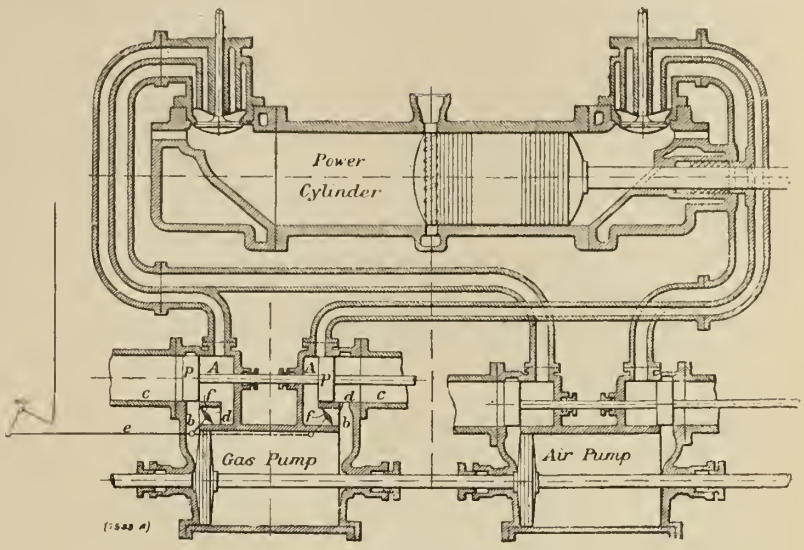

Fig. 3C—View Gas and Air Pumps.

is usually plenty of storage capacity for the supply of fuel necessary to make the short trips for which these launches are so commonly used. For such purposes, therefore, the two-cycle engines are quite popular, chiefly on account of their compactness and smoothness of running, and because there are no adjustments of valves to be made and little to go wrong, making them thus easily managed by inexperienced persons. Many persons prefer the larger four-cycle machines for this purpose, however, and apparently the decision as to the type depends on the reputation of the particular engine.

For large machines there are always experienced engineers in charge, and hence the choice of machine is governed by the first cost, the cost of operation and of maintenance, reliability of action and space occupied.

The two-cycle engine requires one or two extra pumps, which make it more complicated, but in connection with them it must be remembered that the pressures are small, and therefore these parts may be made very light, so that probably the friction loss is less than that resulting from the suction and exhaust strokes of the four-cycle engine. This difference again is to be set against the power required in compressing the gases.

The construction of the working cylinder is also simplified in the two-cycle type by the absence of exhaust valves and valve gears, which are a cause of trouble on account of the effect of heat on them, and valves are dispensed with altogether in the Oechelhauser engine.

At the same time two-cycle engines may be decreased in efficiency on account of some of the mixture passing out through the exhaust ports before the latter are closed, a difficulty which may be minimized in design. The reduced size of flywheels in the two-cycle engine has been previously mentioned, this being due to the fact that the turning moment of the shaft is subject to much smaller variations than in the other cases.

Some information may also be obtained from the following tables of dimensions of engines, some of which are from the builders' catalogues, and some from a paper by Mr. H. A. Humphrey, read before the Institute of Mechanical Engineers, January, 1901.

Dimensions of Some Large Gas Engines.

Type of engine or name of builder	I.H.P.	Two or four cycle.	Number of cylinders.	Diameter of cylinders ..... inches.	stroke ..... inches.	Revs. per min.	Kind of gas.	Fl or space occupied ..... feet.	Remarks.
Crossley.....	600	4	2	30	36	135	Blast furnace	.....	.....
Crossley.....	530 B.H.P.	4	2	28	36	130	Coal	27x16	.....
Premier.....	650	4	2	28	30	150	Mond	.....	.....
Nurnberg	545 B.H.P.	4	2	24	36	115	.....	46x15	Double acting tandem cylinders.
Cockerill.....	600	4	1	51.2	55.1	94	Blast furnace	36x20	Mechanical efficiency on test 73.1%
Westinghouse ...	621	4	3	25	30	149	Natural	.....	Mechanical efficiency on test 89%.
Korting	600 B.H.P.	2	1	27.5	48	90	.....	43x21	.....
Oechelhauser	600	2	2	18.9	31.5 each piston	135	Blast furnace	.....	.....

This table has been made up for sizes as near 600 h.p. as possible.

It may be of interest to state that the mechanical efficiency of a Cockerill engine by test was 81 per cent., the power developed being about 870 i.h.p., the engine having but one cylinder.

A test on a Korting engine with a double-acting cylinder 29.7 in. diam., by 55.1 ins. stroke, reported in "Power" for January, 1907, gives 607 b.h.p., and 789 i.h.p. in the power cylinder, with an i.h.p. of about 88 accounted for in the pumps. The total efficiency of the engine was 77 per cent.

With regard to the conditions affecting efficiency, the methods of ignition, the methods of starting large engines, and the special devices used in scavenging and governing, much might be said, but space does not permit. It is well to keep in mind, however, that gas engines are in the field to stay, that they are steadily being improved in construction and reliability of action, and that they possess greater possibilities in the way of efficiency than steam engines.

Builders are now able to guarantee that the consumption of coal per hour per brake horse-power will not exceed one pound, even on engines considerably under 100 h.p., where a suction producer is used. These suction plants also take up very little room.

It seems, however, that there is still room for improvement, possibly by a radical departure from the original cycle, and that greater developments along this line may yet be expected.

CORRESPONDENCE.

The following letter received at the editorial office of Canadian Machinery from the Northern Electrical Manufacturing Co., Madison, Wis., quoted in part, calls attention to a situation the existence of which we had not hitherto known. Any further information on the subject from readers of this paper will be appreciated.

Gentlemen:—

"We have found a very antagonistic sentiment against United States machinery on the part of the Canadian consumers.

In fact some stationers seem to carry rubber stamps furnished to Canadian manufacurers reading, 'We buy in Canada.' Several instances of this kind have come to the writer's attention recently and as the type of the stamp is uniform it thus appears to be an instance of the very general sentiment.

Very truly yours,
Northern Electrical Mfg. Co.

In illustrating the extent of the influence of Canadian Machinery, a letter received from the Scottish Highlands enquiring for this paper should be of interest.

Kinlochlevenonach,
January 5th, 1907.

Gentlemen,—Please let me know on what conditions you supply Canadian Machinery and Manufacturing News. Address,

WILLIAM McLARNON,
Kinlochlevenonach,
Inverness-shire, Scotland.

Regarding Boiler Inspection.

Canadian Machinery,
Toronto, Ont.

In a general way we do favor the universal inspection of boilers for the whole Dominion provided the inspection law is a good one and properly carried out. We find the inspection laws of the various provinces where they are enforced as a benefit as tending to bring about a higher class of boiler work, but, at present, there is considerable variation in the regulations of different sections and in the manner they are carried out, which causes considerable trouble to the boiler manufacturer who is supplying boilers to all the various provinces. It would be much better if there was a Federal law applying to all the provinces, or if the various provinces would adopt the Dominion Act, so as to bring about uniformity which would enable the boiler manufacturer to build a standard line of boilers.

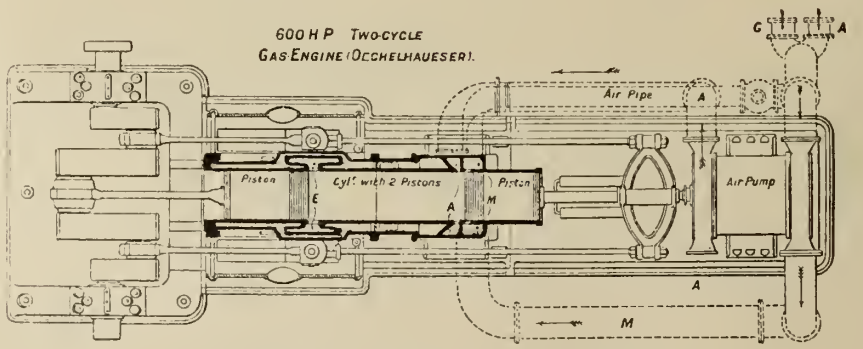

Fig. 4.—600 H.P. Oechelhaueser Two Cycle Engine.

Hoping these expressions of opinion may be of use to you, we remain,

Yours truly,
ROBB ENGINEERING CO. LTD.
D. W. Robb, president.

Economy of the Electric Motor*

By Kenneth Drinkwater

THE economy of electric power is now generally recognized but it may be interesting to you to know wherein this economy lies; how this motive power may be best adapted and to what a variety of uses it may be applied.

With regard to economy, perhaps the best illustration of this is in the industrial establishment where it is necessary to transmit power to a large number and great variety of machines. This can be done by employing a large motor to transmit power by means of shafting, belts and pulleys, or by using separate motors for each machine or group of machines. The greater economy is, of course, obtained by the use of separate motors.

When power is transmited by belts and shafts, the percentage of the total horse-power outpnt of the engine or motor which is actually useful at the productive machine, is at the best only about 77 per cent. That is to say, at least 23 per cent. of your available power is lost in transmission. These figures are based on horse-power required to drive the shafting and belting when running light. There is good reason to believe that these losses increase with the increase of load.

The disadvantages of long lines of shafting were realized long before electricity offered a way out of the difficulty. Unless the greatest care be used in keeping the shafting in alignment and the journals well oiled, the power wasted in friction of bearings and belts becomes a very large percentage of the total power received from the prime mover.

The friction loss is continuous even when, as is often the case in large shops, a single particular tool, like a large boring mill, has to run when all the rest of the shop is shut down.

The system of electric drive is the solution of this problem. It offers numerous advantages; the system is easily installed; and it is readily extended and maintained.

In the case of individual drives, the highest possible economy is obtained because the motor furnishes power only as required by the work of that particular machine.

There are, undoubtedly, numerous special requirements which can best be fulfilled by use of the individual drive, but in the vast majority of cases the application of an individual motor to each tool carries the matter too far.

Small motors like small engines are less efficient than large ones, besides costing very much more in proportion to the power delivered. The general plan which meets with the approval of the best engineers is to employ individual drives for tools which require variable speed drive. In addition to this it is often desirable to drive individually on account of the comparatively large amount of power involved in a single machine, or as is often the case, when convenience of location makes it desirable to isolate a machine, then the individual drive is indispensable.

Consider the case of a large works consisting of a number of shops. Evidently one steam engine or turbine cannot be used to drive the shafting in all the shops. It is necessary then to either install one large central plant and distribute the steam to engines located in each of the shops or in the case of a very large works to install a number of boiler plants.

The first cost of such installations is enormous; the cost of maintenance and attendance is very high and then there is always the possibility, in the case of a central plant, of some accident occurring which will close down the whole shop. Of course this is partially got over by duplicating the power plants, but then think of the cost.

The electrically operated works of today offers a striking contrast to this lay-out. The motive power is obtained either by installing electric generators or by getting it from outside sources. It is then transmitted by means of wires to all parts of the shop or shops, doing away with a large percentage of the loss formerly occurring in pipes, shafts, etc., since the loss in electric transmission is very small indeed in comparison.

This is got over in large up-to-date plants by the fact that alternating current is used for the majority of the works, and in the case of a breakdown, connections may be made in a very short time to outside sources. In small plants, the current is nearly always taken from the supply companies, and the risk of a shut-down, for any length of time, is very remote.

We now come to the varied uses to which the motor may be applied.

The decided advantages of the application of motors to machine tools in industrial work has been thoroughly exemplified in machine shop practice today. The conditions under which machine tools operate are so varied that it is impossible to make any general statement covering all of the possible operating conditions, but some of the individual conditions are always important, as, for instance, the character of the work machined, kind of material cut, shape of the cutting tool, quality of the tool steel, method of treating tool steel. All of these should be taken into account, to intelligently fit a motor to any machine tool.

The factors which have had more to do with the recent impetus given to the study of rapid production than any others are the high speed steels and the variable speed electric motors.

In the case of a machine requiring variable speed, the variable speed motor offers decided advantages in the way of rapid and economical production. With the old method of speed variation, by means of cone pulleys or nests of gears, only large increments of speed are obtainable. This invariably means that tools cannot be worked up to their limit of productive capacity. The variable speed motor may, in some cases, actually decrease the cost of the machine tool by eliminating extremely bulky and expensive mechanical speed changing devices.

Up to now I have not distinguished between the alternating current and the direct current motor. It might be of interest to know something about the desirability and economy of employing the one or the other.

The alternating current motor is singularly adaptable to planers, slotters, shapers or tools of a similar nature, in which reciprocating motion is employed, provided variable cutting speed is not an object. It is obvious that on the quick reverse with machines of this character, unless the motor is abnormally large, or a fly wheel be employed, there is imposed a considerable momentary overload upon the motor. These overloads will be more readily taken care of by the alternating current motor, than by the direct current motor, for the reason that overloads on direct current motors, if severe, will, if the overload capacity of the motor is not adequate, be accompanied by flashing at the brushes.

The alternating current motor is also singularly adaptable to grinding operations, to certain classes of wood-working machinery and to tools situated in places that are exposed to moisture, acid fumes or inflammable materials.

For group driving it is specially desirable, and for the individual drive where the conditions are of a definite character the outfit is ideal in simplicity of construction and general reliability.

* Abstracted from an address by Kenneth Drinkwater before the Y.M.C.A., Montreal, Feb., 1907.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

CONVENTION OF AMERICAN FOUNDRYMEN.

THE annual convention of the American Foundrymen's Association and the Foundry Supply Association will be held in Philadelphia from May 20 to May 24. Something was said last issue about the exhibits of the supply association; but the topic of chief interest to Canadian foundrymen at the present time is the probability of the convention being held in Toronto in 1908. At the New York convention in 1906, the invitation was extended by Toronto to the association to hold their convention in 1908 in that city. This was discussed at the Cleveland convention, and now arrangements are being made whereby all the particulars may be laid before the association at Philadelphia. Because of the difficulty and expense of moving the exhibits across the border, it is proposed to hold the convention jointly at Toronto and Niagara Falls, and the sittings of the convention being divided between the two cities; but it is possible that the convention will be held in Toronto altogether, and in regard to the bringing of the exhibits across the border, the Department of Customs, Ottawa, have made the following statement: "I beg to say that such machinery and apparatus as is imported for exhibition purposes only, will be allowed entry, subject to its immediate exportation at the end of the exhibition. Any articles, however, which are brought into Canada for sale will require to have duty paid thereon,"

In order that the convention might be held in Canada, it would be necessary for the Canadian foundrymen to form themselves into an association in order that there might be unity of action. The Canadian Manufacturers' Association are investigating this question, and it is probable that this will result in some sort of an understanding between the Foundry Foremen's Association in Hamilton and Montreal, so that a definite invitation may be extended to the American association by the Canadian Manufacturers' Association or by a united body of foundrymen.

The importance to the Canadian foundrymen of having this convention in Canada is great. The educative value of such a convention would be immense. The exhibits of the Supply Association are up-to-date and representative of all modern foundry appliances. The papers read before the convention are prepared by men of wide experience, and are, therefore, interesting and instructive. Then the personal element, that is, the gathering together of foundrymen from all over the country in social and business intercourse, resulting in the free interchange of ideas and experiences, which is of extreme value to the advancement of the science of founding and to the individual foundrymen, is of great importance.

It is only within the last few years that founding has been carried on in a way befitting its industrial importance; and the big factor in this advancement has been education. The convening of foundrymen annually, the presentation of papers, and displaying of up-to-date appliances, as is done at conventions is the most interesting and effective channel of education. Eleven years ago the American Foundrymen's Association was organized at Philadelphia, and undoubtedly the advancement of founding has been due in no small measure to the influence of this association.

The industrial expansion of Canada is but in its infancy; the prospects, for future expansion are dazzling. Founding will play an important part in this expansion. Therefore, Canadian foundrymen and Canadian manufacturers should be in a position now to develop the founding industry along up-to-date lines. At present labor-saving appliances are very scarce in Canadian foundries, and without doubt, one of the chief reasons for this is that those in charge have not come face to face with the numerous appliances which are now on the market. The holding of the convention in Toronto would be a means of bringing manufacturers and foundrymen into closer touch with modern ideas and efficient appliances in foundry practice; and besides being of great educative value would probably be the means of enthusing those interested in the formation of a Canadian Foundrymen's Association, in which many prominent foundrymen in Canada are much interested.

It is to be hoped that Canada will be well represented at the coming convention at Philadelphia, and that it will be possible to arrange for the holding of the next convention in Toronto, or in Toronto and Niagara Falls.

A WARNING.

THERE are several men who appear to be systematically going about the country soliciting subscriptions for the MacLean Trade Newspapers and Magazines and are pocketing the proceeds where they are able to land a subscriber. Several people have been victimized in this way. Some of these men are not confining their efforts to the MacLean papers, but, from enquiries we have received from one or two of our contemporaries in the United States, are practising the same methods in regard to their publications.

Business men and others are cautioned to look out for these fraudulent canvassers, and we would take it as a great favor if they would notify us by wire, at our expense, should they meet any of these men, as it is our intention to prosecute them if we once get the hands of the law upon them.

No one is authorized to solicit subscriptions for us unless he has our regular subscription forms and a letter signed by us giving him the right to receive moneys on our behalf. Our friends, the travelers, frequently send us subscriptions, and, of course, where a merchant knows a traveler to be a representative of a reputable house he may be sure that the subscription he may take will reach its proper destination.

We trust that our friends throughout the country will lend us their assistance in endeavoring to land these fraudulent solicitors. The names of the men and the localities in which they were last heard of are: C. H. Raymond, Berlin, Ont.; J. C. Murray, Farnham, Que.; McDonald, St. Hyacinthe, Que. There is another who operated in Galt, whose name we have not yet ascertained.

DEPARTMENT OF RAILWAYS AT McGILL.

THE McGill University have sent out a circular describing the courses in transportation which have been talked of for some time, and towards which the large railways are contributing. On the Advisory Board of this department are the following prominent men: Sir Thomas Shaughnessy, Chas. M. Hays, R. B. Angus, C. J. Fleet, E. B. Greenshields, Henry T. Bovey, dean of engineering, and Prof. Clarence Morgan. The department will be ready for the enrolment of students in the fall of the year.

There are three courses which may be followed in this department, namely, the operating department or executive offices, the motive power department, the engineering department, and that of maintenance of way. The entrance examinations and the first two years of these three courses are the same as for any other course in engineering at McGill. During the other two years of the first named course, there will be specialization in subjects such as, economics, elementary law, English, freight service, railway engineering, railway operation, stenography and structural engineering. The other two courses will follow closely the third and fourth years in the regular courses of mechanical engineering and civil engineering, respectively.

During many years to come, there will be immense enpansion of railways in Canada. There will be numerous positions of great and minor importance to be filled; and there are probably more chances of important and useful careers in railwaying in Canada then there are in any other industrial field. The courses will therefore be popular; and good work will no doubt be done if the courses are properly handled. From the names upon the Advisory Board this seems assured.

This is an indication that the railways recognize the value of a thorough training in fundamentals; and it is another step in the advancement of technical training.

ARTICLES FOR FOUNDRYMEN.

COMMENCING in this issue is a series of articles on Modern Foundry Practice, by Samuel Groves. The writer of these articles has been in close touch with foundry practice throughout his entire career in the United States and England; and the numerous ideas concerning modern foundry practice, which he has gathered, and which he is bringing out in these articles, will be of great value to foundrymen in this country. The first article deals largely with the historic side of foundry practice, but in the succeeding articles, the writer will plunge right into his subject of modern practice.

A PRESIDENT AT LAST.

THE University of Toronto has at last a president. The Board of Governors, after carefully surveying the field of available men, both here and in the Old Country, have selected Robert A. Falconer, M.A., B.D., LL.D., Litt. D., Halifax, as president. Dr. Falconer has had a splendid academic career, and is spoken of in high esteem by those who know him. He, therefore, comes to his most important position well recommended.

It is stated that the salary to be received by the new president will far exceed that previously paid, and $10,000 is mentioned as the probable sum. The responsibility of the office is great, and there is scope for the most important work, not the least of which is the influence a man in such a position can exercise over the men who are to be the future strength or weakness of Canada. A man fitted for this most important office is certainly worthy of a much higher salary than has heretofore been paid.

McGILL'S LOSS.

IN THE destruction by fire of the engineering building and medical building, McGill University has received a severe blow. The loss cannot be altogether estimated in actual dollars and cents, since some of the equipment cannot be replaced; and the inconvenience to which the authorities will be placed this fall will be great. But a monetary estimate of the loss in the engineering building has been placed at three-quarters of a million, with insurance of $420,000. This means an immense handicap to the university at a time when it can little afford it, especially in the engineering line. It is to be hoped that public spirited men with means at their disposal will come to the aid of McGill, as they have done in the past.

The engineering building was erected, equipped and endowed by Sir Wm. MacDonald, and was opened in 1893. This was the most perfectly equipped science building on the continent, with one exception, the recently completed science building at the University of Pennsylvania.

The Workman annex to the engineering building, although saved from destruction by the fire doors, was considerably damaged by smoke and water.

The Milling Machine vs. The Planer

By John Edgar

THE milling machine is slowly but surely encroaching on the field of the old-time favorite, the planer. It is not doing so with the ease that it takes to say the words, but with much opposition from those whom it will most benefit ; hence the following.

It is not so much that the milling

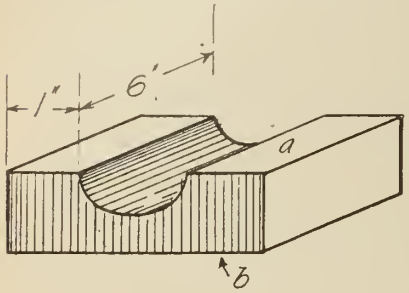

Fig. 1.

machine needs a champion that I take up the banner in its favor, nor is it on account of any real antagonism towards its opponents, but because it is struggling along, and making fair progress, against that foe of all new ideas, conservatism.

Many take as an issue the equipment necessary to the successful operation of the milling machine. Is not this theme sometimes set forth in a much exaggerated light ? Equipment we must have, but is it not necessarily so with any machine tool for its successful operation ? Even the planer—handy as it is—cannot claim much as a record breaker without some special tools or fixtures. Then why should there be all this hue and cry about such matters when comparing the results obtained with the milling machine.

Then again, we are reminded that cutters need sharpening occasionally and require some care in handling. Is there not a far better chance for the proper care and handling of the cutters used on the milling machine with less need of the personal element than is the case with the cutting tools of the planer ? This sort of argument may sound rash to some, but on a little consideration on their part it will be recognized as the truth.

Why is it necessary to associate an elaborate tool-room with the handling of the milling machine ? Surely in present day practice as found in the ordinary plant, where modern methods are appreciated, we have on hand all the necessary facilities for the proper sharpening of the cutters used on the milling machine ; and where it is used to a larger extent than that which would be termed common practice the extra amount of trouble, if such it may be termed, would be warranted by the increased output and the reduction in the cost of products that the miller is sure to show where properly used.

There can be no reasonable argument against the milling machine on account of the inability to obtain the cutters necessary or on the score that it is impossible to produce satisfactory results from home-made equipment, as there are in the market to-day several firms who are ready to give the service of their specialized plants to produce the best possible results in shape of cutters at no risk to the buyer. It is possible to get from such a source just such a cutter as the requirements of the special case call for.

When fitting up for the milling of a job the first cost is large and may seem exorbitant to many, but when the cost is taken per piece the results are more favorable to the milling machine than would be looked for under the circumstances by those unfamiliar with this kind of work.

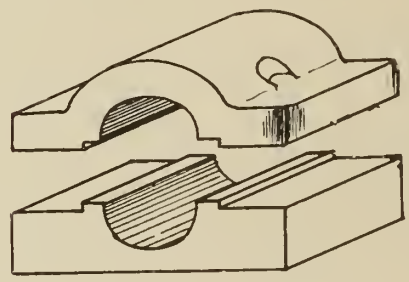

Fig. 2.

But it would surprise many, who are at present not familiar with the milling machine and its characteristics, to see what a favorable showing can be made with but a very meagre equipment. Many a job that does not warrant special cutters and fixtures may be handled on a milling machine to advantage and even under such circumstances give the planer a good run for the money. It is because many know the milling machine only by its reputation as a tool-room machine, fit for but the lightest work and such jobs that cannot be done on any other style of machine that the foregoing opinions are held. When you come down to the bare facts, there are but few jobs that a man can think of that cannot be done in some way on the milling machine of the universal type. Many, we must admit, would be rather out of place and impracticable, but others that are at present considered typical of the lathe and planer or shaper would, if it were only given a chance, be turned over to the milling machine as rightfully belonging within its field.

Is there in the present state of the arts a more economic method of removing superfluous metal than the milling machine ? It would be foolish to contest the fact that, on the milling machine, we can clear a larger area of the superfluous metal for a dollar than can be done on the planer ; so that we, in comparing the two methods, have sifted the matter down to the quality of the surface obtained. What better surface could be desired than that left by a milling cutter when run at a high surface speed, removing a light chip at a reasonably fine feed ? In fact, the grade of surface obtained is easily made to conform with the requirements by adjusting the feed and speed at which it is run. The cutter may be of the axial type or an ordinary face mill, but the results in either case are all that could be desired.

It has been my good fortune for a number of years to be situated where I could watch the growth of the milling machine and the planer side by side in their range of usefulness. The growth of the former in favor is beyond a doubt, and this growth has not been due to any sentimental reasons, but from that purely business reason—increased production for a minimum outlay. It might be mentioned here that had any especial pains been taken to push the miller the results would have been much more striking. The fact cannot be too loudly proclaimed that for equal outlay the miller can show the planer its heels on work that at present is almost exclusively done on the latter machine.

What the milling machine has accomplished in the small arms shop, the typewriter factory and the electrical works it can parallel on the heavier work of the engine works and other manufactories, where money-saving methods are sought and where rapid production of accurate work is required.

It is noticeable that the opposition the milling machine meets grows weaker with the installation of every machine.

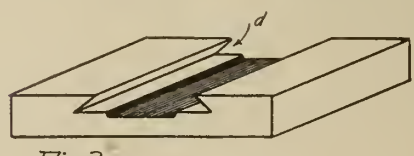

Fig. 3.

It needs no other advertisement than its own work. But we must not look forward to the day when the milling machine will completely supersede the planer, for the latter has its own field which requires a machine of its peculiarities. But we may look forward to the day, and that day is not far off,

when the milling machine will come into its own with all the glory that should crown such an event.

Facts to Substantiate Claims.

Having up to this point dealt in generalities, let us get down to facts that tend to show the truth of the foregoing claims. There seems to be a strong tendency to restrict the milling machine to just that class of work on which it has made its reputation and for which it was originally invented. It is on that class of work that competition has completely died out. Few, who have had no special experience with the milling machine, will concede the point that it, as a producer, is fit for any other class of work than that irregular work found in gun shops, typewriter factories and electrical instrument works. It is just on this point that I wish to take issue.

Let us take a few figures to show as a comparison the time required to machine a certain job, that shown in Fig. 1, on both the planer and milling machine. We will first deal with the top, (A). If we place this work on the planer—one having two cross heads—in two strings of 12 each, allowing one inch between each piece for clamping, we would have a stroke of about 7 feet. Suppose that the planer runs on the cut at 30 feet per minute, which is above the average, and has a return speed of 50 feet. The time consumed for each stroke would be $7 \div 30$ feet for cut, and $7 \div 50$ for the return, or, roughly, a total of one-third of a minute. Allowing a feed of tool of 1-32 inch we would have a total of 64 strokes of actual cutting. Allowing nothing for the time taken in running the tool across the gap, either by hand or power, we have as the time necessary for machining the piece, 21 1-3 minutes.

The feed of table of a milling machine necessary to accomplish the same amount of work under similar conditions would be $81 \div 97.3 = 4$ inches per minute, which is very reasonable on such a cut.

On a milling machine the number of strings of caps operated on at the same time is only restricted by the power and size of the machine. Two strings could be milled at the same time on a medium size column type machine, say a No. 3, while with a large size available, three or possibly four could be easily handled. Now in milling we have the alternative of short or long strings of caps. With shorter strings more frequent settings are required, but this is done without perceptibly increasing the time per piece, as would obviously be the case in planing. In fact, the shorter strings are to be advised on the miller as it allows of time between setting for the cutters to cool, increasing the run between grindings. Where the operator is running two or more machines and where the pieces are short, a longer string is necessary.

When we come to compare the time consumed in machining the base we have figures that speak well for the miller on work that one hears much claimed for as typical planer work. The width of this piece is, say, six inches, and when set as for the former operation the time consumed would be 64 minutes on a planer, whereas the miller could walk along at a feed of but 1.3 inches in order to equal that time; but as a matter of fact a feed of 3 inches would not tax the miller very heavily. This 3-inch feed would be obtained by the use of ordinary plain slab milling cutters. At that feed the surface ought to be sufficiently smooth and accurate for most cases. On wide surfaces such as this it is advantageous to sometimes resort to face milling, using a large inserted tooth face-mill either in a vertical spindle machine which is peculiarly adapted for that class of work, or in a horizontal spindle machine. The feed in such a case could easily be raised to 7 inches per minute and yet leave a surface which should satisfy the requirements of almost every case. The time required to machine the base with a face-mill would be,—allowing a 6-inch over-run of cutter,— $5 \times 6 \div 7 = 4.2 \div 7$ minutes, or $1\frac{1}{4}$ minutes per piece, as against $64 \div 1.3 = 5$ 1-3 minutes, the time per piece for doing the job on the planer, a trifle less than one-fifth as long for the miller as for the planer with a finish of the same quality.

The above figures have been for ordinary carbon steel; and had the high speed steels been considered the time would be reduced considerably, both for planer and miller, to the advantage of the latter.

The example given above is for plain work; but where the miller shows the planer its heels is on more irregular work, as shown in Fig. 2, which is similar to that in Fig. 1, except that the cap has a side fit (C). The job of fitting on a planer is a tedious one at best and one which is never of a duplicate character, while on the milling machine this job would be tackled with gang cutters and each piece would be a duplicate of every other as to the fit, and at a very great saving in time. Fig. 3 is another piece of work for which the miller is especially fitted, in that it is possible to produce work that is accurately formed. The angle (D) has long been an irksome job for the planer-hand, but it is handled as easily on the miller as is a plain surface.

Who but those who have "hooked" out a tee-slot on a planer can appreciate the gain and the ease with which the operation is performed on a miller. Such a job is illustrated in Fig. 6. So apt are we to look with prejudice upon an innovation in shop practice that it is hard to convince without actual trial, that, on the work shown in Figs. 4 and 5—a planer table and a lathe bed, respectively—the milling machine is a keen competitor of the planer. But what better job could be handed to a milling machine! Here we recognize the desirability of duplicate, accurate work. What easier way of producing such work is there than with the miller! A job

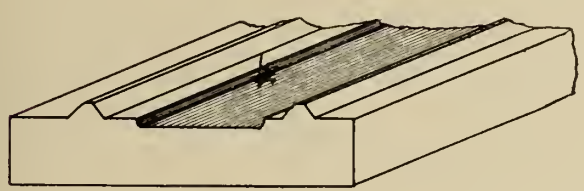

Fig. 4.

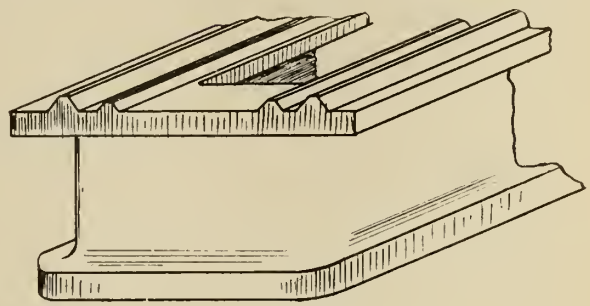

Fig. 5.

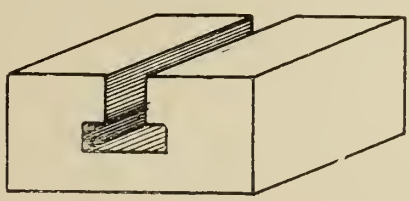

Fig. 6.

of this kind would of necessity be handled with gang cutters. The removal of the majority of the stock would be done first and the casting allowed to season, as is the practice when planing. Then, when required, the finishing chip may be taken, removing with sharp cutters only that metal which is necessary to take the wind out of the surface. You say that it would take too much care on the part of the operator; no more so than should be taken at the planer. There is this much to be said: that once the work is set and the machine started, the operator is at liberty to turn the most of his attention to some other duties; not so with the planer, as the operator must hang over the machine and give his undivided attention to the work on that machine, in order to obtain satisfactory results.

Equipment of Miller.

As mentioned above, the equipment is a point on which we hear a lot of argument. Why go to extremes in comparing the points of one method with another? Some cases warrant a very extensive equipment while others do not. "What should be called a good equipment, and what would it cost?" would be a matter-of-fact question. Take the horizontal spindle column type machine, and with a good assortment of cutters amounting to a matter of 75 or 100 dollars; with this you would be prepared to tackle any ordinary work that would be liable to present itself. The selection is, of course, dependent upon the size of the machine and general class of work it is to be used on. The vertical machine is, by the nature of its design, capable of handling a very large class of work with a much more limited equipment than is the horizontal machine. In its case a few well assorted end mills and a large face mill or two would be quite ample for most cases and is in fact all that is necessary for the successful operation of the machine. The amount and quality of work depends under such circumstances much upon the operator, as is the case with the planer. It seems to be the common thought that the milling machine may be placed in the hands of incompetent workmen without affecting the results. It is far from the truth; the results depend much on the operator in ordinary work. Unless the work is of a special nature and is handled by the aid of special equipment, the personal factor enters very much into the question. Thus unless we have these special features we must make up the deficiency by employing more intelligent help. We do so in the case of the planer, why not in the case of the miller also?

It is to be hoped that in the near future we will see an impartial division of work between the planer and its competitor, the milling machine, to the glory of each. This will surely take place as the milling machine begins to fill in the gaps and shows what a cost reducer it really is.

Said the Turbine to the Coal Pile

By C. J. S., Montreal.

WITH the coming of the steam turbine we were told that it was the engine of the future; that is but a few years ago. Again, only the other day, Dr. Riedler, speaking to the Society of German Engineers, said, "The turbine is no longer the motor of the future;—it is the steam engine of the present." There is certainly much to support such a view. At the same time, the present steam turbine has a few weak spots; and the reciprocating engine a few strong points. Yet, in its way, it is curious that those stoutest and most uncompromising in defence of the older form of power plant, are perhaps least competent, by training or experience, to give a sound opinion. We can understand how men used to only one type of machine would be prejudiced; but the engineers running turbines—the marine engineers in particular—are men who have served their time with triple or quadruple expansion engines. To them turbines mean a change, with a whole engine pathology to relearn; yet not one of these men would willingly go back to pistons, on an even choice. From the engineer's point of view, it is being more and more recognized that the turbines take more observant attention, but less work.

Then in the all-important matter of coal consumption, engine-room gossip has it that the Allan Line's "Virginian" was doing the trip from side to side last season on a third less coal than the crack Empress boats, and at a shade better sea speed. It is generally credited that she has never had the steam the turbines could use—not even on her trial run, when she logged within a fraction of 20 knots.

It is said that on her best trips last year the fires were burning 28 lbs. of coal per sq. ft. of grate area, for days on end, probably a record in itself, for the New York fliers think they are working hard when they do 25 lbs.; but even at this limit of a stoker's endurance the boilers could not hold the turbines going without throttling; and, of course, in a Parsons turbine, throttling means lost work.

The tendency to give their turbines too much initial steam area seems to be a failing of Parsons' marine designers, and has gained for their machines the reputation of "great steam eaters."

In the case of the Cunard "Carmania" the steam consumption was so excessive that it was found necessary to bend in the blades of the first few rows, that the boilers might hold the requisite working pressure. This expedient, while it improved the working condition, probably affected the efficiency adversely. Rumor had it that "too many cooks" and "the broth" was part of the trouble. The Cunards did things in a large way, and organized a "board of advisors," of very distinguished attainments. While this may have assisted Parsons in a well-merited advertisement, it is claimed it gave no material assistance to the shop's designers. It is to be sincerely hoped that both lessons have found application in the new 25-knotters, now being engined. But, apart from these much-noised-abroad tendencies to overwork the boilers, both land and marine turbines have shown remarkable overall economy. That is to say, while the steam consumption is large for their size, it is used most efficiently.

Although figures are somewhat jealously guarded from competing lines, yet it is known that in some of the passages of the "Carmania" and the "Virginian," the coal economy has surpassed even the best trial performances of triple expansion engines of any size, and not excluding special naval trials—not, as a rule, to be compared with the conditions of a working voyage. When we have the great 14 ft. dia. rotors in the turbines of the "Lusitania" and her sister ship, we may expect a performance that will silence once for all carping criticism of the turbine, for marine propulsion at least. For there is every reason to believe that the economical advantage of the turbine increases with its size and horsepower.

For central station work, there is only one engine-room growl, to keep the generator cool. It is claimed the proximity of the electric generator to radiating steam surfaces, and heat transmission through the shaft is not good for the output

Consideration of Canadian Patent Act

Compulsory Manufacturing Requirements of the Canadian Patent Act, Viewed in Reference to Dependent Patents.

By Egerton R. Case, Toronto.

Registered in accordance with the Copyright Act.

(Continued from last issue).

From the foregoing paper, we obtain the following deductions : That the owner of a Class B-C patent is in the following predicament : (a) The Patent Act punishes him by destroying the validity of his patent if manufacture thereunder is not commenced within the authorized period, and (b) the same Act offers him no positive relief for compulsory non-manufacture. He is left, as best he may, to make suitable arrangements with the owner of the Class A patent, in order to keep valid his patent. Under certain conditions, the owner of Class B-C patent is at the mercy of the owner of Class A patent, and for the reasons before set forth, this should not be the case. To the most heedless it is quite evident that his interests should have proper recognition under our Patent Act.

Because of the foregoing disabilities to which Class B-C patents are liable, we reach the following conclusions : firstly, that as our Patent Act now stands, it cannot, under certain conditions, give protection to Class B-C patents beyond two years from their date, or an authorized extension of that time, (supposing the commissioner's extension of the two-year period is valid as applied to a Class B-C patent) ; secondly, that the owner of a Class A patent is treated more favorably than the owner of a Class B-C patent ; thirdly, that the owner of a Class A patent has an unfair advantage over the public generally in that he can manufacture under a Class B-C patent as soon as same lapses, thus deriving greater benefits than he ought to derive, because (a) as he owns Class A patent, and although Class B-C patent has lapsed, he has, as a consequence, the monopoly of the invention covered by Class B-C patent, and (b) as a consequence he can market the two inventions merged into one article, or he can manufacture the invention covered by Class A patent possessed of its own identity, and so make the public pay double tribute to him. The full usefulness of Class B-C patent does not belong to the public until the Class A patent expires, which is quite right and proper ; but it is clear that the owner of Class A patent should not be in a position to enjoy the fruits of the invention covered by Class B-C patent after the manner that our Patent Act now permits.

This paper is not written with the view to altogether point out how our Patent Act may be amended to give ample protection to all classes of inventions, as it is primarily for the purpose of pointing out wherein our Patent Act is very faulty. It is suggested that our Patent Act be amended by striking out Sub-section (a) of Section 4, and providing a section whereby when it is impossible to manufacture under a Class B-C patent without necessarily infringing a Class A patent, that this Class B-C patent be protected from nullification. To provide for Class B-C patents, we can adopt a portion of the French Patent Act, as the latter part of paragraph 2, article 32, provides for an excuse for non-working. The above or similar provisions are necessary in our Patent Act as it now stands, for the reasons amply set forth hereinbefore.

I have looked into this question relative to Class B-C patents in foreign countries very carefully, and here state results of my inquiry.

In the United States, the owner of a patent is under no obligation to manufacture, nor is he compelled to grant licenses; therefore it will be seen that the holder of a Class B-C patent, while he cannot manufacture under his patent, is not wrested of same because of his enforced inactivity. Suppose a Class A United States patent is fourteen years old. Now the owner of Class B-C patent will only have to wait three years until he is perfectly free to start manufacturing. He may manufacture the invention covered by Class A patent, and market it, or he may incorporate his invention covered by Class B-C patent in the invention covered by Class A patent by re-organizing or re-constructing this latter and market the product. What a grand privilege the owners of Class B-C patents in the United States enjoy as against the severity inflicted upon the owners of the same class of patents in Canada by our Patent Act as it now stands !

In Great Britain, a patent cannot be upset through non-user or non-working.

In Belgium, Class B-C patents will expire with the expiration of Class A patents.

In France, the law courts have considered the question relative to Class A and Class B-C patents, but same has not been decided in such a manner that definitive information can be had in relation thereto. As a general rule, the French law cannot oblige the owner of Class B-C patent to work same when the same law would punish him for so doing. In order to provide for Class B-C patents, Paragraph (a), Article 32, of the French law provides for an excuse for the non-working of this class of patents. But if it could be proved that the owner of Class B-C patent could have obtained a license from the owner of Class A patent, and could consequently have worked his patent, it is more than likely that the French law courts would upset Class B-C patent.

Neither in Norway nor Sweden does the Patent Act of these countries make special provisions for Class B-C patents. But in Denmark, the Danish Patent Act empowers the commissioner of patents to grant Class B-C patents. As far as I have been able to ascertain, no court in the above-mentioned Scandinavian countries has been called upon to decide as to how the working provisions of their respective Patent Acts are to be complied with in case the owner of Class A patent will not grant licenses on reasonable terms.

As regards Austria, Article 21 of the Austrian Patent Law states as follows :

"The patentee of an invention which cannot be worked without using a previous patented invention, has the right to ask from the owner of the prior patent the grant of a permission to use the same, provided that three years have elapsed since the date of publication in the patent journal of the previously-granted patents, and provided that the latter invention is of considerable industrial importance.

"The license granted entitles the owner of the prior patent to ask on his part for a license from the owner of the later patent, which gives him power to use the later invention, provided, however, that the later invention is in real connection with the previous invention."

From the above, one will readily understand that the owner of Class B-C patent may compel the owner of Class A patent to grant him a license.

There is no provision in the Italian, nor in the Hungarian patent laws, similar to that of Article 21 of the Austrian patent law. But in Italy and Hungary the owner of Class B-C patent would comply with the working requirement of their respective patent laws if within the term fixed by the patent laws of the

said countries, he have advertisements published or direct offers made to Italian or Hungarian manufacturers (as the case may be) by which the holder of Class B-C patent would prove his readiness to have his invention industrially worked in those countries, and to permit the use of same by the grant of licenses to manufacturers, Italian and Hungarian. It would seem that it would also be wise for the owner of Class B-C patent to make direct offers of a license to the owner of Class A patent.

In Spain and Portugal there appear to be no special provisions in the respective Patent Acts for those countries covering the relationship of a Class B-C patent to a Class A patent.

As regards the German Patent Law, I have not been able to find out that it covers fully the question I have brought up relative to the relationship of Class A and Class B-C patents. It would seem that the general opinion is held in Germany that if the improvement covered by Class B-C patent is a material one surpassing the invention covered by Class A patent in its technical results, and if the owner of Class B-C patent be using only a small part of the invention covered by Class A patent, then in such a case the owner of Class A patent would not be entitled to prevent the owner of Class B-C patent from using the invention covered by Class A patent. On the other hand, if the invention covered by the Class B-C patent is of a very small character, then, of course, the owner of Class A patent would be fully justified in not granting a license to the owner of Class B-C patent, because the invention covered by Class B-C patent would almost wholly derive its benefits from the invention covered by Class A patent.

Montmorency Falls, Quebec, One of Our Water Powers.

As regards Switzerland, at the time the Federal Parliament discussed the Patent Act, it was clearly shown that the interpretation to be given to Section 3, Article 9 thereof, is that the working of a Swiss patent may take place in any country. Therefore the manufacture of an invention patented in Switzerland, in the United States or Canada, for instance, will comply with the conditions of the Swiss law, which requires that an invention be worked within three years from the date of application of the patent covering same.

The Japanese law requires that an invention be worked within three years from date of issue of the patent.

My agents in France, closely associated with the International Congress of Industrial Property, recently write me, and state that: "In the near future, it is expected that the continental nations of Europe will temper, if not entirely abolish, the working clause contained in their patent laws. At the last meeting of the international association, held this year (1906) at Milan, Italy, a resolution was passed advocating the abolition of that clause and its being replaced by the so-called compulsory license system, thus suppressing forfeiture for non-working. It now remains for this resolution to be taken into account at the next meeting of the delegates of the states comprised in the National Union, and if the delegates adopt the suggestion, the resolution will become law by way of a further additional Act to the convention of 1883."

For a long time prior to the above-quoted letter, I had in mind the preparation of a paper calling attention to the disadvantages of our Patent Act as it now stands.

What I have herein stated applies to arts, machines, manufactures, and compositions of matter.

The present chiefs of our Canadian patent office are to be highly commended for having adopted the compulsory license clause, and it is to be hoped that they will, in the near future, so amend our Patent Act as to relieve the holders of Class B-C patents of the disabilities under which they now labor.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

Modern Foundry Practice

By Samuel Groves

THE art of founding in metals is of very ancient origin. History reveals it as being in existence at the earliest dawn of civilization. In Gen. iv., 2, Tubal Cain is described as the instructor of every artificer in brass and iron.

An historical retrospect showing the lines along which founding has progressed from primitive times up to now, would make an interesting story; but our purpose is entirely practical, hence, while a study of the rule-of-thumb methods practiced in ancient foundries might serve to pass a pleasant hour, it certainly would not be as profitable as a careful exposition of the science of founding in well equipped, modern workshops. Before going right to the heart of our subject, however, I may say that there is something almost pathetic in the passing of the old-fashioned, illiterate, but skilled resourceful moulder of the ancient regime; who knew nothing about metallography: cementite, pearlite, etc.: chemistry: carbon, silicon, etc.; static pressure on moulds; or the scientific values of silica, alumina, etc. in sands; but who, the moment a complex pattern of magnitude was placed before him, knew how to design a flask for it, grade and manipulate the necessary sands and facings; fix cores; select metals, and finally produce a sound casting with a skin fair to see. James Hemphill, founder of the firm which has built nearly every large rolling mill plant in the United States, was once asked, what, in his opinion, constituted a good moulder? He replied: "The best moulder is the man who has the greatest number of tricks up his sleeve." This sagacious, picturesque type of moulder of the old school, is fast disappearing, and a new order of technically trained mechanic is taking his place.

Fig. 1—An Ancient Foundry.

In connection with the Carnegie Technical School, Pittsburgh, is a model foundry, equipped with cupolas, moulding machines and labor-saving appliances, under the supervision of scientifically trained teachers, specially selected for their practical knowledge of founding. Similar departments are in existence at Purdue and Cornell Universities; showing that American educationalists are fully alive to the economic importance of this branch of industry. In a little while there will be no difficulty in finding men thoroughly equipped theoretically and practically to fill postions of trust in great foundries of the United States. Alas, Canada is doing nothing whatever to train her young men along these lines. But something should be done and done quickly, too, if the Dominion is to hold its own in the industrial competition of the world! We have already commenced to develope the great mineral resources of the country, and in manufacturing should begin where the United States and European countries leave off.

The aim of the following series of articles will be, to set forth graphically, the latest methods and developments in modern foundry practice; in the hope that they may be of practical value to many a manufacturer, foundryman and engineer of works. And if they do something towards attracting the attention of the directors of our technical institutions to the rank folly of utterly neglecting the subject of founding, in our halls of learning, another object will have been achieved.

The Renaissance of Ironfounding.

In days gone by, the mechanical genius of the world was largely concentrated on the invention of special tools and labor-saving appliances for handling and finishing rough castings in the machine shop; while the foundry where the castings were made, was left to struggle fitfully along with its antiquated cupola, erratic fan, dangerous drop ladle, stationary jib crane, wasteful core oven, primitive hand riddle, flexible wooden flasks and costly patterns—all operated and applied by rule-of-thumb. During the last ten years, however, a startling change has come over the scene. The foundry, like all things suitable and necessary to the ascent of man, has been passing through the evolutionary process. Dark, gloomy, comfortless foundries, stifling hot in Summer, intensely cold in Winter, and devoid of adequate ventilation, are no longer universal; for in the great industrial centres may now be seen well-lighted and admirably ventilated shops, with walls of brick, or concrete-steel, and equipped with electric traveling cranes, trundle-

geared ladles, sand sifting machines, drop bottom cupolas, tumbling barrels, pneumatic riddles, rammers, chippers, hoists and mould cleaners, portable mould driers, cycloidal blowers, pyrometers, rolling doors for ovens, core-making machine, testing apparatus, and wonderfully conceived moulding ma-

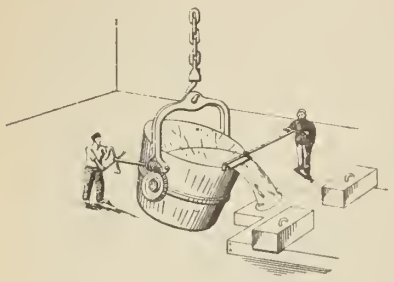

Fig 2—Nasmyth's Ladle.

chines—which are fast transforming the iron founders' craft from an art into a science.

In the larger of the 5,000 or more foundries in the United States, most of the machines and appliances enumerated are to be seen; but it is a deplorable fact, that in both Great Britain and Canada, these labor-saving devices are—with the exception of an isolated shop or two—conspicuous by their absence. The remarkable progress made in the United States has taken place since the establishment of the American Foundrymen's Association, in 1896. At the annual conventions manufacturers or their representatives have taken every advantage of the new ideas advanced, and economic problems solved in the papers read and discussed before this powerful organization, by West, Keep, Moldenecke, Mumford and other well-known foundry experts; hence, the transformation scenes beheld in many

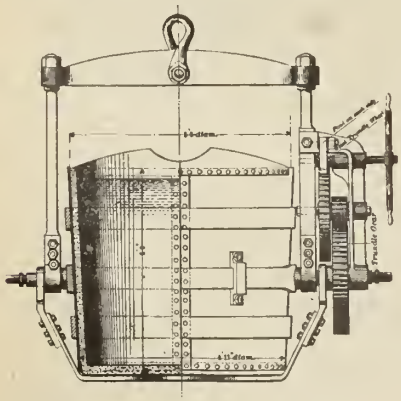

Fig. 3—An 18-ton Trundle Geared Ladle.

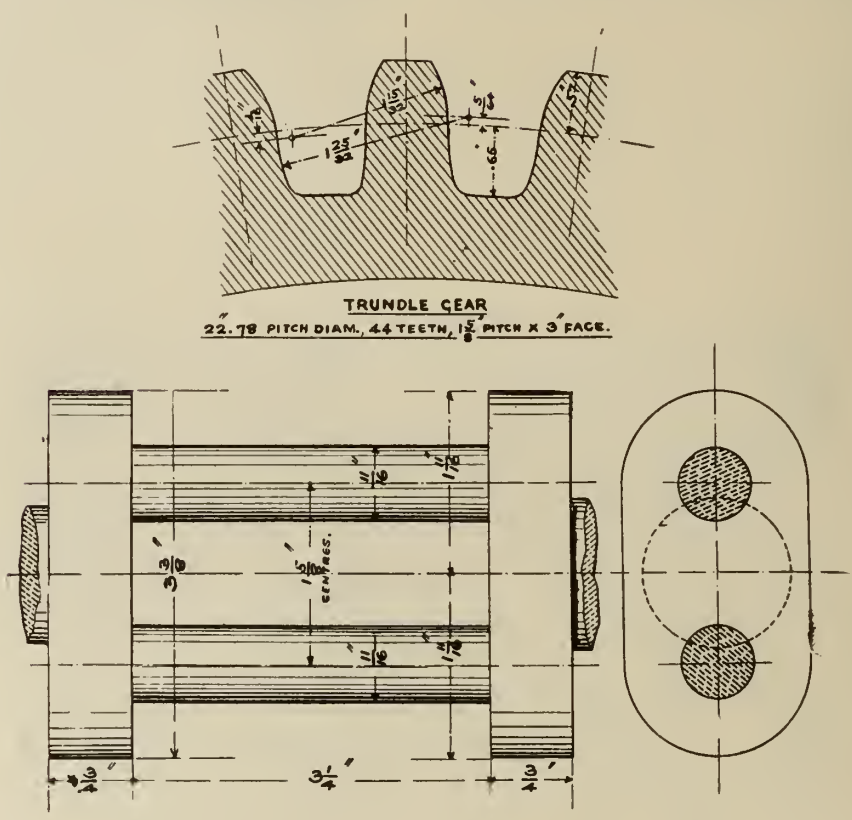
an old and fine equipment in many a new American foundry to-day. Instead of the crude methods of handling material and chaotic condition of things which characterized the average foundry twenty years ago; one can now perceive a rapidity of action, systematic method of handling and general orderliness which is manifestly conducive to the more economic production of castings. The first cost of these labor-saving installations is, no doubt, considerable, but those who have taken the risks are now reaping a rich reward in the shape of continually increasing profits. Many an engineer in charge of a manufacturing plant is regretting that he so long neglected the foundry, since he is now getting better castings, increasing the output, decreasing the percentage of loss and producing at a much lower cost.

Nasmyth, The Pioneer.

Prior to 1838, the hand power jib crane was practically the only labor-saving device to be seen in the foundry. About the date mentioned, however, James Nasmyth—immortalized in Smiles' "Lives of the Engineers"—invented the application of the worm and gear for mechanically operating foundry ladles (Fig. 2). He never made anything out of the patent, for he had drawings of the device prepared and distributed to the principal existing foundries free; since he looked upon his invention not only as a labor-saving, but as a life-saving device. In the pouring of heavy castings, serious accidents had occurred by the overturning of large ladles full of molten metal. Well do I remember as a boy in the "seventies," seeing five-ton ladles operated by hand, with six men on the tilting and steering handles. When the metal splashed out of the runner gate over the laborers, it was no uncommon thing to see them scamper like rats, leaving the skilled moulder controlling the pouring operation, with the whole resistance thrown on his muscles. Sometimes the strain was too much, and over went the ladle with its molten contents.

A still further advance in ladle mechanism was the introduction of the well-known trundle gear, in which the first motion shaft pinion has only two teeth. The first I ever saw was in the Walker Manufacturing Company's, Cleveland, Ohio. In 1895 the writer designed the 18-ton ladle with trundle gear, shown in (Fig. 3).

By means of this ladle, together with an old 9-ton ladle—which he remodelled and fitted with the trundle gear operating mechanism as illustrated in detail (Fig. 4)—castings were poured weighing over 20 tons.



DETAIL OF STEEL TRUNDLE PINION.

Fig. 4.

The mechanical advantages of the trundle gear over the worm gear as applied to ladles, are manifest. In the first place, the efficiency of the worm and worm wheel is the lowest of all forms of gearing, since they consume by friction one-quarter to two-thirds of the power received. True, it is safe, but the trundle gear is equally safe when rightly designed, and much quicker in action, while the objectionable "drop" common to all crane ladles, may by this

device, be reduced to a minimum. In fact, we have in the trundle pinion an ideal prime mover and mode of motion for metal pouring.

The only instance of trouble that I ever heard of, was on a ladle where the pins were defectively secured to the housings, and the trundle pinion itself placed on the second motion shaft instead of the first, subjecting it to the abnormal stresses transmitted by the compounding of the gears, thus abrogating largely the mechanical advantages claimed. I well remember the pleasure pictured on the face of a well-known Pennsylvania consulting engineer, as he witnessed the rapidity with which one man on the "pilot" wheel, reversed the 18-ton ladle (Fig. 3) when about 12 1-2 tons of metal had been poured into a mould, and the foreman cried "Up!" Indeed, there is as much difference between a properly designed trundle-geared ladle, and one fitted with the old Nasmythian worm gear as there is between the antiquated, slow-running horse cars and the swift-moving electric cars of our modern streets.

Before passing from the subject of ladles, one may opportunely refer to a most reprehensible custom practiced in some foundries to-day, which deserves a passing word, and that is, the daubing and lining of comparatively large crane ladles with common clay wash and fire clay only. All ladles—five ton capacity and upwards—should be lined with split fire bricks 8x4x2. By this plan, not only is the danger of burning the shell avoided, but the metal may be kept hot much longer, since the latent heat is not dissipated by radiation. It is true, that a brick lining is a laborious job; but it may be kept clean and intact a long while if a few handfuls of Dr. Kirk's flux is sprinkled on the bottom and around the sides of the ladle before the metal is tapped out of the cupola.

(To be continued.)

Manganese in Low Silicon Iron

By J. F. Gaffney †

IN cast iron having from 0.50 per cent. to 0.70 per cent. silicon, the addition of manganese above 1.38 per cent. gradually hardens the metal, the combined carbon and the chill increasing with the addition of manganese. When the manganese is high and the casting large enough to be grey, the fracture is open and coarse, and the graphite scales very large and crystalline. High manganese to a certain extent prevents the absorption of sulphur from coke.

When manganese is below 1.38 per cent. (this percentage is only approximate and depends largely upon the percentage of silicon present ; the lower the silicon, the sooner the manganese will commence hardening the iron) its action is different : it softens the iron, lowers the combined carbon and decreases the chill ; this effect is more marked where the sulphur is high.

Manganese may be used either for decreasing or increasing the chill, depending upon the nature of the mixture and the amount of manganese used. Manganese can be used to advantage in low silicon and chilling iron in the following cases :

First : In mixtures where the per cent. of scrap is large and the sulphur necessarily high, (this will occur in a car wheel mixture, where usually a large portion of old metal is used) the results of this increase in manganese would be a lower sulphur, lower combined carbon, less chill and greater strength.

Second : Very often chilled plates are required, having hard chilled faces and soft backs suitable for planing. Manganese added in the right proportion will reduce the tendency to mottle and make a comparatively soft graphitic back.

In all cases where chilling irons are melted and the sulphur is over 0.07 per cent., the iron can be strengthened by the use of ferro-manganese or pig iron having a high percentage of manganese.

In the manufacture of large hydraulic cylinders the manganese should be kept low, as it is necessary to have a close mottled iron to withstand the pressure and prevent leakage.

Phosphorus has practically no effect upon the grade of iron as determined by fracture. As phosphorus increases the total carbon decreases, and the normal amount of carbon varies from about 3.75 per cent. in normal hematites down to about 3.30 per cent. in normal Cleveland irons containing 4.5 per cent. phosphorus ; that is, with an increase of 1.5 per cent. phosphorus there is an increase of 0.45 per cent. of total carbon. Phosphorus has no effect upon combined carbon, but as the phosphorus increases the iron shows a lighter color, due to the phosphite of iron present.

Usual Composition of Castings.

Castings for machinery and general engineering work vary greatly in composition in different districts, but as a general rule the phosphorus averages about 1 per cent. Manganese usually varies from 0.3 per cent. to 1.5 per cent. but the average is about 0.7 per cent. Silicon may vary from 1.0 per cent. to 3.0 per cent.; but the average is 1.8 per cent. Total carbon varies to a very great extent. In some cases the total carbon is entirely in the form of graphite ; in others the greater part may be combined. It may vary largely in the same casting. Sulphur usually varies from 0.03 per cent. to 0.15 per cent. In special engineering castings where great strength is required, total carbon, manganese, silicon and phosphorus are all low usually.

For castings required to be soft and tough, hematite iron alone is used. Iron for special castings is in some cases remelted once or twice before casting. This is only necessary when a higher grade of iron than is required is being used. Where reasonable care is taken in the weighing of all materials charged into the furnace, the results will be quite as regular without this remelting. The effect of remelting in the cupola is equivalent to lowering the grade. Usually silicon is decreased from 0.2 per cent. to 0.3 per cent. Sulphur is usually increased to the extent of from 0.02 per cent. to 0.04 per cent. About 25 per cent. of the manganese is lost. Total carbon increases or decreases according to the amount present, whether below or above the normal.

Phosphorus.

A very slight amount of phosphorus is absorbed from fuel by iron in melting. It is practically a constant quantity, the small increase being proportionate to the amount of phosphorus in the fuel.

Manganese.

Manganese loses in passing through a cupola. Its action is that of a protector from oxidation, and the amount lost in passing through depends upon the amount of blast and also upon the percentage of sulphur in the fuel. The greater the amount of air forced into the molten metal the more manganese is lost as an oxide. The greater the percentage of sulphur in the fuel the greater will be the percentage of manganese passing into the slag as a sulphide. Manganese is not united with iron as a compound ; it is rather alloyed with it, having practically no affinity for the iron.

Carbon.

Iron may lose or gain carbon in melting. This is governed by the composition of the iron and the conditions or method of melting. An iron while passing down a cupola has a portion of its carbon burnt off, the quantity depending upon the amount of blast and the time which the iron takes to pass through the zone of the cupola where the oxidizing influences are at work. After having a portion of its carbon

† The Dominion Foundry Supply Co.

removed, the molten iron comes into contact with the incandescent coke in the bed, and from this it absorbs carbon. The hotter the iron and the longer it remains in contact with this fuel the more carbon it will absorb. If the amount of fuel is sufficient, the iron may absorb more carbon than it loses in passing the tuyeres. If, however, the blast be heavy, and the ratio of fuel to iron small, the iron will lose more carbon in passing through the oxidizing zone than it can possibly pick up from the bed. Melting with high blast and low percentage of coke will cause a loss of carbon, while low blast and high percentage of coke will cause a gain.

The original composition of the pig iron has much to do with this loss or gain. An iron high in carbon, if melted in a cupola with a small amount of fuel, will lose in carbon; while a pig iron low in carbon, melted in the cupola with a relatively large amount of coke, will gain in carbon. Thus a low carbon tends to gain, a high carbon tends to lose, when melted in a cupola.

It is more correct to say that a low carbon, low silicon iron, will gain in carbon. The action of carbon and of silicon on cast iron are almost identical, although the results are different. Pure iron will absorb carbon up to 6.67 per cent.; it will absorb silicon up to 23 per cent. One part of carbon is then about three and one-half times as effective in cast iron as is one part of silicon. Iron in the melted state may be considered a solution in which carbon and silicon each reduces the power of the iron to dissolve the other. For every rise of 0.1 per cent. in pig iron made under the same conditions, there will be a corresponding decrease of 0.35 per cent. in silicon, and vice versa.

Summing up, a small percentage of fuel, high blast, high carbon and high silicon tend to cause loss of carbon in remelting. A low blast, large percentage of fuel, low carbon and low silicon tend to cause iron to gain carbon in melting.

Prof Turner's Experiments.

In cast iron, graphite for crushing strength should be under 2.0 per cent., for general strength it should be about 2.8 per cent.; for strength and softness it should be about 3.00 per cent.; for softness over 3.10 per cent., when the total carbon is 3.4 per cent.

Combined carbon gives maximum general strength at 0.4 per cent.

Do not dare to live without some clear intention toward which your living shall be bent. Mean to be something with all your might.—Phillips Brooks.

*Iron Melting With Induction Furnace**

By Dr. Richard Moldenke

FOR some time past foundrymen have been interested in the developments of electric smelting so far as it might be applied to their industry. As the necessary information as to whether iron may be melted in a commercial way can only be given by our electrical friends, perhaps a few remarks on the requirements involved may be of use to those who have apparatus and processes adapted for foundry work.

The average foundryman of to-day has constant calls for steel castings along with his regular routine work in grey iron. This, on account of the rapid introduction of the steel casting into machine construction. These steel castings he must sub-let to the steel foundries. The latter are looking for tonnage, and do not like to fill up with small quantities of comparatively light work. Hence high prices, which cut the foundryman's profit. In a similar way the foundryman has to deal with malleable castings. The malleable castings founder has both steel and grey iron put up to him, and it may not lie very far in the future when the steel founder may be asked to produce both grey iron and steel castings along with his steel. It is to be understood, of course, that this is all brought about in making contracts with concerns who place their work by the year, or the thousand tons, be the castings what they may during the period of contract.

Now, very few foundrymen are equipped for this. They strive to place these outside lines with other people at the smallest loss to themselves. Yet if there were a convenient and easily operated process, many of them would install it immediately to take care of just such conditions.

The smelting, or rather plain melting, of iron electrically has always seemed to me ideal in its way. We do not want to produce chemical changes in our mixtures if we can help it. We want only to melt quick, produce very hot iron, and punish the metal as little as we can. Every time we melt the metal under present conditions we hurt it somewhat, the degree of the damage done depending upon a number of conditions, both chemical and physical. We counteract this by additions of steel to reduce the total carbon, or selecting the silicon content in such a way that with the reduction in this element incident to the process, a strong iron results. If, however, we could have a process which in no way changes the composition, we could put into the melt just what we want out of it, and one of the serious difficulties of foundry metallurgy would be solved. Again, if we could regulate the temperature in such a way that the iron is not overheated while melting, but can be heated up very high afterwards, we could obviate the oxidation of the metal during the melt, and in addition remove any existing evil of that kind by the use of ferro-manganese in the melt when it has been brought to practically a steel temperature, at which point the ferro-manganese will do its work.

The induction furnace, it seems to me, fills these requirements, and I would like to see more work done along the line for the foundry. I may be in error, but it would seem to me that scrap of all kinds, properly selected, is all that need be melted, cleaned by some ferro-alloy, and then cast in the usual way. The enormous steel production will always yield scrap enough to supply the demand for small steel castings, once a process of this kind can be made to work commercially, and I would be very glad to be of assistance in bringing a process of this kind to the attention of the foundry world.

Taking the non-ferrous metals. A brass foundry would have abundant use for an electric smelting process, if run on the lines laid out above. The melting loss in the brass foundry in zinc and tin is a great one, and one that runs up into money quickly. A clean, wasteless process, as the electrical one should be, would be a boon to the industry. There are many foundries which could melt within short periods of time during the day or night when their plant is not used for its regular purposes. Hence only the electrical apparatus proper might be required, the necessary power being available.

The foundry has practically every melting process under the sun in use for making the various classes of castings. We see the open-hearth, the Bessemer and the cupola, the air furnace and the crucible in operation everywhere. Yet every metallurgist knows that the crucible process gives the best metal, if you can stand the cost. Now, the electrical furnace, if the melting proper is conducted so that the advantages of the crucible process are retained; that is, the temperature not allowed to exceed safe limits, and the metal kept from oxidizing influences, is bound to give the highest class of product, and it seems to me with the greatest ease of manipulation.

I would therefore urge the study of the line of work in contradistinction to the smelting of steel from ore; in other words, to simply melt, instead of com-

* This article, written by Dr. Richard Moldenke, Watchung, N.J., in Electrochemical and Metallurgical Industry, should be of considerable interest to Canadian foundrymen as a suggestion from a man who has had long experience in foundry affairs.—Editor.

pleting the cycle of operations in a metallurgic process. The great foundry industry is ready to take this up once the commercial feasibility has been demonstrated.

A PORTABLE CORE OVEN.

MANY attempts have been made to design an economical and at the same time efficient portable core oven. Most cores are baked in heavy brick structures which take up an unduly large amount of space, and which cannot be moved or shifted.

Several types of ovens have been put on the market, which are equipped with swinging doors. The objection to all ovens of this type is that there is a lare amount of waste space, due to the difference between the area of the quadrant and the area of a square having sides equal to the radius of the quadrant. One objection to the quadrant or semicircle type of oven is that it is not suitable for drying long cores such as are made on core machines, for the clearance which must be left along the curved edge of the shelf still further reduces the area that can be covered with core plates. The objection to all ovens of the stationary shelf type is that the core plates have to be handled into and out of the oven through openings, which interfere with the draft or heat conditions and thus retard the baking of the cores in the oven.

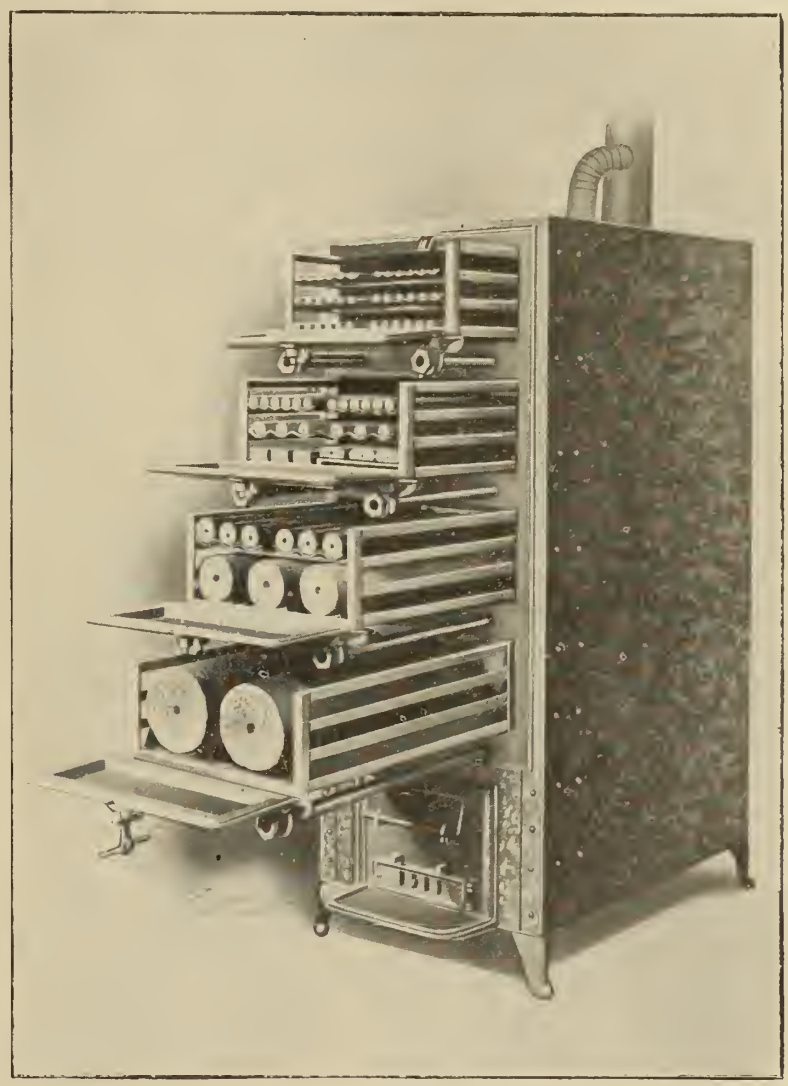
The accompanying illustration is of a new drawer oven, which is self-contained and economical. The one shown is equipped with four drawers, supported by rollers at the back and by pipe guides at the front. The drawers are removed from the oven by slipping a pair of handles into the pipes shown in the front, lifting them slightly and running them forward by means of the wheels on the inside at the back of the shelves, the action being much like that of a wheelbarrow. The shelves are self-sealing, in that when they are drawn forward a plate closes the opening, so that the baking of the cores on the other shelves goes on without interruption. In one of the illustrations the shelves are shown open and drawn to different distances, so as to illustrate the variety of cores which can be baked in an oven at one time. The large cores on the lower shelf are 7 inches in diameter.

This oven was run for an entire day on one bucketful of fine coke or breeze, swept up in the coke bin. The consumption of fuel in an oven of this kind would naturally be less than the other types, as the space is all utilized to the greatest possible extent, there being no ducts or passages in which radiation takes place.

The fact that the fronts of the doors drop down, as shown, enables the core plates to be taken out easily.

These ovens can be distributed about the core department, thus minimizing the distance the core makers have to walk to put their cores in the oven, and a rearrangement of the department can be effected very easily, as the portable oven is no more difficult to move than the core bench.

One point in this oven to which especial attention should be called, is the provision for supplementary shelves dividing the main drawers into divisions.



A New Portable Core Oven.

As shown in the illustration, the two highest drawers are divided into three shelves each, the next into two and the bottom one is arranged without any supplementary shelves. The facility with which these different divisions can be put in will enable the operator to dry any size of cores readily.

This device was designed by George H. Wadsworth, of Cuyahoga Falls, Ohio, who has applied for patent on the same, and it is manufactured by The Falls Rivet & Machine Co., Cuyahoga Falls, Ohio.

NEW FOUNDRY GETTING INTO SHAPE.

When the alterations now being made to the Port Hope radiator factory are complete, the Central Foundry Co., which is to occupy the premises, will have one of the most up-to-date establishments of the kind in Canada. A considerable amount of machinery has already been received. The Corliss engine has been manufactured by Messrs. Geldie & McCulloch, and the cupola blowers by the Sheldon Manufacturing Co., of Galt. The track and steel cars are manufactured by the Atlas Steel Car Co., of Cleveland, O., and the Hammant Steel Car and Engineering Co., of Hamilton. The sand conveyors and mixers are manufactured by the Standard Sand and Machine Co., of Cleveland, O. The electric generators are manufactured by the Canadian General Electric Co., and the pipe mills are being manufactured by the W. W. Sly Co., of Cleveland, O. All patterns and flasks are being manufactured by the firm itself.

The first attempt was by means of a spring chuck in the tapping fixture, Fig.

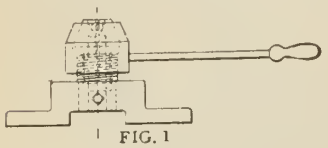

FIG. 1

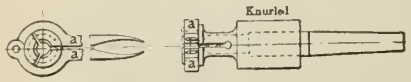

FIG. 2

1, which was used on a vertical-spindle tapping machine. A spring knock-out, not shown, was used for ejecting the nut. This method was very slow, and the chuck gave much trouble by clogging with chips.

As some more productive way became necessary, it was decided to utilize an old Fox lathe for the purpose, and the device in Fig. 2 was made. This is a spring chuck of special shape, provided with a taper shank to fit tail spindle and closed upon the work by means of the hinged handles (a.a.) The tap was made with the shank as long as the lathe would accommodate, the end of the shank milled with three V-shaped to remove, and the necessity of having a good left hand that would not tire with the constant gripping of the handles.

The tail spindle of the lathe was of square section, so that the last fixture was made to clamp upon the end of the spindle. The body of this fixture was of machine steel, and to avoid the labor of sinking a square hole in the end of it, a hole was bored somewhat larger than the diagonal of the square. Next, two pieces of steel were roughly shaped to semi-circular section, and a 90-degree V planed in the flat side, and then clamped onto the spindle and the outside turned to fit the bore of the fixture, which was split and clamped by the screw (a).

The front part of the body was planed away, as shown in the sketch, and fitted with the hinged piece (b) side plates (c.c.), lever (d), and link (e), so that raising the lever would swing up the piece (b) on its hinge pin (f) and open up in front.

After being fitted properly, the whole was placed in its future working position and centred by the tool in the headstock and afterward chucked in the lathe, trued up by this centre, and bored grooves for about an inch and held securely by a turn of the hand in a No. 2 Almond drill chuck in the live spindle, the chuck jaws fitting into the grooves in the tap shank.

After the tail spindle had been relieved of its screw feed so as to slide freely the operation was as follows: With the left hand in position to close chuck, the right hand picks up and inserts a nut and then grips the nurled end of the chuck and pushes ahead until the tap passes through the nut, when the chuck is released and returned to the first position by both hands, the nut remaining on the shank of the tap, after which the right hand is free to begin again. The tapping is continued until the tap shank is full, when the lathe is stopped and the nuts slipped off the shank into the box.

It was this necessity of using both hands for tapping and reversing that caused this method to be abandoned and the fixture, Fig. 3, designed. There were other defects also, such as the chuck filling up with chips, which were not easy by the split bushing (g), also bored out in the rear of the bushing for clearance. The bushing (g) is hardened, and any form of small nut may be tapped in the fixture by making the bushing to suit, the two halves being held in by screws. The side plates are cut away at (h) and the oblong hole (j) is also worked out to allow the chips an easy egress. The stop (k) prevents the link from passing over the centre.

In operation the right hand remains holding the upturned end of lever (d), the lever is raised, a nut inserted by the left hand, the lever pressed down, clamping the nut, and the fixture is pushed ahead by the right hand, which, as soon as the nut is tapped, raises the lever and draws back the fixture for another nut.

The same tap was used with No. 2 and No. 3 fixtures, so that each hand performs a separate function instead of both being required, as with the methods 1 and 2. Another gain is that a handful of nuts may be picked up by the left hand and one selected by thumb and finger ready to insert, while the tapping and reversing is being done by the right. By the previous methods each nut must be picked up singly, dur-

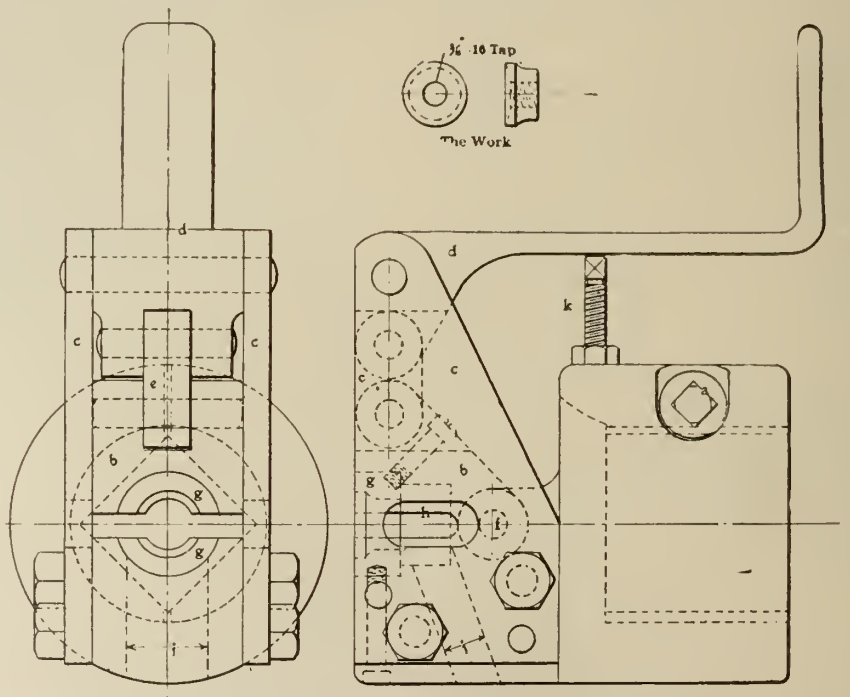

Fig. 3.—The Successful Fixture—The Evolution of a Tapping Operation.

ing which time the machine and other hand were idle.

As the same small boy operated each of these fixtures in turn, his output may be taken to indicate the merit of each method. With the first fixture the best day's work was about 12 gross in 10 hours; with the second, about 20 gross; and with the last one about 43 gross.

The same price obtained with first and second fixtures, while with No. 3 it was reduced 40 per cent. per gross.
—Raymond Grant, in American Machinist.

PILOT WHEEL WITH TELESCOPIC ARMS.

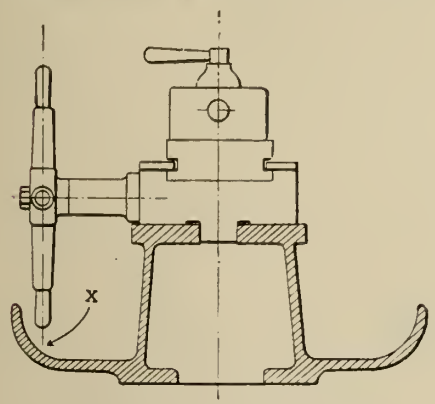
I RECENTLY had a quantity of heavy drilling to do on a hand turret lathe without power feed, and found that if I could have longer arms on the pilot wheel, I could get a better leverage, use high-speed steel drills, and take a pretty heavy cut. On examination I found that, owing to the small space between the end of the arms and the tray (shown at X, Fig. 1), I could not fit longer arms without some alteration.

Of course, I could have overcome this difficulty by extending the pilot-wheel out till the arms cleared the outside of the end tray, but the idea of telescopic arms occurred to me, and I thought they would look better than the long, solid arms, also they would not be so much in the way.

Fig. 1 is a section of the bed, showing the telescopic arms in their normal position.

How They Were Made.

Fig. 2 shows the construction of one arm, all four being made in the same manner. (A) is the hub of the wheel, (b) is a cast-iron sleeve, turned and drilled



SECTION THROUGH BED OF LATHE

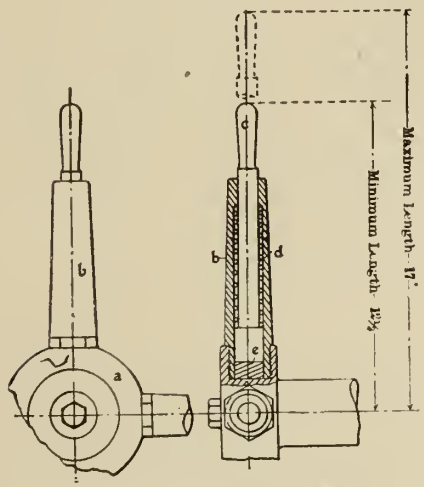
Fig. 1—Pilot Wheel with Telescopic Arms.

to carry the steel arm (c). The spring (d) keeps the arm pulled towards the centre, and is only just strong enough to hold it in against its own weight when hanging vertically downward. The plug (e) is driven in merely to keep the arm in the sleeve when assembling.

It requires very little effort with one hand to lift or pull the arm out, and the pressure put on for drilling keeps it out until released, when, of course, it immediately springs back to original position.—"Conrad," in American Machinist.

NEW METHOD OF MILLING THE FLUTES OF REAMERS.

IN MILLING the flutes of reamers it is customary to mill them so that the cutting edges will not come an equal distance from one another. This prevents chattering and permits the use of an even number of flutes. The difficulties encountered in milling the flutes on unequal distances, or breaking up the flutes as it is commonly termed in the shop, are that if all the grooves are milled to the same depth the remaining land evidently will be wider in the case where the distance from cutting edge to

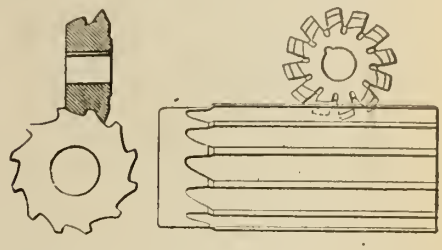


HOW PILOT WHEEL WAS MADE

Fig. 2.

cutting edge is larger than it will be in the case where this distance is smaller. To overcome this it would, of course, be possible to mill the flutes deeper between the cutting edges, which are further apart to insure that the width of the land would be equal in all cases. That this is impracticable when fluting reamers in any large quantities is easily apprehended, as it would necessitate raising or lowering the milling machine table for each flute being cut. In the Zeitschrift fur Werkzeugmaschinen und Werkzeuge, a method is shown employed by the large machine tool firm of Ludwig Loewe & Co., Berlin, Germany. The principle of this method is clearly shown in the accompanying cut. A formed cutter, eccentrically relieved, is employed which, instead of forming only the flutes, forms the actual land of the reamer, thus insuring that every land becomes equally wide with the others. The depth of the flute is determined by the depth of the portion of the cutter in front of the cutting edge of the reamer and it is easily seen that all the flutes will be equally deep.

That this method will be more expensive than the one commonly employed, in which the lands are permitted to become wide or narrow according to the



amount the flutes are broken up, is evident, but it cannot be disputed that the general appearance of the reamer will be greatly improved. The greater expense in making reamers in this manner will depend on two factors. In the first place, the eccentrically relieved cutter will cost more to produce than the ordinary fluting cutter. In the second place, the cutting speed cannot be as high with a cutter of this description as it could be with an ordinary milling cutter. On the other hand, it is possible not only to gain the advantages mentioned above in regard to width of land and depth of flute, but incidentally there is also gained the possibility of giving to the flute a more correct form to answer the requirements of strength as well as ship room, which are often by necessity overlooked on account of the straight sides forming the flutes which are necessary to adopt when using the ordinary straight-sided fluting cutter, with milling cutter teeth of the common shape. While it cannot be expected that this method will be used to any great extent on account of its drawbacks from a commercial point of view, it is ingenious and well worth attention.—Machinery, New York.

DEFECTS OF METRIC SYSTEM.

At a recent banquet of the Empire Club, Toronto, Prof. N. F. Dupuis, of Queen's University, discussed the metric system, and criticized the movement on foot to make the metric system of measurement universal by criticizing the system itself.

It was shown that from the scientific standpoint the metric system was far from perfect. After pointing out that a wide interval existed between the metric and decimal system, the professor showed that the decimal system was adopted accidentally and that it was not the most perfect one which could be devised. In all the figures under 20, only one, 14, would give a worse base than ten. It was immaterial what length should be taken for a unit.

Centrifugal Pumps

By Henry F. Schmidt

ALTHOUGH for years the centrifugal pump has been looked upon as a very inefficient method of pumping large volumes of water at low heads, generally not exceeding twenty-five feet, during the past eight or ten years considerable progress has been

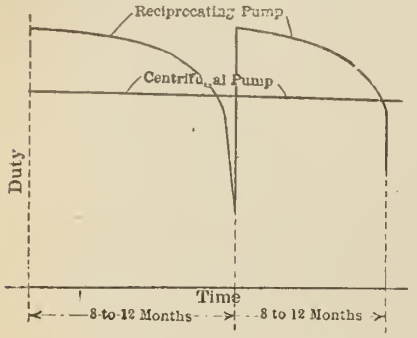


FIG. 1

made in Europe toward increasing the efficiency of this type of pump, at the same time improving the design so as to deal with very much higher heads. The result is that it is now possible under favorable conditions to obtain efficiencies of from 75 to 80 per cent., even at heads of from five to six hundred feet. This result is accomplished by two expedients, the high pressures being obtained by the use of multiple stages, that is, by delivering the discharge from one pump to the suction of the next, and so on, thus adding together the pressures created in the separate pumps; the high efficiency being in a great measure due to the addition of diffusion vanes placed around the impeller in such a manner that part of the kinetic energy imparted to the water by the impeller is converted into the potential or pressure form.

While this work has been going on in Europe for a long period, America has been backward in realizing the possibilities in the development of these pumps, and it is only within the past two or three years that it has received

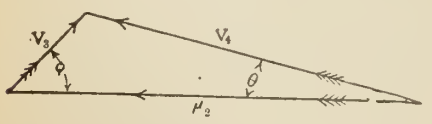

FIG. 2

serious attention for other than low-lift work. Now, however, a number of American manufacturers have placed pumps of this description on the market, albeit with one exception they have followed the designs of the European builders very closely.

In the light of past developments, it is hardly optimistic to predict that within the next few years the turbine centrifugal pump, driven either by a steam turbine or high-speed gas engine, will replace the present type of plunger pump for municipal water works, hydraulic-elevator service, fire pumps, and, in fact, in nearly every service where the volume of water to be handled is large enough so that a high efficiency can be obtained in the centrifugal pump.

Having made this statement, it is proper to submit the reasons why, as follows: First, small cost; second, small space required; third, the efficiency has been found from experience to remain practically constant over years of continuous use; fourth, absence of valves and plungers which need to be packed; fifth, only one moving part and nothing that can get out of order, consequently practically no attendance needed; sixth, almost "fool proof" construction, it being possible to shut the delivery or suction valves completely when pump is running, without injury to the pump or piping, since the pressure can only raise about 10 per cent. under these conditions; seventh, it is practically automatic, because if the pressure on the line decreases slightly,

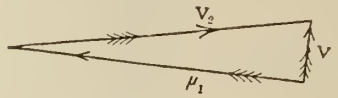

FIG. 3

the volume of water is greatly increased, while if the pressure is slightly increased—showing that the demand is not so great—the volume delivered is reduced, and this entirely independent of pressure-controlling devices or attention from the man in charge; eighth, no more oil is required than for an electric motor of the power required to drive the pump; ninth, practically no depreciation need be charged against a centrifugal pump, where the water is fairly clean, other than that required to rebabbitt the bearings when worn; tenth, steady pressure and flow of water.

The result of these conditions is such that in the case of a centrifugal pump to deliver 1,600 gallons per minute against a 350-foot head for a hydraulic elevator plant, notwithstanding that the duty guaranteed for a three-cylinder compound pump was twice that for a centrifugal pump, when the interest on the investment, oil, valve renewals, etc., were taken into account, the centrifugal pump showed itself superior by a little over two hundred dollars a year. This brings out a point to which I wish to call the attention of anyone who may have to compare the yearly costs of a plunger pump and a centrifugal pump. It is the common custom to figure the annual cost for coal on the assumption that the efficiency of the pump remains constant for the entire year, but this assumption is far from true. In the case of the plunger pump, as the valves begin to wear they begin to leak and do not work as well as at first, the leakage increasing quite rapidly toward the end of the life of the valves, until finally one or more valves give way entirely, and there is a sudden drop in the duty of the pump. This is shown graphically in Fig. 1, in which the curved lines represent the duty of a plunger pump, while the horizontal line nearly parallel

FIG. 4

to the base represents the duty of a centrifugal pump, the efficiency of which remains practically constant. The value of a pump is proportional to the area under this curve, so it is seen from the diagram that the all-round yearly value of the plunger pump is not nearly what it appears to be.

Some will no doubt argue that in a well-cared-for pump this state of affairs would never exist, but this is extremely doubtful, partly because this wear of valves goes on unnoticed until a valve breaks and causes a pound, and partly because the valves are usually rather difficult to get at, and therefore the average engineer will not take the trouble to replace a valve until it becomes absolutely necessary. Furthermore, it must be remembered that in general the man in charge of a plant is only an "average engineer." For this reason I think that in making the yearly estimate of the running costs the plunger pump should be credited with at least 5 to 10 per cent. lower efficiency than is shown on the face of the guarantee.

Owing to the fact that it is very difficult to obtain a cheap and economical steam turbine to run at the speeds required, that is, under 2,000 revolutions per minute, little has been done so far in the driving of centrifugal pumps by this type of motor, except those in which gearing is employed. The reason for this is that the makers of pumps have found that the efficiency of the pump is seriously impaired when a high

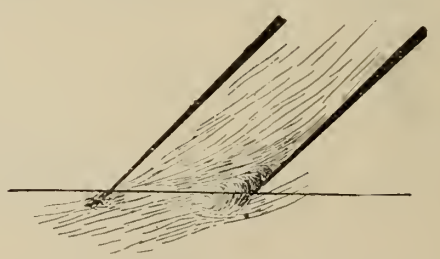

FIG. 5

speed is employed, and it is only within the last year or so that speeds of even 1,800 revolutions per minute have been reached. This drop in the efficiency is found to be caused by an effect similar to what is termed "cavitation" in screw propellers, which refers to the vacuum formed ahead of the screw, due to the water not being able to follow the blades. In pumps, nearly the same thing happens in that the water cannot flow into the impeller fast enough, although in this case it is probably not entirely due to the water not being able to follow the blades, but also due to the blades throwing the water away from them. This is because the water enters the impeller at right angles to the direction of motion, causing shock which has a tendency to pile the water up ahead of the blade and thus throw part of the water away from the blade, instead of causing it to enter.

The velocity diagrams for a centrifugal pump with the blades turned backward are shown in Figs. 2 and 3, in

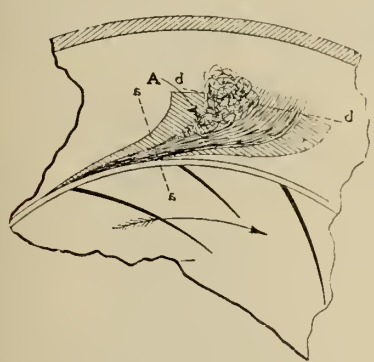

Fig. 7.

which μ_1 is the velocity of the inside of the impeller, V is the intake velocity which is at right angles to μ_1 and V_2 is the velocity of the water relative to the blade. Fig. 2 is the diagram for the exit, μ_2 being the velocity of the circumference of the impeller, V_3 the velocity of the water relative to the frame of the machine. In Fig. 5 is shown the effect which was spoken of above, namely, the piling action due to the water not entering tangentially to the blade.

From this, the writer wishes to make a rather novel suggestion: that of placing guide blades inside of the impeller, as shown diagrammatically in Fig. 6. The object of this will be quite clear from what has already been said. The action of these internal guides is shown in Fig. 4. Here, instead of the water entering the impeller at right angles to the direction of motion, it enters with a greater velocity and at an angle, as shown by V_1. Consequently, the velocity V_2 is made much smaller and the angle between it and μ_1 is made greater, so that it is possible by proper design to have the water enter the impeller nearly if not quite tangentially.

The final result of this is that the speed of the inside of the impeller may be increased considerably, thus permitting much higher speed of rotation to be adopted, and still obtain the same efficiency, if not a higher efficiency, for reasons which will presently be given. The velocity which it is possible to give V_1 will probably be from thirty-five to forty feet per second, which means that the blade velocity may be increased a similar amount, although of course it is needless to say that the lifting power of the pump would be reduced and it would therefore be necessary to place the pump lower, so that the water would nearly run into it by gravity, but this would be objectionable only in comparatively rare cases.

If the water can be made to enter the pump, higher speeds of rotation are advantageous to economy, for, with a given head, the diameter of the impellers may be made smaller, which means smaller rotation losses due to the friction of the water on the disks of the impellers. The power thus lost varies as the cube of the number of revolutions per minute, and the fifth power of the diameter of the impeller, or, very nearly by the formula,

$$HP = \left(\frac{N}{100}\right)^3 \frac{D^5}{1000}$$

in which N is the number of revolutions per minute, and D is the diameter in feet. Consequently, if the number of revolutions is increased and the diameter is decreased, the power lost in rotating the impellers is reduced, and furthermore, which amounts to the same as increased efficiency, the cost is reduced, since the higher the number of revolutions, the smaller the pump, and less interest chargeable against the installation.

Lower cost of construction brings up wishes to make. Instead of casting the impellers and blades in one piece, and finishing the surface by hand, the writer proposes making the blades out of sheet steel or bronze and bending them to propore shape on a form, then finishing them on an emery wheel, after which they are set in a mold and cast into the impeller disks and hub when the molten metal is run in the mold. In this way, the cost of finishing the im- which in the end is equal to a gain in efficiency. The diffusion vanes can be made in a similar manner and cast with the casing, and as two sides of the channel formed are polished, the sides would not need to be finished, which of course, also applies to the impeller.

Fig. 7 shows the usual form of diffusion vane employed in turbine pumps, and the writer wishes to criticize this form of diffusion vane for not following the natural stream lines of the water as it leaves the impeller. It is evident that the water leaving the impeller would naturally tend to flow in nearly straight lines, and hence in the form of vane shown in Fig. 7, there would be a decided tendency to form eddies at A, which would materially reduce the effective area of the passage at (b b). Now, the area at (a a) should be to the area at (b b) inversely as the velocities at those points, in order that the velocity of the water may be reduced from the high rate at which it leaves the impeller to that allowable in the passages, and thereby the kinetic energy converted into potential energy. If, however, part of the area at (b) is ineffective, the reduction in velocity will not be so great, or, rather, though the velocity is reduced, the kinetic energy which it represents is only partially converted into potential energy, the remainder being lost in eddies. Of course, there will always be a certain loss from ed-

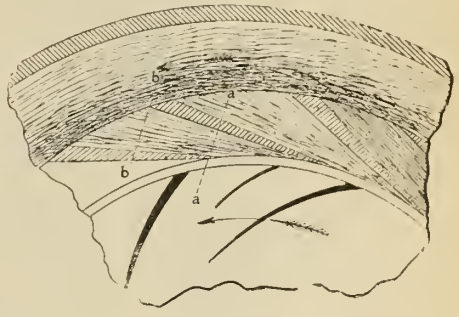

Fig. 8.

dies, but the sharp turn at (A) will tend to increase it greatly.

To avoid this, the writer proposed the form shown in Fig. 8, in which the water can more nearly follow its natural course, and which presents no sharp turns which are bound to form eddies. Another point in this connection is the number of diffusion vanes provided. In most commercial pumps now in the market the number of vanes is from six to twelve, which if applied to an impeller of large diameter makes the passage too wide, and this is also conducive to losses by eddies. If the construction of Fig. 8 were employed, and the blades formed and cast in the mold, it would be a very simple matter to increase greatly the number of vanes, although of course the opposite extreme must not be approached, since then there would be too great a friction loss.

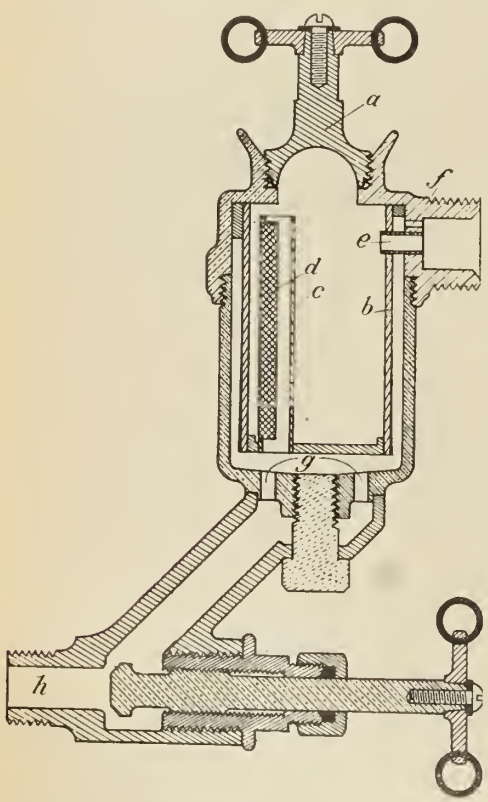
The reason for the reduced chances for eddies when the passages are narrow is easily seen by approaching the limit when the space between the walls would be so small that a molecule could just pass through them without a chance for side movement.—Power.

Power and Transmission

Steam *Gas* *Electricity* *Compressed Air* *Water*

THE GRAPHOIL LUBRICATING ATTACHMENT.

FOR very many purposes there is no better lublicating agent than graphite in combination with oil to act as a carrier. Although this is well known the difficulties attending the satisfactory use of the combination have limited its practical adoption. These are due to its specific gravity being greater than that of the most viscous oil. As a result no mixture of graphite and oil can be made to be used as a lubricating compound, since the graphite persists in precipitating, defeating the maintaining of a uniform mixture. Either the materials must be continually agitated, or the oil must be fed in such a way as to take up a percentage of graphite, the two being brought together as near as possible to the surface that is to be lubricated, so that the graphite will be continuously carried to these surfaces and the mixture allowed at no time to come to rest long enough for the graphite to separate from the oil. The latter is the principle employed in the Graphoil lubricating specialties, manufactured by the Comstock Engine Company, Brooklyn, N.Y., one of which is herewith illustrated.



The Graphoil Lubricating Attachment.

This consists of a graphite cup, a sectional view being shown. This cup is attached to the cylinder lubricator in such a way that oil and graphite are introduced into the steam pipe, and from thence to the steam chest in the same way as the oil alone in ordinary sight lubricators.

The construction of the cup, as can be seen from the illustration, consists of an inner and an outer cup separated by a steam space, which serves to equalize the pressure in and around the inner cup (b), and also serves to prevent condensation in the latter. Inside the inner cup is an upright brass tube (c) open at the top and bottom, and cut away on one side, where it is covered with wire cloth (d). The graphite is placed in the inner cup (b) after removing the filler plug (a), and rests in a compact mass around the tube (c), with its upper surface exposed.

When the Graphoil cup is connected with an oil lubricator the oil flows into the inner cup, passes over the surface of the graphite, taking up some of it, then goes through the meshes of the wire screen (d) and down the tube (c) to the bottom of the outer cup. From there it drains through the holes (g) into the passage leading to the outlet (h). Each drop of oil fed contains the right proportion of graphite, generally 1½ per cent., Dixon's No. 2 flake graphite being the grade preferred.

The attachment is constructed entirely of brass, the exterior parts being castings, the brass cup (b) a piece of seamless tubing closed at one end with a header, and the small tube (c), also of brass, cut away, as before mentioned, and covered with brass gauze of 24 mesh, No. 30 wire. At (f) are three holes surrounding the oil inlet (e), the purpose of which is to connect the space surrounding the inner cup with the cavity where the oil enters, to balance the pressure so that the oil will flow by gravity.

It is claimed for the Graphoil cup that it will save from 25 to 60 per cent. in cylinder oil. A direct consequence is a less amount of oil in the steam, which is of advantage when the steam is condensed and returned to the boilers, as it reduces the oil in the boiler feed. Further claims are that it will protect the packing and prolong its life, decrease the friction, reduce wear on the engine and increase the effective horsepower. As has been already shown, it is simple in construction and has no mechanism to get out of order. It cannot feed too much graphite. When desired the cup may be used with no graphite in it, so that oil alone is delivered through the cup. The cups are particularly adapted for use on air compressors, cylinders of locomotives, multiple oiler systems, eccentric troughs, wipers, etc. Their use on high or low speed steam engines, where the movement is irregular or not continuous, as on blower engines, elevator or steam pumps, etc., insures thoroughly efficient lubrication at a greatly reduced cost, and effectively prevents the groaning and laboring peculiar to engines doing service under such conditions.

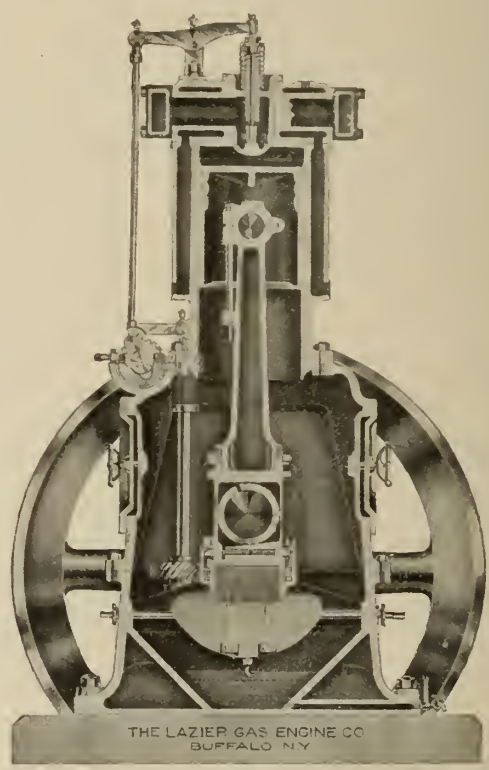


Fig. 1—Lazier Gas Engine.

Someone asked Thomas A. Edison, "Don't you believe that genius is inspiration?" "No," he replied; "genius is perspiration."

NEW TYPE OF GAS ENGINE.

THE accompanying illustration is of a new type of gas engine, designed by Arthur H. Lazier, and built by the Lazier Gas Engine Co., Buffalo.

Quite a number of new ideas have been incorporated in this engine, which makes it of considerable interest. The valves are operated mechanically. A

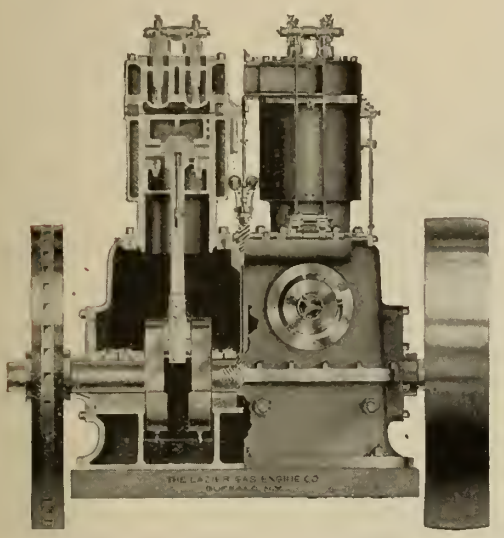

Fig. 2—Two Cylinder Lazier Gas Engine.

double system of ignition, which can be run either separately or in combination, has been provided, and it is so arranged that the time of firing can be changed while the engine is in operation. Another feature of the engine is the running of cams and the cam shaft in oil. The system of operating the cam shaft is also new, there being but four gears in the entire machine. These gears are spiral and run in oil, which makes their operation almost noiseless. The method of taking up lost motion in the connecting rod is shown in the cross section view of the engine. The "splash" system of lubrication is used in the engine.

This engine, it is claimed by the makers, can be arranged to operate on almost any kind of fuel, including alcohol, kerosene, distillate, illuminating gas or producer gas.

This engine is made in sizes from 200 to 300 h.p., and owing to its simplicity of parts the makers claim to be able to build it at a comparatively low cost.

PNEUMATIC REVERSIBLE DRILL.

THE accompanying illustration is of a reversible pneumatic drill made by the Independent Pneumatic Tool Co., Chicago. The operation of these drills is clearly shown in the illustration. The motive power is of the 4-cylinder reciprocating piston type, the pistons being connected to an opposed crankshaft. The drills are equipped with the Corliss valve motion, which allows the live air to be magazined and controlled up to within $\frac{3}{8}$ of an inch from the cylinder; this air when released quickly, acts on the piston instantaneously. This construction allows no air to pass through except what is absolutely needed; and thus economy of operation is effected.

All joints in the case have been dispensed with, excepting one between the gear case and the cylinder, thereby simplifying construction, assisting in keeping the working parts in line, and preventing leakage. The telescopic feed with which this drill is equipped is one of its particular features, since it gives a very large range.

In drills requiring great power, compound gearing is employed, thus insuring the required power with slow speed.

SHRINKAGE AND CONTRACTION.

By Ernest C. Morehead.

THERE are but few founders who recognize the distinction between shrinkage and contraction, but consider it one and the same thing. However, some distinction is necessary.

The actions of shrinkage and contraction are distinct in their nature and are divided by a slight expansion which takes places at the moment of solidification.

Shrinkage is the decrease in volume of the liquid metal until it becomes solid, at which time comes the action of expansion, but this expansion is not as great as the previous shrinkage and is rarely noticed.

After this expansion the casting again decreases in size and continues to do so until it reaches the temperature of the air. This is known as contraction. Thus, they are two separate actions and should be recognized by distinctive terms.

Feeding of the mold is still another important operation which is not given due consideration. For instance, step inside the foundry and you will see a molder using a feed-head that will solidify almost as soon as the casting is poured, although the casting itself will remain in a fluid state some minutes after the head is permanently set.

You may pass to still another molder whom you will see insert a cold $\frac{3}{4}$-inch feeding-rod in a 2-inch head and very often the rod, which has a chilling effect, will draw iron from the casting rather than aid in feeding. Many cases of this kind could be cited that are every-day occurrences in most every foundry, but let us pass and get down to the proper feeding of the mold.

In feeders 2 inches in diameter a rod should not be used more than $\frac{3}{8}$-inch in diameter.

For heads 4 inches to 6 inches, use $\frac{5}{8}$ to $\frac{3}{4}$-inch rods and for feeders above 6 inches, rods $\frac{3}{4}$ to 1-inch can be used.

All feeding-rods should be well heated in a ladle of hot metal before being introduced in the feeding-head. The iron in the feeding-head is usually dull, an account of its having flowed from the bottom of the mold to fill the feeders, so the feeding-rod should pass through the casting to a depth that would insure hot iron being fed to the part that is going to shrink. Where feeding-rods are used plenty of hot iron should be on hand to keep the feeder open. Molders disregard this important point and frequently you see them chilling the head with water rather than feeding it with hot iron.—Obermayer Bulletin.

Metal Working **Special Apparatus** **Wood Working**

OWEN PLAIN MILLING MACHINE.

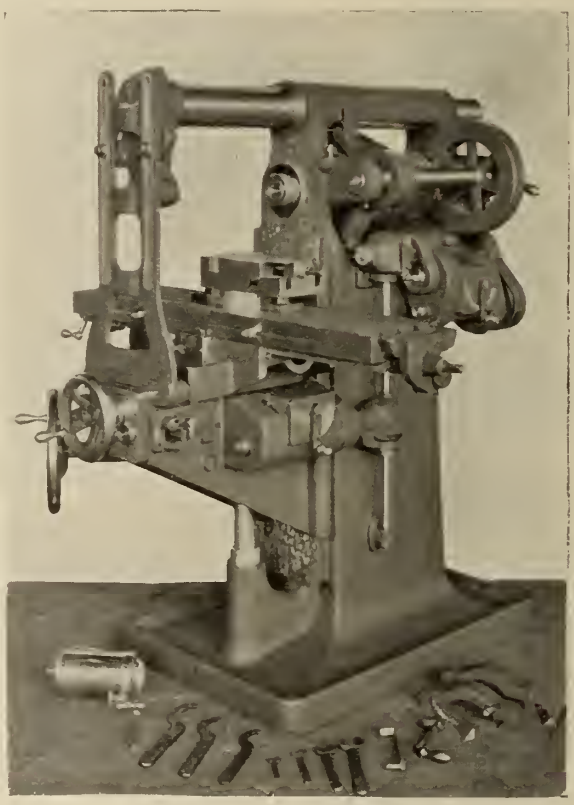
THE Owen Machine Tool Co., Springfield, Ohio, have recently remodelled their plain milling machine. Two sizes of this new line, known as No. 2B and No. 3B, have been placed on the market, and the accompanying illustration shows the No. 2B.

As may be seen from the illustration, special attention has been paid to stiffness and rigidity in the improved design. The machine has a geared key, no chain being used between the spindle and the feed screw, as in the former designs.

The feed changes, of which there are thirty-two, may be obtained while the machine is in motion without the slightest injury to the working parts, the handles for controlling these changes are always in easy reach of the operator, and the feeds are automatic in all directions. The usual telescopic drive is eliminated, being replaced by vertical and horizontal shafts and sliding bevel gears.

The table has a double bearing, being fitted both above and below the dovetai,ed slide. This tends to keep it in good alignment even when working at the extreme of its motion, at the same time preventing it from cramping, and thus allowing it to work freely. All the gearing throughout the machine is of steel. The spindle is of crucible steel, running in phosphor bronze boxes provided with means of compensation for wear. The back gears are single in the machine shown, and double in the No. 3B size, giving respectively 12 and 18 changes of speed with three-step cone and two-speed countershaft. The overhanging arm is of solid steel, carrying an arbor support lined with a bronze bushing.

For the No. 2B machine shown in the cut, the longitudinal movement is 28 inches; cross feed, 7½ inches; vertical feed, 19½ inches. The largest diameter of the cone is 11⅞ inches and it has four steps for a 3-inch belt. The spindle is bored for a No. 10 B. & S. taper. The net weight of the machine is 2,850 pounds. The dimensions for the No. 3B machine are as follows: Longitudinal movement, 38 inches; transverse movement, 11 inches; vertical movement, 20¾ inches. The largest diameter of the cone is 12 7-16 inches for a 3½-inch belt. The spindle is bored for a No. 11 B. & S. taper. The net weight of the machine is 4,300 pounds.



Owen Plain Milling Machine.

A THREE BAR BORING TOOL.

A THREE-BAR boring tool, as shown in Fig. 1, has just been placed on the market by Armstrong Bros. Tool Co., Chicago. As shown in the illustration it is a combination of post and holder, which is made of bar steel. The holder has a T-head fitted in the tool post slot, by which it is clamped by the nut at top,

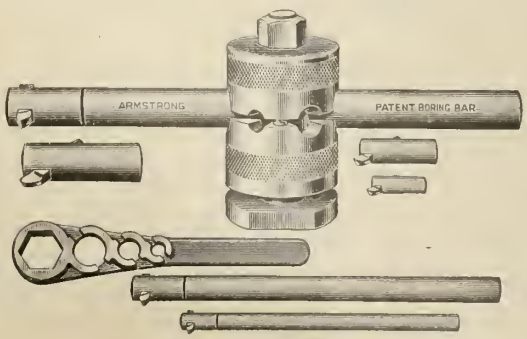


Fig. 1.—Three Bar Boring Tool.

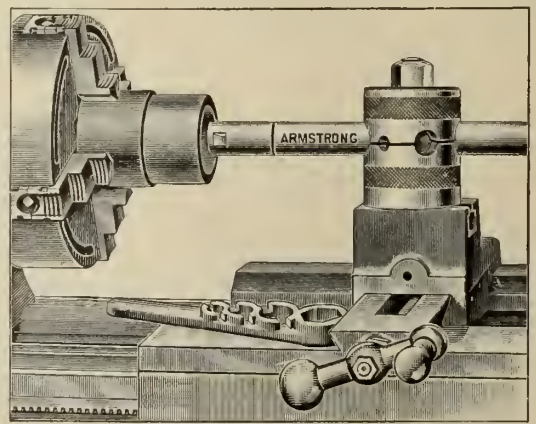

Fig. 2—Three Bar Boring Tool.

which also serves to clamp the bars in place. As indicated by the name, there are three bars of different diameters. The fact that but a single turn of the wrench is necessary to release both the bar and the holder facilitates the quick changing of bars, thus allowing the operator to use the bar most suitable for his work with very little time lost in changing. The wrench shown has one opening for the nut and one each for tightening the cutters in the three sizes of bars furnished with the tool. The tightening of these cutters is affected in such a way that the pressure of the cut tends to hold them firmly in position. Fig 2 illustrates this tool in position on a lathe bed.

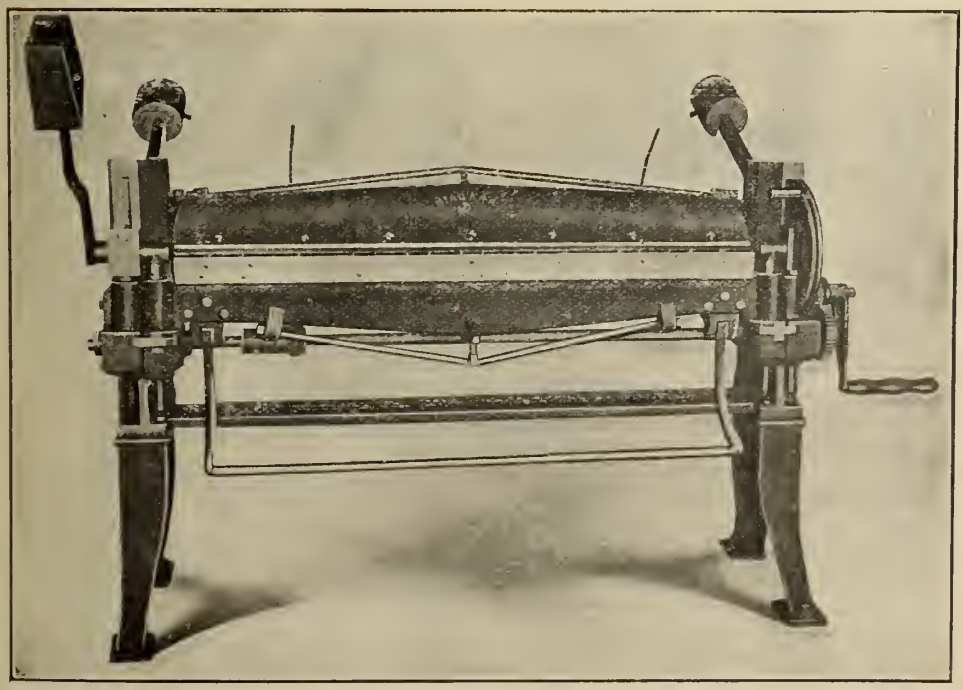
COMBINED BRAKE AND FOLDER.

A COMBINED brake and folder has recently been placed on the market by the Niagara Machine & Tool Works, Buffalo, which is shown in the accompanying illustration. Several new features are incorporated in this machine, the chief of which is its suitability for making curved forms, the bars being self-adjusting for such work. Another feature of the folder is that it enables the operator to turn close locks. The working length of this machine is 52 inches, and has a capacity for No. 18 iron and lighter.

The self-adjusting feature may be enlarged upon. By means of this feature curves, ogees, etc., can be formed with ease and neatness without adjusting the upper and lower planting bars independently.

These bars adjust themselves to the proper position in relation to the pivots of the bending bar for the bend to be made at the same time that they are moved apart the proper distance, regardless of whether a sharp lock is to be turned around the edge of the upper clamping bar or the sheet is to be bent around inserted semi-circular forms. The benefits are a saving of time and trouble and a certainty of obtaining good and uniform work. If required, the upper bar can be disconnected and raised independently. The upper and lower clamping bars will open up to 4 inches.

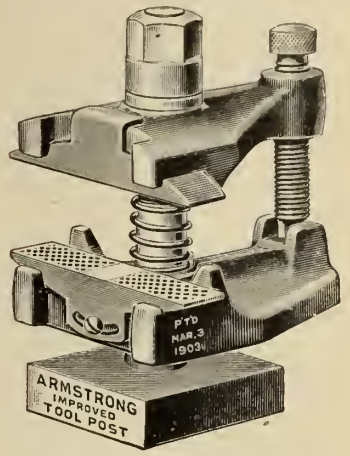
The following attachments are furnished with the machine: A steel blade with a sharp edge at an angle of 40 degrees to be used for cornice work, another with an edge having an angle of 20 degrees, for folding hooks for lock seams on iron up to 20 gauge and a wooden semi-circular form of ¾-inch radius. Back gauges are provided for bends up to 26 inches wide and two adjustable pointer gauges, used to indicate the proper position of the sheet according to prick marks in forming curved members. These gauges can be removed when not wanted. There is an angle stop on the right side to limit the motion of the bending bar in case a number of bends are to be made at the same angle. A blade is fastened in front of the bending bar to straighten it for ordinary work. This blade can be removed in making narrow bends. The back gauge is fastened to the lower clamping bar, and if it should be in the way can readily be removed. If desired a front gauge can be attached to the bending bar.



Combined Brake and Folder.

AN IMPROVED TOOL POST.

AN improved style of tool post, shown in the accompanying illustration, has just been placed on the market by Armstrong Bros. Tool Co., Chicago. This tool post combines in itself the strength and holding power of the strap and stud tool clamp, with the convenience of the open slide and ordinary set screw tool posts.



Improved Tool Post.

This tool post is made of drop forge steel throughout, and, as shown in the illustration, consists of a pair of jaws carrying tilting, clamping faces; these jaws are pressed apart by a spring and may be clamped together by the T-head bolt which passes through them and into the slot of the tool block. An adjustable screw furnishes the back support for the clamping action.

It is claimed for this tool post that it is stronger and stiffer than the ordinary type, will not slip or allow the tool to chatter, and will consequently do more work. It will work up close to the chuck, and has a great range of adjustment. The open side permits a rapid change and adjustment for tools. It will not cut or tear the tool shank and is thus especially adapted for use with tool holders. By using V-blocks fitted to this tool post, boring bars of various diameters can be conveniently held.

THE ROAD TO SUCCESS.

A young man who really and earnestly desires to succeed should never waste any time in dissipation, not even in so-called harmless dissipation.

He should, of course, allow himself the necessary amount of recreation and rest, and he should try to live a healthy, regular life.

He should try to acquire regular habits; that is, sleep and eat at the same hours every day and night, so as to keep in perfect physical health.

Then he should make it a rule every week to put by a certain amount of his earnings and acquire the habit of saving.

A NEW FRICTION CLUTCH.

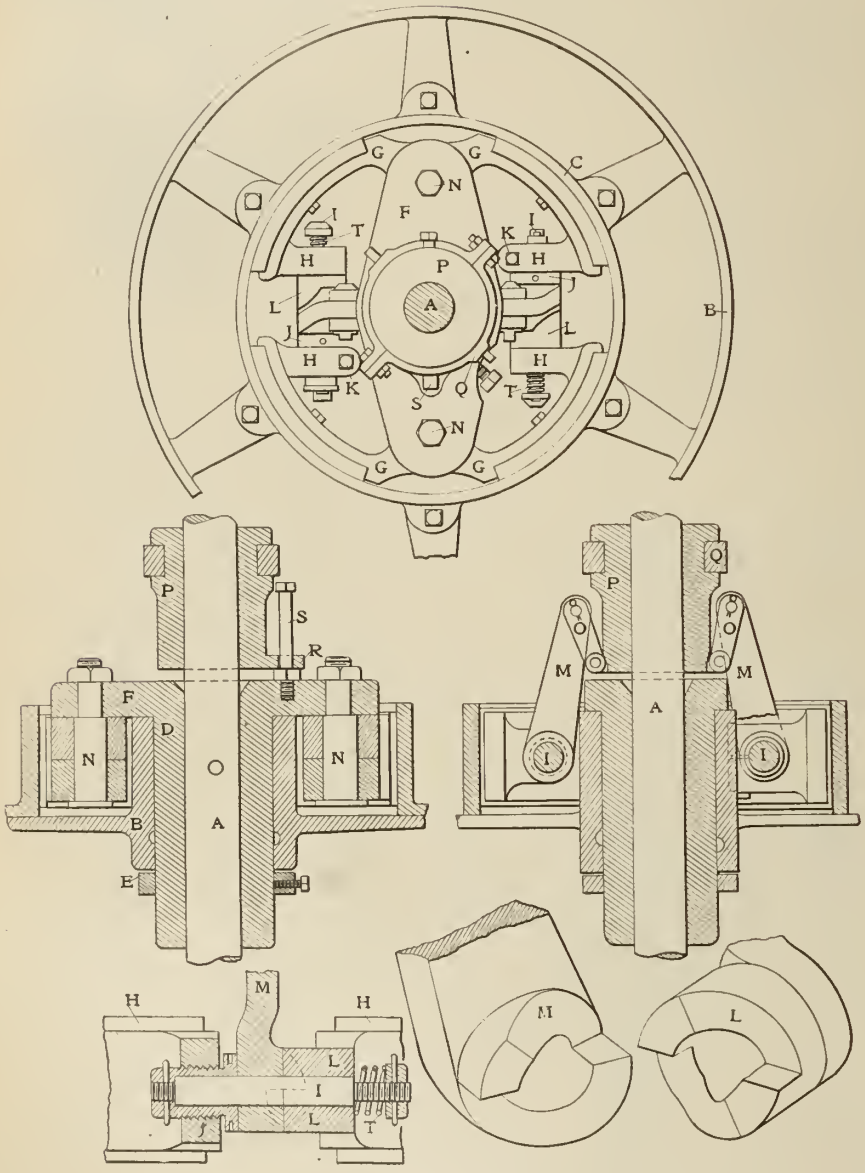
THE accompanying illustration is of a new friction clutch which has been patented and is being manufactured by John Rieppel, Cowanesque, Pa.

(A) is the shaft, (B) is the pulley, to the arms of which the friction ring (C) is bolted. (D) is a sleeve secured to (A), upon it the hub of the pulley (B) is journaled. A collar (E) at one end prevents the pulley moving end-ways in that direction, while a flange (F) on the other end of (D) prevents it moving in the opposite direction. The lugs of (F) have a pair of clutch shoes (G) pivotally bolted to each of them by the bolts (N). The clutch shoes (G) are lagged with suitable frictional material, such as wood.

The ends of the clutch shoes (G) furthest from the pivots (N) are provided with angular projections (H), through these projections are holes for the bolts (I). Two of these angular ends (H) are threaded to receive the threaded sleeves (J) which are provided with a flange and pilot holes for adjusting them in or out of (H). These two members (H) are also split and the two bolts (K) passing through them at right angles to these splits are used to clamp the sleeves (J) when their adjustment is correct. The other two members (H) are provided with cam faces (L) which fit similar faces on the two levers (M). The other ends of the levers (M) are pivoted to the ends of the link (O), the other ends of which are pivoted to the sliding collar (P) which is movable longitudinally on the shaft (A). The collar (P) is provided with a groove in which works the split ring (Q) having trunnions by which it is connected to a shifter lever (not shown).

The collar (P) has a lug (R) on one side of it, through which is a clearance hole to receive the bolt (S) screwed into (F). The object of (S) is to limit the movement of the collar (P) on the shaft (A). In practice the shoes are normally out of frictioual engagement with the ring (C) on the pulley (B).

When it is desired to throw the clutch into engagement, the collar (P) is moved away from (F), this forces the links (O) up at right angles with the shaft, which operation turns the levers (M) on their bearings on the pins (I). The cam faces (L) and (M), swing the clutch shoes (G), on the bolts (N), and force them into frictional contact with the inner surface of the friction ring (C). Throwing the collar (P) in the opposite direction releases the clutch shoes (G), the springs (T) then draw the clutch shoes back out of contact with the friction ring (C).



A New Style of Clutch.

STANDARD ENGINE DESIGN.

THE design of reciprocating steam engines can now be safely said to have reached a stage of more or less standardization. The proportions of the various details to give the best results under giveu working conditions can be found in any staudard work on the snbject. This standardization can be accounted for, not only by the number of years which the reciprocating eugine has been a standard article of manufacture, but perhaps more from the fact that the reciprocating steam engine, as an engine, is not patented, and consequently designers from all parts of the world have been devoting their energies to arrive at the solutiou fotse b'' ergies to arrive at the solution of ''best practice.'' Had the developmeut of this class of machinery, however, been in the hauds of one man or one firm only, not matter how clever they might have been, it is too much to expect that they could have attained the same degree of perfection that now xists. Designers differ largely in their views, and it is only by the failures and successes of the schemes of these various engineers that we have been able to deduce standard formulae for the proportions of the respective parts of steam engines.

W. J. A. LONDON.

LUBRICATING GAS ENGINE CYLINDERS.

A method of lubricating the cylinders of gas engines is given in ''Graphite'' and depends on the finishing cut on the piston. This is made with a diamond-pointed tool with slow feed enough to produce very fine lines on the surface of the piston or what might be called a finely corrugated surface. This is filled with graphite, with the result that it faces up smooth with the two materials in contact with the surface, a small amount is required to properly lubricate the cylinder and make up the small amount that is constantly being carried oat of it.

BOOK REVIEWS

BUILDING MECHANICS' READY REFERENCE.—A carpenters' and woodworkers' edition, by H. D. Ritchey, Superintendent of Construction U. S. Public Buildings, 119 illustrations, 226 pages, price $1.50 net, New York, John Wiley & Sons.

This book is intended as a ready reference manual for the use of the carpenter and wood worker. It is not filled with complicated formula or diagrams, but the entire matter made plain and simply stated, appealing directly to the man for whom it is intended.

THINGS THAT ARE USUALLY WRONG. — By John E. Sweep: 52 pages, illustrated, with drawings and diagrams. New York: Hill Publishing Co. In the preface, the author when stating that the book would be useful to mechanical and engineering students, machine designers and inventors, states that should those who buy the books be disappointed they can console themselves with the fact that it did not cost much. A few, however, will be disappointed with this volume as it contains some first-class kinks, and any mechanical man desirous of improving himself and his methods can peruse this little volume with considerable interest and profit.

MODERN MILLING MACHINES. Their design, construction and working. A handbook for practical men and engineering students, by Joseph G. Horner. 269 illustrations, 300 pages; price $4; New York: Norman W. Henley Publishing Co., 132 Nassau street.

So important has the milling machine become in metal work manufacture of late years that a book on the subject is very opportune. The author is well known in connection with various mechanical subjects, which he treats in a thoroughly practical manner from the view point of years of experience. Milling machines have become highly specialized, and the work of milling is now subdivided into different groups, just as that of turning is, ranging from very plain to very difficult work. The opening chapter deals with the leading elements of milling machine design and construction, followed by a chapter on plain and universal machines. This leads us to special attachments and special machines, after which a chapter is devoted to cutters, an important feature of the milling machine practice. The remaining chapters deal with various milling operations, showing the scope of the milling machine in modern practice. The book is well written, is clear and practical, and can be recommended to mechanics and superintendents in search of fuller information regarding milling machine practice.

MODERN PLUMBING ILLUSTRATED, by R. M. Starbuck. 384 large quarto pages, with 55 full-page and detailed engravings. A standard work for plumbers, architects, builders, property owners, and boards of health and plumbing examiners. Price $4; New York: The Norman W. Henley Publishing Co.

This book is an outgrowth of, and an improvement upon, the author's series of fifty blue print charts known as "Modern Plumbing Illustrated." The present volume deals with high-grade modern plumbing, showing detail work and complete plumbing systems. Each one of the 55 plates is accompanied by several pages of descriptive matter, in some instances as many as eight or ten, the text forming a critical and concise treatment to each phase of the work under discussion. While the book is somewhat ambitious in its scope, it covers well what it sets out to accomplish, and should prove invaluable to all interested in the most approved methods of plumbing construction, drainage and ventilation of dwelling apartments and public buildiigs.

ABOUT GAS ENGINES.—We have before us a volume entitled, "Questions and Answers from the Gas Engine," published by the Gas Engine Publishing Co., of Cincinnati, Ohio. This book has been compiled from the "Answers to Inquiries" column of "the Gas Engine," and consists of the more interesting and valuable inquiries which have appeared in that journal for the past eight years. The inquiries relate to the design, construction, operation and repair of gas and gasoline engines, for stationary, marine and automobile use, and the answers were made by some of the best recognized authorities on the various subjects, in America and Europe.

This volume measures about 5 x 7 inches, and contains about 275 pages and should prove of value to any who are interested in gas engine construction or repairing.

PERSONAL MENTION.

Louis Boissinot, of Dorval & Boissinot, machinists, Montreal, is dead.

Mr. A. D. Bayne, manager of the Canadian Westinghouse Co., Hamilton, has left for Europe.

Mr. Clarence Bullis, of Minneapolis, has arrived in Regina to accept the management of the Saskatchewan Automobile and Gasoline Engine Company.

Mr. J. H. Dohner, for a number of years with the National Cash Register Co., has accepted a position as assistant general superintendent with the National-Acme Manufacturing Co.

Mr. W. G. Rogers, secretary-treasurer of the Erie Iron Works, St. Thomas, has disposed of his interest in the company to Mr. G. F. Spackman, who recently purchased Mr. J. Risdon's stock in the company.

Mr. J. D. Sullivan, superintendent of Mackenzie & Mann's Halifax & Southwestern Railway, dropped dead of heart trouble on April 11th. He was about 35 years old, and was formerly in the C.P.R. service in Ontario.

Mr. K. L. Aitken, consulting engineer, of Toronto, presented for discussion a paper entitled "Synchronous Converters vs. Motor Generator Sets," by Mr. Paul M. Lincoln, at the April meeting of the Toronto branch of the American Institute of Electrical Engineers.

Mr. R. J. Sutton, late of the Labatt Mfg. Co., London, Ont., has returned to the United States, and is now located at 73 Eppirt street, East Orange, N.J. He intends to make a specialty of introducing the premium plan of paying for labor in machine and other shops.

Thos. Moore, sales manager of the Belleville Rolling Mills, was in Toronto a few weeks ago. He reports the demand for their horseshoes so great that the company has been compelled to take two of its travelers off the road and to double the milling capacity. The company is also installing bolt and nut machinery.

Mr. Wilfred H. Parmelee, who for the past year and a half has conducted a manufacturers' agency in Toronto, has lately associated with him Mr. R. E. Nicholson, and the business will hereafter be conducted under the name of Parmelee & Nicholson, with offices at 1314 Traders' Bank building, Toronto. Mr. Nicholson was with Wood, Vallance & Co. for about three years, having previously been connected with Rice Lewis & Co., while Mr. Parmelee was for five years manager for W. R. Perrin & Co., Ltd., and the present joining of forces should make a strong combination. Among the manufacturers already represented by the firm are the Laurie Engine & Machine Co., Ltd., Montreal, makers of engines, heaters and power presses; the Canadian Boomer & Boschert Press Co., Ltd., Montreal, hydraulic knuckle-joint presses; P. E. Shantz, Preston, trucks; the Bourne, Fuller Co., Cleveland, bar iron, steel, etc.; Glaholm & Robson, Sunderland, England, wire rope; J. D. McArthur & Co., Brockville, leather belting; Burleigh & Weeks, Whitehall, N.Y., moulding sand; McKeefrey & Co., Leetonia Ohio, coke. In addition to acting as agents for the above, the firm is a direct importer of English fullers' earth.

ABOUT CATALOGUES

By mentioning Canadian Machinery to show that you are in the trade, a copy of any of these catalogues will be sent by the firm whose address is given.

THE CHATHAM MOTOR CAR CO. issues a neat booklet descriptive of the Chatham Motor Car, manufactured by the company.

MARINE ENGINES. — Fairbanks-Morse marine engines are dealt with in a catalogue recently issued by the Canadian Fairbanks Co., Limited.

"SOMETHING ELECTRICAL FOR EVERYBODY" is the title of catalogue twenty-two of the Manhattan Electrical Supply Co., New York.

SILICON ALLOY.—"Outerbridge" silicon alloy, for softening, strengthening and cleaning cast iron, is the subject dealt with in bulletin No. 16 of the J. W. Paxson Co., Philadelphia.

A CATALOGUE AND PRICE LIST of Armstrong tool holders and other machine shop specialties, in compact pocket form, is No. 14, issued by the Armstrong Bros. Tool Co., Chicago.

STORAGE BATTERIES FOR STATIONARY SERVICE, manufactured by the Westinghouse Machine Co., East Pittsburg, Pa., are dealt with in Catalogue S., recently issued by the company.

THE TORONTO POTTERY CO. issues a neat and comprehensive catalogue of high grade fire brick. Several interesting and valuable tables are included in the booklet, which is nicely printed and of handy size.

"AXLES AND AN ECONOMY EFFESTED, is the title of a booklet issued by Canadian Bearings, Limited, Hamilton. It describes the Wright taper roller bearing axle, and shows how and why superiority is claimed for it over other designs.

THE STANDARD CHEESE BOX BENDER is described and illustrated in a four-page folder issued by the manufacturer, J. T. Schell, Alexandria, Ont. This is one of three pamphlets covering cheese box machinery.

CONTRACTORS' HOISTING ENGINES.—Various styles of Lidgerwood hoisting engines for general contracting purposes are illustrated and described in Bulletin 200, recently sent us by Allis-Chalmers-Bullock, Limited, Montreal.

THE DUBOIS IRON WORKS, Dubois, Pa., in an attractively-bound booklet of 35 pages, describes and illustrates DuBois horizontal gas engines designed to operate on natural, illuminating and producer gas, gasoline, alcohol, kerosene, and crude oil.

GASOLINE, GAS, AND ALCOHOL ENGINES.—The Gilson Mfg. Co. is issuing a new catalogue illustrating and describing Gilson engines. These engines will be shipped from the new Canadian factory now being built by the firm in Guelph, within the next few months.

PAINT MACHINERY.—A new sectional catalogue of paint machinery, color, ink, and printers' roller-making appliances, issued by Wm. & J. G. Greey, Toronto, is to hand. It consists of 80 pages, and gives most complete information regarding everything in these lines.

A MOST COMPLETE CATALOGUE is that of the American Clay Machinery Co., Bucyrus, Ohio. It consists of 230 well illustrated pages, handsomely bound in cloth. Brick, tile and sewer pipe machinery of all kinds, dryers, cars, conveyors, etc., are fully described, and the book should certainly prove a trade-winner.

THE AMERICAN WIRE ROPE NEWS, for January, issued by the American Wire Rope Co., Chicago, shows the company's products used in the rigging of fishing vessels, examples of Gloucester craft being scattered through the pages. Elevator work is also treated of, illustrations being given of the system in use in "The Rookery," Chicago.

"EVERYTHING YOU NEED IN YOUR FOUNDRY," is treated of in general catalogue No. 40, recently issued by the S. Obermayer Co., Cincinnati. It is a book of 370 pages, and could hardly be more complete, both illustrations and text being ample and explicit. The Obermayer Co.'s goods are handled in Canada by the Dominion Foundry Supply Co., Montreal.

THE BAKER WATER SOFTENER, in India rubber and gutta percha machinery are two lines dealt with in catalogues recently issued by David Bridge & Co., engineers and machinists, Castleton Iron Works, Manchester. The last mentioned booklet includes also belt-sewing machines, hoists, Heywood & Bridge's patent friction clutch, and other specialties made by the firm.

A NOVEL ADVANCE AGENT, in the form of an attractively-printed folder, comes from the T. R. Almond Mfg. Co., Brooklyn. Through the cover, by means of an aperture cut in the shape of an Almond drill chuck, is seen a half-tone photo of the company's representative. On opening the folder, his request for an appointment meets the eye of the prospective buyer. The folder should certainly prove a good introduction for the drummer.

OPENING SALES OFFICES.

In order to keep pace with the requirements of their increase in business, the John McDougall Caledonian Iron Works Co., Limited, of Montreal, have opened sales offices at the following places: Montreal, 82 Sovereign Bank Bldg.; Toronto, 810 Traders Bank Bldg.; Winnipeg, 251 Notre Dame St.; Vancouver, 416 Seymour St.; Nelson, Josepnine St.; New Glasgow, N.S., Telephone Bldg. Their principal products are waterworks equipment and all kinds of hydraulic and mill machinery.

THE AUTO SHOW.

The second annual Automobile and Sportsmen's Show was held in the Montreal Arena, April 6th to 13th, and was a success in every way. All available space in the large building was occupied to the best advantage, by displays of motor cars, motor boats, bicycles, automobile accessories, sporting goods, etc., and the buzz of machinery and tooting of horns sent an unaccountable thrill down the visitor's spine.

Among the exhibits worthy of note was a magnificent display of automobile and motor boat accessories, by John Millen & Son, Ltd., of Montreal, and Toronto, among which were to be found gas lamps and searchlights, carburetors, coils, horns, cable, accumulators, voltmeters, batteries, etc.

Adjoining the Millen booth was that of the Chapman Double Ball Bearing Company, with a magnificent display of shafting, wheels, etc., in motion, besides various other devices to demonstrate their double ball bearings. This exhibition was one of the features of the show.

The Berlin Electrical Mfg. Co., Ltd., of Toronto, had an attractive display of batteries and electrical novelties, the feature of which was a light, run by one of their storage batteries.

The Canadian Rubber Co., of Montreal, were very much to the fore and the display of the new "Canadian Clincher" automobile tire was a credit to Canadian industries.

John Forman, Montreal, had on display among his large stock of gasoline engine ingition specialties, the K. W. igniter, of which he has recently secured the sole Canadian agency.

Industrial Progress

CANADIAN MCHINERY AND MANUFACTURING NEWS would be pleased to receive from any authoritative source industrial news of any sort, the formation or incorporation of companies, establishment or enlargement of mills, factories or foundries, railway or mining news, etc. All such correspondence will be treated as confidential when desired.

The G.T.R. will build a subway at Port Hope.

W. G. Paton, machinist, Wingham, has gone out of business.

A waterworks plant will be erected at Welland, to cost $70,000.

The new Vancouver courthouse to be erected will cost $300,000.

The Jenking-Leslie Brass Mfg. Co., of Montreal, has dissolved.

The Imperial Glass Co., Toronto, will erect a factory on Mutual St.

A charter has been granted to the Richelieu Foundry Co., Sorel.

The Anchor Wire Fence Co. will erect a new factory in Stratford.

The G.T.R. will increase their staff and enlarge their shops at London.

The Manhattan Asbestos Co., Black Lake, Quebec, has been dissolved.

The Geo. Foster & Sons Co., Brantford, will erect a $25,000 warehouse.

The Sanitary Packing Co. will build a $20,000 canning factory at Weston.

The Toronto Street Railway Co. is installing a Sturtevant heating apparatus.

Joseph A. Nadeau, proprietor of a sawmill in Carleton, Que., has assigned.

Johnston & McGregor, Smiths Falls, Ont., are advertising their foundry for sale.

The R. Watt Machine Works, Ridgetown, had their foundry damaged by fire.

A $10,000 apartment house will be erected on Broadview Ave., Toronto, this Spring.

The Adams Wagon Works, Brantford, will erect a new brick warehouse to cost $8,000.

The Red Cedar Lumber Co. will build a new mill on the waterfront at Vancouver.

The Sawyer-Massey Company, Hamilton, will erect a warehouse at Saskatoon.

The T. Eaton Co. will build a store on Portage Avenue, Winnipeg, to cost $110,000.

The C.P.R. will rebuild elevator D, at Fort William, which was destroyed last Fall.

The Georgian Bay plant of the Canada Iron Furnace Co., at Midland, was burned out.

The McKinnon Dash and Metal Co., St. Catharines, will erect a chain factory there.

Disston, Son & Co., saw mfrs., Toronto, are making a $15,000 addition to their mills.

The Western Fuel Co., Nanaimo, will erect a new sawmill with a capacity of 15,000 feet.

The Slingsby Mfg. Co., Galt, will make a $10,000 extension to their plant this spring.

A new threshing machine manufactory will be erected at Alliston, Ont., by A. Merner.

The Canadian Westinghouse Co., Hamilton, will erect a $40,000 addition to its plant.

The Hotel Dieu, Kingston, is to be remodelled and made into a mica works for Kent Bros.

The Welland Vale Manufacturing Co. will build a central establishment at St. Catharines.

The Waderlow Iron Works, Leamington, is considering the advisability of moving to Dunnville.

The Stevens Co., Galt, has now its own moulding shop. The first cast was taken on March 26th.

Fire caused $25 damage to the office of the American Abell Engine Co., Toronto, on April 15th.

Calgary capitalists are promoting a $600,000 Rocky Mountain Cement Co., with works at Frank.

The Hall Elevator Company and the Alberta Pacific Grain Co. will build mills at Killam, Alta.

The Welland Vale Mfg. Co., Welland Ont., will build a central establishment in St. Catharines, Ont.

The Toronto Theatre Co. have secured a permit to build the Gayety Theatre on Richmond St. west.

The foundry of the R. Watt Machine Works, Ltd., Ridgetown, Ont., was damaged by fire last month.

The Canada Permanent Loan Co. will erect a three-storey office building at Regina, to cost $60,000.

The C.P.R. will build a branch line between Peterboro and Victoria Harbor, to cost $3,000,000.

The Elk Lumber Co. will build a new lumber mill near Nelson, B.C., to handle annually 12,000,000 feet.

The entire plant of the Georgian Bay Engineering Works, Midland, was wiped out by fire on April 6th.

The McLaughlin Carriage Co., Oshawa, Ont., will erect a new factory for the manufacture of automobiles.

The new physics building of Toronto University will be equipped with a Sturtevant ventilating fan.

A large bolt and fishplate concern is asking concessions with a view to erecting a plant in Three Rivers.

Henry Pickleman has registered in Montreal under the name of the Dominion Mill Stock and Metal Co.

Berlin ratepayers have voted to purchase the Berlin & Waterloo Street Railway, at a cost of $76,200.

The Canada Screw Co. are to enlarge their works at Hamilton, having decided not to locate at Welland.

The Hillman Copper Co. has obtained a charter, the head office of the company to be in Sault Ste. Marie.

The Gurney Foundry Co., Toronto, have secured a permit to erect a one-storey addition to their Toronto Junction plant, to cost $4,000.

Hamilton has decided to ask for estimates on the cost of establishing a municipal electric lighting plant.

The Lake of the Woods Milling Co., Keewatin, will soon have their new mill, costing $1,250,000, in operation.

The Listowel Foundry & Machine Shop has been opened up by George Melrose, with a skilled staff of mechanics.

Rapid progress is being made in the construction of Canadian Iron & Foundry Co.'s shops at Fort William.

The Meisel Mfg. Co., Port Arthur, are building harvester works at the east end of the town to cost $250,000.

The village of Alliston has passed a by-law to grant a bonus of $5,000 to the Merner Mfg. Co., of Waterloo.

The Coupe Mfg. Co., Toronto, which has been engaged in the manufacture of laundry supplies, has been wound up.

A. M. Fraser will erect a twelve-storey bank and office building in Winnipeg. J. D. Atcheson is the architect.

The by-law for the purpose of developing electrical power for Shelburne, Ont., to cost $60,000 was defeated.

Improvements and additions costing about $500,000 will be made to the King Edward Hotel, Toronto, this Summer.

Damage to the extent of $600 was done to the brass works of W. Coulter & Sons, Toronto, on Tuesday, March 12.

The Canadian Underskirt Co. have secured a permit to erect a three-storey factory addition at Queen and Noble Sts.

The Economical Power, Light & Heat Co., Toronto, has purchased a new rotary type of Sturtevant high pressure blower.

It is reported that the works of the Canadian Ramapo Iron Works, Niagara Falls, will be ready to begin operations in June.

The American Steel Wire Co., Cleveland, Ohio, will erect a branch factory at Lethbridge, Alta., at a cost of about $2,000,000.

The Radcliffe Lumber Co., Duluth, have bought blocks of land on Vancouver Island and will erect a large mill there.

Hyslop Bros., Toronto, have secured a permit for the erection of a $30,000 garage at corner of Shuter and Victoria street.

The water commissioners of Niagara Falls have asked for $40,000 for extensions and improvements to the waterworks system.

The contract for the steel pipe for the north Rosedale sewer has been awarded to John Inglis Co., their tender being $4,480.

A wood-working plant is being built at Fort William by the Seamans-Kent

Co., Meaford, to cost $100,000, and to employ 100 men.

It is expected that tenders will shortly be asked for the construction of the C.P.R.'s new line between New Westminster and Eburne.

The large apartment house being erected at the corner of Yonge and Bloor Sts., Toronto, is nearing completition. It will cost $125,000.

The Manufacturers' Life Insurance Co., Toronto, will build a 12-storey block facing on King, Bay and Melinda Sts., to cost $600,000.

A two-storey concrete factory, 100 feet in length and 50 feet wide, will be erected in Stratford for the manufacture of Anchor wire fences.

Mechanical draft equipment is being furnished by the B. F. Sturtevant Co., of Boston, for the Toronto Bolt & Forging Co., Swansea, Ont.

The Freyseng Cork Co., Toronto., will build a three-storey addition to their factory at the corner of Queen and Sumach streets, to cost $7,000.

A plant for the manufacture of car wheels and water pipes will be built at Fort William by the Canada Iron Foundry Co. costing $250,000.

The Packard Electric Co., St. Catharines, Ont., has ordered an 8½-ton traveling crane from the Smart-Turner Machine Co., Limited, Hamilton.

Thessalon, Ont., has voted a bonus of $10,000 to the Saginaw Lumber & Salt Co. to assist the company to build and operate a saw mill in that town.

The Canada Foundry Co. has been awarded the contract for Toronto's supply of cast iron pipe during the twelve months terminating April 1st, 1908.

The rail mill of the Dominion Iron and Steel Co., Sydney, is at present occupied on a contract for 37,000 tons of 100-pound rails for the Grand Trunk.

The premises of the Standard Tin Co. and J. W. Delainey, machinery and tool makers, 160-162 Duke street, Toronto, were badly damaged by fire on April 16.

A permit has been issued for the erection in Montreal of a five-storey building by Williams & Wilson, dealers in machinery supplies, to cost $47,000.

A wire mill will be erected at Lethbridge to cost about $2,000,000, being a branch of the American Steel Wire Co., Cleveland, O. It will employ 1,000 men.

The Canadian Northern Railway will spend considerable during the coming year on repair shops and other buildings required by the company in Winnipeg.

The Mississippi Iron Works at Almonte, conducted for 32 years by Young Bros., has been sold to H. C. Bowland, D. Williams, and W. Glover, all of Almonte.

A tram line from New Westminster to Chilliwack is practically assured. Surveys have been completed, and it is expected that construction will begin this summer.

Stenhouse Brothers will erect a large machine shop in Fort William, capable of doing all kinds of heavy work, vessel repairing, etc. The contract for the building has been let to Cusson & Matthieu.

At the recent International Exhibition held in Liege, Belgium, the Armstrong Bros. Tool Co. was awarded a medal for its exhibit of lathe and planer tool holders.

Messrs. Franklin & Ball, promoters of a bolt and screw industry, are endeavoring to secure favorable terms from the town of Waterford, with the idea of locating there.

The Atikokan Iron Co., Port Arthur, has built blast furnaces and plant for roasting ore, and a large dock. The entire cost is $1,300,000, and will employ 500 men.

The Confederation Life Association, Toronto, has taken out a permit to erect an eight-storey office building on the corner of Queen and Victoria streets to cost $200,000.

The Western Iron Works, of Winnipeg, commenced operations of March 26th, when the first casting was done in the fine, modern plant erected by the company in Elmwood.

Battleford has carried a by-law to raise $90,000 for municipal waterworks, sewerage and electric lighting. Tenders closed on April 15, and the work is to be commenced at once.

A 400-foot addition, six storeys in height, is being made by the National-Acme Mfg. Co., Cleveland, Ohio, to its present factory, which itself is one-eighth of a mile long.

The Dominion Bridge Company has taken over the bridge and structural steel department of the Locomotive and Machine Company, whose works are located at Longue Pointe.

The Smart-Turner Machine Co., Limited, Hamilton, are building a single outside packed plunger pump for the corporation of Calgary, to be used in the waterworks system.

The premises of Fred. Thompson & Co., manufacturing and contracting electrical engineers, 326 Craig street west, Montreal, were damaged by fire to the extent of $3,000, on April 6th.

It is proposed to build an electric railway between Fort Frances and Duluth, when the power dam at Fort Frances and the Great Northern power plant at Duluth are completed.

The Grand Trunk will erect two new elevators, one at Fort William, the other at Tiffin, each having a capacity of two and a half million bushels. They will cost over a million dollars.

Work has begun on the new five-storey fireproof head office building which the Canadian General Electric Co. is erecting, at a cost of $400,000, on the corner of King and Simcoe streets, Toronto.

Bechtels, Limited, Waterloo, and the Anglo-American Leather Co., Huntsville, Ont., have ordered automatic feed pumps and receivers from the Smart-Turner Machine Co., Limited, Hamilton.

The King Electrical Works, Montreal, has been incorporated, with a capital of $30,000, to carry on the business of manufacturers of and dealers in electrical machinery, brass, copper and other metals.

The Montreal city council has approved of a scheme which will assure a supply of 50,000,000 gallons of water to the city per day. The work will cost $2,132,000, and will take four years to complete.

The Saskatchewan Electric Co,, Regina, is succeeded by General Electric, Limited. The new company has a capital of $25,000, and branches will probably be established in Saskatoon and Prince Albert.

It is probable that car works for the building of electric and steam cars will be built in St. Thomas. A number of enterprising citizens have the matter in hand, and the project is now almost an assured success.

The famous steam engine of the Ogilvie Flour Mills, Winnipeg, one of the largest in Canada, and once one of the sights of the city, has been discarded, and electricity is now the motive power employed in the mills.

The National Rolling Mill Co. has been successful in making financial arrangements with the town of Sydney, N.S., for location there, and as soon as a suitable location is selected construction work will begin.

The Sutherland Rifle Sight Co. has asked tenders for the erection of a factory building at New Glasgow, N.S. The main building will be 152x42 feet, in addition to which there will be the power building and office.

A public meeting of St. Thomas citizens has endorsed a scheme to give $5,000 bonus toward the establishment in the city of a Canadian branch factory of a large go-cart concern, of Elkhart, Ind. A by-law will be submitted.

The Asbestos Mfg. Co., of London, Ont., has been incorporated with a capital of $25,000 to manufacture and deal in asbestos. The promoters are H. V. Everham, R. Van Z. Mattison, jr., and R. Van Z. Mattison, sr., all of London.

A large United States concern connected with the marble and onyx industry, is in communication with Mr. Joseph Thompson, commissioner of industries for the city of Toronto, regarding the establishment of a Canadian branch.

W. V. Hunt, of the British Columbia Electric Railway Co., Vancouver, B.C., has been appointed engineer in charge of the work of installing new water power units at Lake Buntington. Three units of 100,000 h.p. each will be installed, at a cost of about $250,000.

The contract for the construction of twenty bridges, from Trout River to Fort William, on the Lake Superior division of the C.P.R., has been awarded to Frank Munro, contractor, of Montreal. The work includes excavation, cement work and pile driving.

Hamilton city council has passed a by-law to raise $62,000 to be spent on extensions to the waterworks system. Of this, $5,000 will be spent on meters, $27,000 on mains, $18,000 on services, and $12,000 on extensions to the filtering basins.

Gajnon & Garon and A. Henuset & Co., Montreal, have registered as contractors. Harold G. Eadie, chief agent for the White Fireproof Construction

SITUATION WANTED.

ADVERTISER, shortly emigrating, seeks position as correspondence clerk and accountant. Well up in all details of engineering and allied business; ledger, balancing, shorthand and typewriting excellent. References Lister, Ipswich Road, Ardleigh, Colchester, Eng.

Co., has registered in the same city, as also Larose & Berthiaume, sash and door manufacturer.

A. Berg & Sons, Toronto, are installing a sand-lime brick plant of 20,000 capacity for the Schultz Bros. Co., Limited, Brantford. It will be in operation at an early date. A similar plant is also being installed by the firm for the Silica Brick & Lime Co., Victoria.

Morgan Harris, Brantford, has purchased the machine shop of J. B. Rouse, at 22 Dalhousie street, and will be joined by Chas. Herod, of the Goold, Shapley & Muir Co., in a general repairing and tool manufacturing business. Considerable new machinery will be installed.

The Dominion Heating & Ventilating Co., Hespeler, has just shipped a fan, heater, a number of cars, and other brickyard equipment to Samuel Watson, brick manufacturer, Orillia. The company is also supplying the Amalgamated Oil Co., of Petrolea, with a complete brickyard outfit.

The Crocker-Wheeler Co., of Ampere, N.J., has opened an office in Birmingham, Ala., owing to the inability of the New Orleans and Baltimore offices to cope with increasing trade. Mr. B. A. Schroder will be in charge of the branch, which will be located in the Woodward building.

A patent on a new blast furnace has been secured by H. W. Hixon, Victoria Mines, Ont. The main features of the farnace comprise a lining of refractory material, and an air-jacket, constituting a sunstitute for the water-jacket formerly used, and through which the air passes on its way to the twyers.

The International Harvester Co. has placed a contract, through Laurie & Lamb, Montreal, the Canadian representatives, for Foster superheaters to be installed in twenty 350-h.p. Sterling boilers. The Copper Queen Consolidated Mining Co. has also placed an order for superheaters in eight Sterling boilers of 400 and 450 h.p.

The F. C. Hunt Plumbing Co., of London, have gone into the supply manufacturing business, having established a foundry at Hensall, about forty miles north of the city. At present they are confining their operations to the manufacture of pumps, soil pipes and fittings. They report trade very good, with some large contracts in prospect.

Construction work has been begun on the Robertson Machinery Co.'s new factory in Welland. The main building, of brick, will be 150x60 feet, and one storey in height. It will be divided into a machine shop, 75x60 ; foundry, 50x60, and a clearing room and storehouse, 25x60. A storehouse, 40x150, of corrugated iron, will be parallel to the main building.

The firm of W. H. Laurie & Co., Montreal, consulting and contracting engineers, has issued a circular to the trade to the effect that the firm name has been changed from W. H. Laurie & Co., to Laurie & Lamb, although there will be no change in the personnel of the firm. The company will, as heretofore, make a specialty of power generation, transmission and utilization.

Hon. S. N. Parent, president of the Transcontinental Railway Commission, was waited upon by a deputation of Quebec citizens on March 29, and interviewed respecting the advisability of forming a company to erect large car shops in that city. Mr. Parent encouraged the proposal, and believed that a large order might be looked for from the Transcontinental Railway.

Duplex pumps are being supplied by the Smart-Turner Machine Co., of Hamilton, to the Victoria Harbor Lumber Co., Whitefish, Ont.; the Midland Engine Works Co., Midland; the E. Long Mfg. Co., Orillia; Jas. Ready, Fairville, N.B.; the Delhi Mfg. Co., Delhi, Ont.; the Berlin Lion Brewery; the Royal Hamilton Yacht Club and the Montreal Reduction & Smelting Co., Trout Mills, Que.

Work has commenced on the new buildings for the Standard Fitting and Valve Co., in Guelph. The machinery building, 70 x 200 feet, is to be completed within the next month, and the foundry, 80 x 164, within one month thereafter. The core room, ovens and japan room will be 25 feet by 50, and the engine and boiler rooms 38 by 40. The cost of buildings and equipment will total $100,000.

The new foundry building for the Niagara Falls Hardware and Foundry Co., for which tenders have been taken, is to be 80 feet by 170 feet, of iron frame, with concrete or brick between the steel uprights near the ground, and windowz above. There will be a 25 or 30-ton crane. Bids have not yet been asked foe construction of the building for offices, pattern rooms and machine shops. It will be 50 or 60 feet by 175 to 180 feet.

A Vancouver firm, Evans, Coleman & Evans, secured from the Winnipeg city council recently a large order for cast iron pipe, amounting to some 6,000 tons. This large contract, the largest expected to be open for competition in Canada this year, was secured against competitors representing nearly all the makers of cast iron pipe in Britain as well as the three Canadian pipe foundries. Cast iron has advanced seriously in price and competition has therefore been keen and close.

The Norton Company, Worcester, Mass., and Niagara Falls, N.Y., manufacturers of grinding wheels made of alundum, and other abressive specialties, is to erect a large addition to its Worcester works. The building designated as plant 2, will be extended about 300 feet in length by 111 feet in width, which will more than double the present capacity. This will be fully equipped with kilns, mixing machines, shaving machines, etc., so as to permit of a large increase io output.

The new building which the Goold, Shapley & Muir Co. is to erect in Brantford, will be on an extensive scale, doubling the present capacity of the company. They consist of a machine shop, warerooms and wood shop, and will cost about $60,000. The machine shop will be erected to the west of the present main plant, and will be 132x54 feet. It will be a one-storey brick structure and will be equipped with a travelling crane 38 feet long, running the entire length of the building.

Baines & Peckover, hardware dealers and manufacturers' agents, have moved from 126 Bay street, Toronto, to 98 Esplanade street east. The new premises are more suitable in every way for carrying the heavy line of goods dealt in by the firm, and have been thoroughly remodelled into the most comfortable and capacious office and warehouse quarters. The fact that the new building is so much closer to shipping facilities than were the old premisrs should prove of great advantage to the firm.

Work on the Hamilton Steel & Iron Co.'s new 300-ton furnace has been making good progress with the favorable weather of the past few weeks, and it is expected that everything will be in running order by July. The total furnace capacity of the plant will then be 500 tons per day. The firm has recently added railway spikes to its list of products. The spikes are manufactured from open hearth basic steel bar, and as this department is an entirely new feature of the company's work, and therefore not yet too hard pressed with orders, it should help considerably those looking for rapid delivery in this line during the present busy times.

The Starr Manufacturing Co., The Dartmouth Rolling Mills, and the Dartmouth Machine and Forge Co., have been amalgamated. In addition to the lines hitherto manufactured by the Starr Manufacturing Co., the amalgamated companies will manufacture merchant bar iron in rounds, squares and flats, wrought iron and steel forgings, carriage axles, saw mill machinery, and structural iron work. The officers of the new company are: J. C. Mackintosh, president; Jas. Simmonds, vice-president; T. Ritchie, G. E. Faulkner, F. H. Oxley, E. D. Adams, H. E. Hill, directors.

After May 1st the Chicago branch of the Niles-Bement-Pond Co. will occupy its new offices in the Commercial National Bank building. The Pratt & Whitney Company will abandon its show room and offices at 46-48 South Canal street, and will combine its machinery sales department with that of the Niles-Bement-Pond Company. The show room and stock of Pratt & Whitney small tools, and the small tools sales department, will be located on the ground floor of the new Plamondon building, Clinton and Monroe streets. Mr. Geo. F. Mills, who has for several years looked after the interests of these companies in the Chicago territory, will continue as manager of the Chicago offices.

The Scott Machine Co. is one of the busiest of London's new concerns. They have just installed in the Tecumseh House, which has recently been overhauled and improved throughout, a laundry and fan outfit for the kitchen, to be operated by one of the Scott Co.'s own gas engines. The company report all iron lines very busy, the only difficulty being annoying delay in the delivery of material. They have secured the contract for overhauling the presses of the Southam Printing Company, a work that will keep a number of men busy a couple of months. Elevator business is quiet with the firm, but from the number of inquiries being made the outlook cannot but be regarded as cheering.

CONDENSED ADS.

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c a word for each additional word.

Motors and Launches

I have the following new complete launches about ready for delivery:

Power Skiff, 20' by 4', fine finish, equipped with 2 h.p. Erd Motor, $190.00.

Launch, 22', 4'6" beam, cedar planking, turtle back deck, torpedo stern, equipped with 7½ h.p. 2 cylinder Erd motor, speed 10 miles an hour, $375.00.

Launch, 25' by 6' beam, cedar planking, quartered oak deck and coaming, equipped with 10 h.p. 2 cylinder Erd motor, speed 11 miles per hour, $550.00.

Erd motors from 2 h.p. to 30 h.p., from $65.00 to $600.00, also one 10 h.p. Buffalo 4 cylinder 4 cycle marine motor, as good as new, $250.00.

One 3½ h.p. Trebert, complete with reversing wheel, used only one season, $400.00.

One 6 h.p. Gillies stationary gasoline engine, cheap.

One 18' by 4'9" clinker built launch, equipped with 2½ h.p. Norwalk engine, launched Sept. 1906, speed 8 miles per hour, a bargain at $225.00.

Companies Incorporated

The Brockville Malleable Iron Co., Brockville, Ont., has obtained a charter.

The Ford Automatic Fire Shutter Co. has been incorporated, with head office in Niagara Falls.

"The Niagara Iron and Steel Co." has been incorporated, with head office at Toronto and capital stock of $750,000.

"Industrial Development Company, of Canada" has been incorporated, with head office at Hull and capital stock of $1,000,000.

The Lacoste Ship-Brake Co. has been incorporated, with $15,000 capital, and head office in Montreal, to manufacture a ship-brake, invented by Louis Lacoste.

The Bawden Machine & Tool Co., Limited, Toronto, has been incorporated with a capital of $100,000, the provisional directors being W. B. Mudie, Geo. Tillie, and C. W. Mitchell.

The Iroquois Mfg. Co., Iroquois, Ont., has been incorporated, with a capital of $40,000, to manufacture machines, tools, utensils, etc. The provisional directors include R. S. Smart, J. Moffatt and T. R. E. MacInnes, Ottawa.

A limited liability company has been organized under provincial charter to take over the business of the Bawden Machine & Tool Co., Toronto, under the same name, with a capital of $100,000, and head office in Toronto.

The Imperial Supply Co. has been incorporated, with head office in Montreal, and a capital of $100,000, to manufacture and sell railway, marine and contractors' supplies, and to act as agents for other makers of the same lines.

The Niagara Iron & Steel Co., of Toronto, has been incorporated with a capital of $1,000,000 to carry on the business of rolling mills and the manufacture of iron and steel rails and a general smelting and refining business.

W. J. Bishop, contractor; W. C. Strachan, manufacturer, and others have been incorporated as The Rexford Bishop, Limited, to carry on a general contracting business, with head office in Montreal. The company is capitalized at $100,000.

The St. Thomas Automobile & Garage Co., St. Thomas, Ont., has been incorporated, with a capital of $25,000, to manufacture automobiles, bicycles, etc. The provisional directors include C. M. Baldwin, A. E. Thomas and T. Hall, St. Thomas, Ont.

The Niagara Iron & Steel Co. has been incorporated, with a capital of $1,000,000 for the manufacture of steel rails and other iron and steel commodities. The incorporators include Hon. J. K. Kerr, J. A. Paterson, Wm. Davidson and G. F. McFarland.

The Labatt Manufacturing Co., London, manufacturing plumbers' supplies, has been incorporated with a capital of $200,000. The provisional directors are: John Labatt and H. F. Labatt, London; H. J. Wood and D. W. Wilson, Buffalo; S. C. Newburn, Hamilton.

The Gurry Patents Co., Hamilton, has been incorporated with a capital of $40,000, to purchase and use the patent of Edward Gurry for a new pig iron moulding machine. The provisional directors are W. D. Long, P. D. Crerar, and E. Gurry, all of Hamilton.

The Doon Twine & Cordage Co., of Doon, Ontario, has been incorparated with a capital of $250,000 for the manufacturing of twines, cordage, and upholstering stock. The provisional directors are: A. Forster, E. G. Perine, J. Stauffer, H. Krug and G. A. Clare.

The Brockville Malleable Iron Co. has been incorporated, the provisional directors being, H. A. Stewart, J. A. Mackenzie, J. I. Mallery, J. Connolly, M. H. Harrison and Dr. Clark. Buildings will be erected immediately and the manufacturing will commence in the fall.

V. J. Hughes, broker; Harold Rolph, engineer, with others, have been incorporated, under the firm name of Metcalf Engineering, Limited, with a capital of $25,000, to carry on the business of civil, mechanical and electrical engineers, contractors and inspectors. The head office will be in Montreal.

J. W. Dowker, A. Dowker, Minnie G. Dowker, J. E. Arnold and W. F. Pratt, have been incorporated, under the name of the Dowker Brick Co., to take over the brickmaking business now carried on by Alem Dowker, the head office of the company to be in Fort Frances, and the capital to be $40,000.

J. A. McRae, Niagara Falls; W. H. Chandler and J. H. McNeil, Toronto, all contractors, with F. H. Markey and R. C. Grant, Montreal, have been incorporated, under the name of McRae, Chandler & McNeil, with a capital of $100,000, to carry on a general contracting business. The head office will be in Montreal.

William Stone, Alfred Jephcott, James P. Murray, Thomas Roden and L. V. Dusseau, all of Toronto, have been incorporated, under the name of Automatic Sprinklers, Limited, to manufacture and install automatic sprinklers and other devices for protection against fire. The capital is placed at $100,000, and Toronto will be the chief place of business.

The incorporation of Westinghouse, Church, Kerr & Company, of Canada, is gazetted, the head office of the company to be in Montreal, and the capital to be $2,500,000, the objects of the concern being to carry on the business of machinists, builders, electrical, civil and hydraulic engineers; to manufacture and deal in engines, machinery, boilers and rolling stock, and to do a general engineering and construction business.

In the course of a short time Sydney C.B., will have another important industry in the shape of a brass foundry, which will give employment to at least 75 men. The company, which will be known as Shaw & Mason, has been organized provisionally and is now seeking incorporation. The company will be capitalized at $100,000. The following are the provisional directors: E. E. Shaw, T. P. Mason, H. C. Burchell, G. A. R. Rowlings, Alex. Johnston, Norman McDonald and J. A. Young. The business of the company will be the manufacture of brass goods of all descriptions and certain lines of cast iron.

What do you require in

Plumbago Facings?

We can not only fill your wants but do so to your entire satisfaction.

Our range includes 50 grades from 1c. to 10c. per pound.

A pleasure to give you further information.

CANADIAN FOUNDRYMEN ATTENTION!

You can save money by dealing direct with the Manufacturers.

We are the only Manufacturers of Foundry Facings and Supplies in Canada, and no matter what you need, our Montreal or Hamilton house can supply it much more promptly and cheaply than you can obtain it through Jobbers or Agents.

Our Shipping Facilities are unsurpassed, and our Factory abounds in the most Modern Machinery for producing high-grade, up-to-the-instant Foundry Facings. Here are a few

SPECIAL MONEY SAVERS

PLUMBAGO AND SILVER LEAD

We import our lead direct from Colombo, Ceylon, in the crude state and prepare it in a way that gives perfect satisfaction. We also manufacture all grades of Foundry Facings, Core Wash, etc. You can save a handsome profit by purchasing of us.

SUPPLIES

Everything you need.

MOULDING SAND

Albany and Canadian Moulding Sand from the finest Brass and Stove Plate to the coarsest Pipe and Core Sand.

The Acme of Excellent Design and Construction

The Globe Tilting Tumbling Barrel

admits of an adjustment in the degree of action on the tumbling parts—regulated by the side hand-wheel. Doesn't injure small stampings or castings, wet or dry. ¶ Tumbling parts can be seen, samples removed and replaced while running; and easily dumped into a small receptacle. ¶ Send for Booklet E.

The "ECONOMY" Wire Wheel Brush

For cleaning castings and metal patterns, for removing scales from hot forgings, axes, shovels, etc., for cleaning sheet brass and copper, and almost every variety of metal work. Special sizes and shapes for special work. Acquaint us with your requirements.

BRANTFORD, CAN., May 17th, 1906

THE OSBORN MANUFACTURING CO.,
Cleveland, O.

GENTLEMEN,—We are pleased to advise you in reply to your recent letter that we have been using the Economy Steel Wire Wheel Brushes for several years and are well pleased with them.

These Wheels have given us excellent results and we firmly believe can be used to advantage in any stove foundry. Yours very truly,

THE WILLIAM BUCK STOVE CO., Limited
C. J. Parker, Sec.-Treas.

Diamo - Carbo Emery Wheel Dresser

ONCE USED ALWAYS USED

Those who have used Diamo-Carbo once keep on using it. That is proof that it has unusual merit.

With Diamo Carbo, wheels can be formed into any desired shape without breaking the edges of the most delicate wheels. It will dress any kind of a wheel used for tool grinding. ***Superior to a black diamond*** and compared with it, costs but little.

Made in Three Lengths:—No. 1, 8 in. long, $3.00; No. 3, 10 in. long, $3.50; No. 5, 12 in. long, $4.00.

How about Diamo Carbo on ten days' trial, delivered F.O.B. your works?

SECURE THE BOOKLET ANYWAY.

Here Is the Magazine you have often wished for—All the Technical Periodicals in one!

TECHNICAL LITERATURE

A Monthly Review of Current Technical Publications.

A large 64-page illustrated journal, giving its readers, in more or less condensed form, **the best** literary material of **general interest** appearing in the current technical publications of America and Europe, as well as much valuable technical information found in daily papers, trade pamphlets, society proceedings, speeches and lectures, etc.

The Index to Technical Articles in Current Periodical Publications

gives a classified descriptive listing of all the articles of importance appearing in the current technical press, brought down to the first of the month of issue.

"Contains more engineering miscellany selected with discriminating judgment than we have seen in any other publication. The reviews of books are very careful and of unusual value for technical accuracy."—*Concrete Engineering.*

"Crammed with well selected stuff, not only what is vital, but also what is obscure—fine technical information in the bodies of corporation reports, speeches, lectures, etc., which often escapes the regular technical press."—*Printers' Ink.*

"This splendid publication is even better than the publishers promised. It should have a place in every engineering, scientific and technical library. We predict for Technical Literature a brilliant career."—*Mining Reporter.*

"No other journal is devoted wholly to the field selected for Technical Literature. It far surpasses any other in the number, length, variety and general interest of its articles reprinted or condensed from its contemporaries."—*Engineering News.*

Subscription Rates, $2.00 a Year. ***Single Copies, 20 Cents.***

SPECIAL OFFER.—As a trial subscription we will send you TECHNICAL LITERATURE for **two months for 25 cents.** Send your quarter to-day for a trial subscription and premium book offer in connection with renewal.

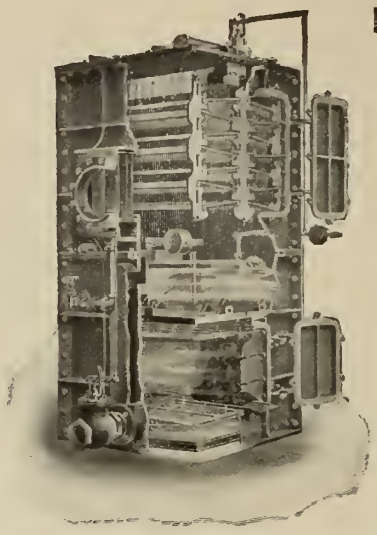
PERPETUAL SATISFACTION



That's what Webster Heaters mean to thousands; because they represent the genius and experience of the entire heating industry. Built on scientific principles they stay built.

THE WEBSTER

FEED-WATER HEATER
PURIFIER AND FILTER

The type shown in the cut is known as the Webster Class "E. C." Heater, made in sizes ranging from 500 to 1,500 h.p. This type assures economy while affording the greatest heating power and highest temperature. It cannot help saving fuel because it is impossible for it to waste steam.

We have interesting particulars to mail interested parties.

DARLING BROTHERS, LIMITED

Toronto **Montreal** **Winnipeg**

Graphite Paints

IT is well known that Graphite makes one of the best paints as a preservative of exposed metal work. It is the best paint to use for iron castings or girders on account of its filling properties thereby giving it a good covering.

Machine Paints

BESIDES the ordinary, our machine paints are made in paste form and can be used as a filler, applied with a knife or thinned with turpentine and brushed on, spreads freely and leaves a good surface.

How Canadian Manufacturers Can Increase Their Export Trade

THE world's markets are worth securing—and the foreign trade situation is particularly favorable to Canadian manufacturers. How well the **American Exporter** is serving Canadian manufacturers in the export field is shown by the fact that nearly a score of large Canadian firms are now represented abroad by this publication. One Canadian firm that has carried an announcement continuously in the **American Exporter** for almost **thirty years**—from its first issue—makes an interesting statement regarding the results thus obtained that other Canadian manufacturers will find it profitable to carefully consider.

If you want to share in the tremendous foreign trade that is now flowing toward the manufacturers of Canada and the United States, write to-day for our specific information on the subject.

Advertisers for 30 Years

The American Exporter continues to be a successful advertising medium for those looking for an extension of foreign trade. As we wrote you some time ago, as advertisers in the publication from the beginning, we have been interested in its development, which seems to have been a steady and continuous one, due largely, we think, to the correct principles upon which it has been conducted. We have had good results from our advertisements in it, and believe that **there is no better advertising medium for securing foreign trade.**

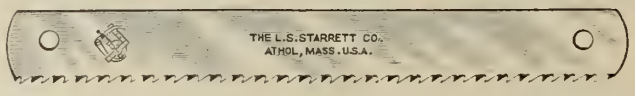
STARRETT TOOLS

ARE THE STANDARD
FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

HACK SAWS



These blades are made of the finest grade of steel. The teeth are sharp, with square cutting points, and evenly set. They are tempered by our improved process, which leaves them hard and tough, so that they will not "shell off." They are too hard to file. The set of the teeth is just enough to insure a free, smooth, and rapid cut, removing no more stock than is necessary.

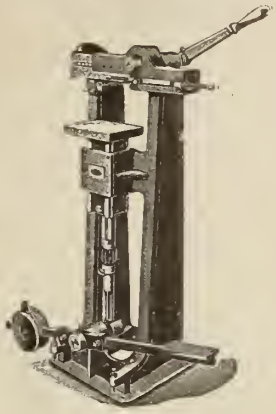
No. 3 Marking Machine



This machine is designed to mark by means of steel dies letters, numbers, trade-marks, monograms, etc., on either flat or round metal surfaces, such as axes, pistol barrels, files, table cutlery, twist drills, taps, dies, reamers and a great variety of work.

Our principle of bringing a slight line contact of die with work insures light wear on dies and makes it possible to mark hollow tubes, handle, chuck and valve work which would not stand the blow of a punch or drop press.

Correspondence and sample of work solicited. Machine sent on approval to responsible parties.

The Production of Pig Iron

Illustrated in the new blast furnaces of the Hamilton Steel and Iron Co.

In Canada the production of pig iron is assuming large proportions. Few realize the amount of iron which is now being turned out from Canadian furnaces; but the building of the new 300-ton blast furnace by the Hamilton Steel and Iron Co. is ample evidence of the importance of this industry in Canada. The development of the iron industry in Canada, and particularly in Ontario, can be well shown by a short history of the development of the Hamilton Steel and Iron Co., Hamilton.

In 1896 the Hamilton Blast Furnace Co. erected a blast furnace on the picturesque shore of Burlington Bay, and in February of that year the first pig iron made in the Province of Ontario was produced. The furnace was designed to give a production of 150 tons per day, and during the first few months of its operation the many difficulties incidental to any new enterprise were encountered. Men accustomed to blast furnace work could not be found in Ontario, and green men had to be trained for the work. The use of Canadian ore alone was found not to be satisfactory, and a mixture of imported ore had to be adopted. In addition to this the price of pig iron during the two years following the establishment of the furnace was probably the lowest ever recorded in the history of the iron trade.

The company, however, did not lose heart. In June, 1899, the Hamilton Blast Furnace Co. amalgamated with the Ontario Rolling Mills Co., Hamilton, under the name of the Hamilton Steel and Iron Co., Ltd., with a capital of $2,000,000. At the time of the amalgamation the plant consisted of one blast furnace, two rolling mills and a forge and washer plant. Immediately after the consolidation the blast furnace was altered so as to increase the output from 150 tons to 200 tons per day. An open hearth steel plant and a steel rolling mill were added. Since then additional furnaces have been added to the open hearth plant, one of which has but very recently been completed.

The company have now under construction a second blast furnace, which, it is expected, will be in operation by August. The furnace is up-to-date in every respect, but, before describing this furnace plant in detail, something of general interest might be said concerning the operation of the blast furnace in the smelting of iron ores.

The Blast Furnace in Theory.

Everyone knows in a general way the construction and operation of a blast furnace. Iron ore is the oxides of iron. In the blast furnace the oxygen is removed, leaving the iron. The furnace consists of an immense stack, as shown in Fig. 1 of the Hamilton Steel and Iron Co. The parts of the furnace are the hearth, the bosh and the stack. The

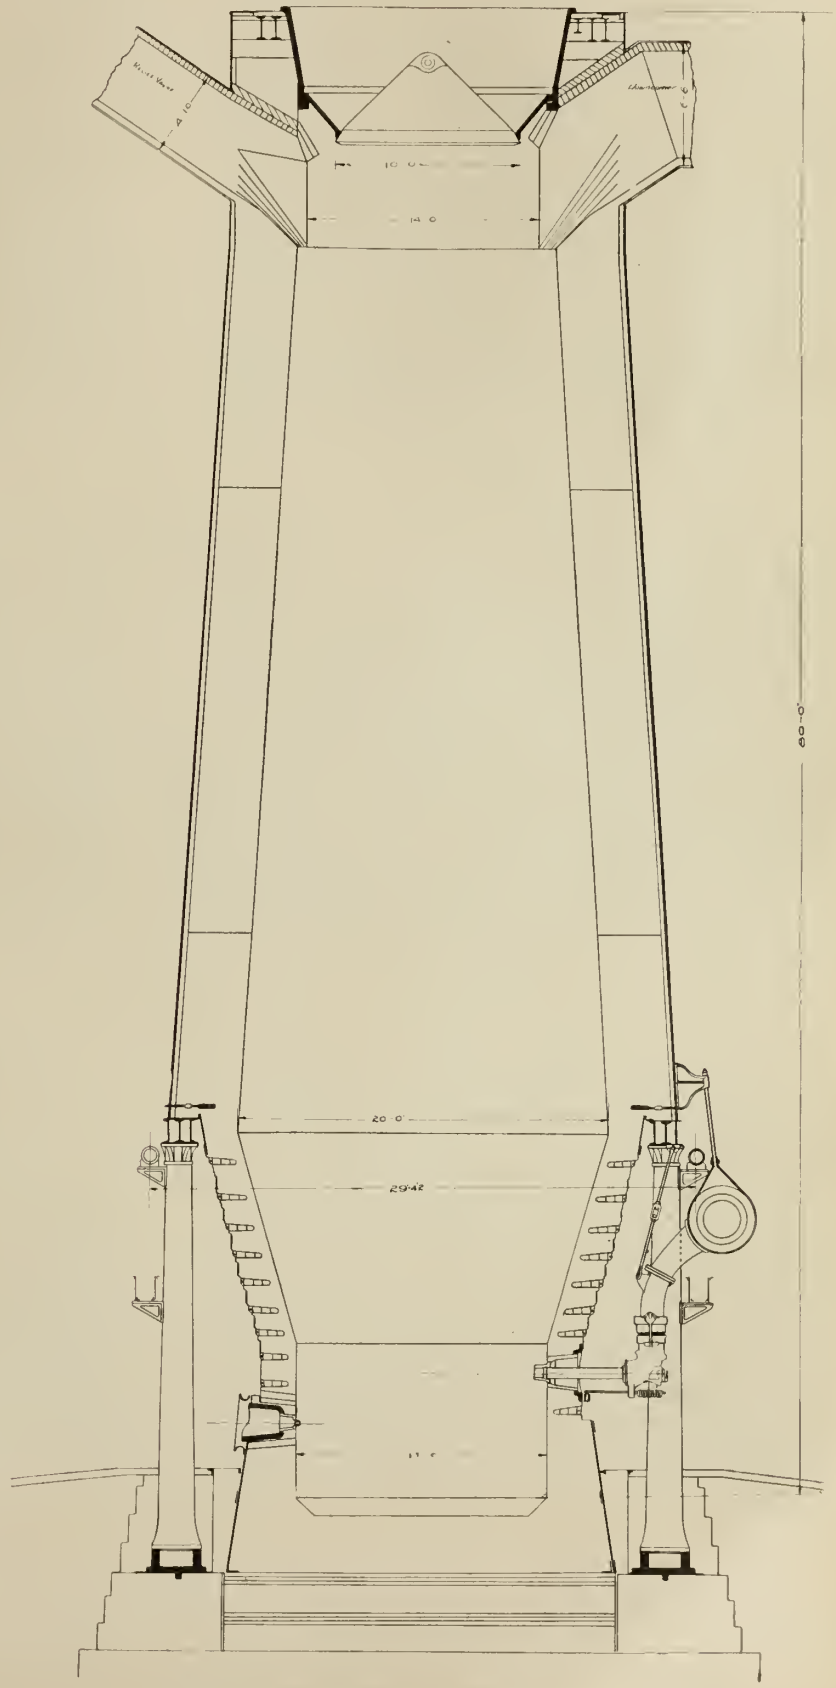

Fig. 1—The New Furnace—Hamilton Steel and Iron Co.

stack is the upper part of the furnace; the bosh is the bulging part, and the hearth is the lower part. The ore, coke, limestone and other necessary commodities are charged at the top of the furnace. Air is admitted at the bottom; the burning of the fuel creates a great heat. The mixture at the top is heated, gradually sinks down, and is melted in the bosh. The melted iron runs down to the bottom of the hearth, where the slag is removed and the iron poured. In brief that is the operation of the blast furnace.

Styles of Ores.

There are several styles of ores, including: Magnetite, composition, Fe O and $Fe_2 O_3$, 72 4 per cent. iron; hematite composition, $Fe_2 O$, 70 per cent. iron, soft ore and hard ore; Limonite, composition $Fe_2 O_3$, 60 per cent. iron; siderite, composition Fe O and CO_2, 48.3 per cent. iron. There are two other ores, both siderite, one mixed with clay and the other with carbonaceous matter. In commerce, ores are known chiefly by names, significant of the section in which the ore is obtained. The most of Canadion ore is hard hematite.

At Hamilton a mixture of ores is used, the best mixture for the different irons required being determined by practice.

Kinds of Pig Iron.

There are two distinct classes of pig iron—white iron and grey iron. In white iron, the carbon and the iron are chemically combined, while in the grey foundry iron the carbon is mixed mechanically with the iron. Pig iron must contain carbon and silicium to give it the desired properties, and it always contains manganese, phosphorus and sulphur.

Uses of Constituents in Charge.

Each constituent in the charge to the furnace has its use. The ore is there to be smelted; the fuel (coke) is to supply heat and to supply the reducing agent, carbon; the limestone (CaO, CO_2) combines with the excess of silica (from the clay in the ore), and is also supposed to unite with the sulphur. The presence of sulphur weakens the iron, and to get rid of it is one of the problems in the blast furnace practice.

Kinds of Fuel Used.

In Canada and the United States, 86 per cent. of the fuel used in smelting is coke, 12 per cent. is anthracite and 2 per cent. charcoal. The advantages of coke as fuel are its rigidity, strength and porosity. Coke makes the stock porous and prevents it from crushing together and forming arches, etc.

Reactions in the Furnace.

According to the reactions which are supposed to take place, the furnace is divided into five zones. The first, and upper, zone is the warming zone, where the CO_2 is driven off the limestone and the moisture from the ore and fuel is evaporated. This makes the ore more porous. The next zone is the reducing zone, where some such reaction as this takes place:

$$CO + Fe_2 O_3 = CO_2 + 2FeO$$

and $$FeO + CO = CO_2 + Fe.$$

Thus the iron (Fe) is free. The carbon monoxide (CO) comes from the union of the oxygen in the air with the carbon in the fuel.

The third zone is the carbonizing zone. Here the iron is in a spongy mass, and absorbs carbon from the coke. The melting point of the iron is thus lowered. Next is the melting zone. Here the iron melts, and there is a reduction of silica (SiO_2) and manganese dioxide (MnO_2) There is also a further absorption of carbon by the iron. The fifth and bottom zone is the burning zone, where the excess of carbon is burned out of the iron. From this zone the slag is removed and the metal run off.

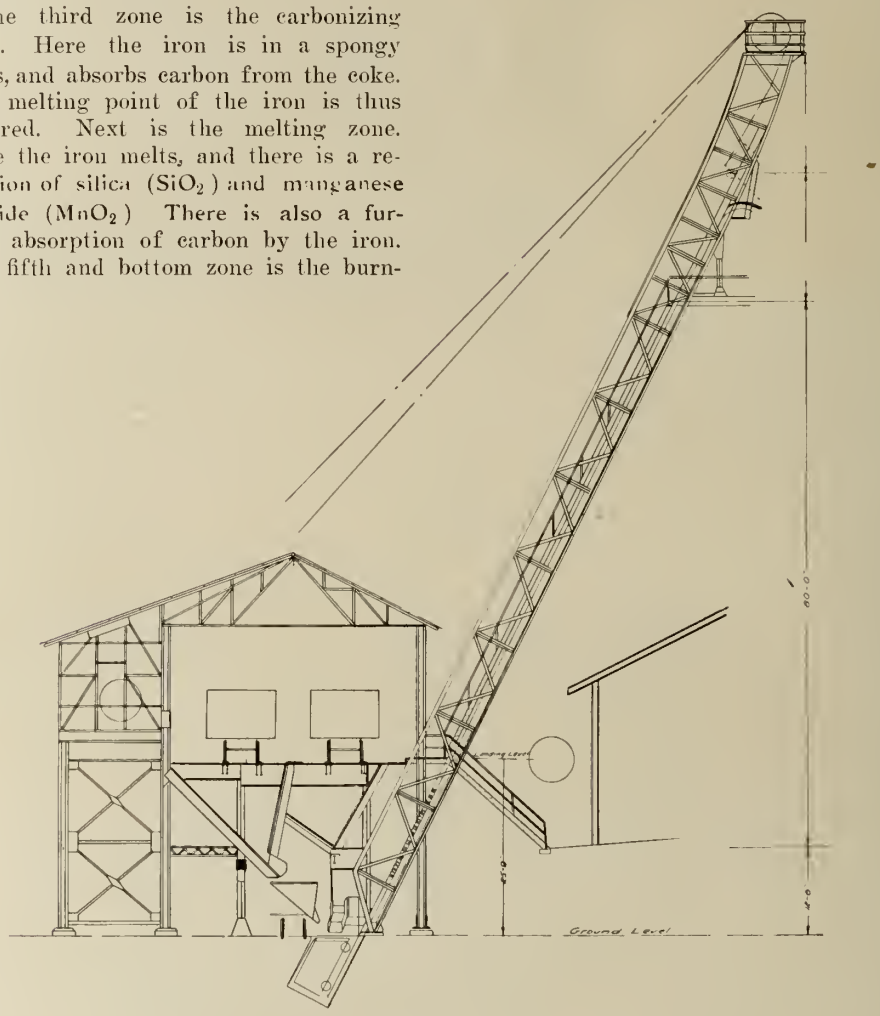

Fig. 2—The Skep and Ore Bins.

Slags and Their Composition.

The slags are chiefly composed of silicates of three substances, namely aluminum oxide ($Al_2 O_3$) calcium oxide (CaO) and magnesium oxide (MgO). These are thus:

$$\left.\begin{matrix} Ae_2 O_3 \\ CaO \\ MgO \end{matrix}\right\} Si\ O_2$$

The composition of the slag predetermines what the proportions of the different ores, coke and limestone should be. Thus, having decided what style of slag is to be produced, the composition of the mixture for the charge can be worked out theoretically. This, of course, will be moderated by practice considerably.

The Air Supply, the Ore Mixture and the Gas.

There are three chief things in the blast furnaces which go through regular cycles of operation, namely, the ore mixture, or stock, the air blast, and the resulting gas.

Cycle of Stock.

The different constituents of the stock are taken from bins, weighed and mixed. The mixture is conveyed by means of the skip to the top of the furnace. Here it is dumped on to a bell. This bell is dropped, allowing the mixture to fall into a chamber on top of a second bell. The first bell is then closed and the second one dropped, which allows the mixture to fall into the furnace. This two-bell arrangement prevents the escape of gas from the furnace. The metal is tapped from the hearth of the furnace into a runner. From this runner the metal is poured into sand moulds,

or is transferred to a pig casting machine.

In the new furnace at Hamilton the weighing and mixing of the different ores and constituents is done automatically. The mixture is conveyed up the skip and is dumped automatically. The new furnace is provided with a modern double bell arrangement. A sectional view of the skip and ore bin is shown in Fig. 2.

The furnace is 85 ft. high, having a 20 ft. bosh and 13 ft. hearth. The top of the furnace is provided with explosion doors, as shown in Fig. 1, and the bell is operated by hydraulic cylinders. The stock is distributed by an apparatus driven with an electric motor.

Cycle of Air Blast.

From the blowing engines the air blast is conveyed to the hot stoves through the cold blast main. In the stoves the air is heated and passes to the bustle pipe, through the hot blast main. The bustle pipe is a large pipe which completely surrounds the hearth of the furnace. From the bustle pipe the air is led through the tuyeres into the furnace, where it produces combustion.

These stoves are immense circular fire brickwork constructions. The hot gas

Fig. 8 Steel Construction of Ore Bins, Showing Stoves and Furnace in Background.

Fig. 9 The Furnace and Stoves as They are Now.

coming from the furnace is burned in these stoves, and the checker brick work absorbs the heat. When one stove becomes sufficiently hot, the gas is led into a second stove and a cold blast connection made to the hot stove. This provides for the heating of the air.

The Hamilton furnace is provided with three stoves, with provision for a fourth. These stoves are of the two passage type, and are each 90 by 20 ft. The valves and valve seats of these furnaces are of the latest design.

The blowing engines are operated by steam. The boiler house contains ten sterling boilers, the total capacity of 3,500 h.p. The blowing engines are compound condensing, built by the Tod Engine Co., of Youngstown, Ohio.

Cycle of Gas.

The gas, which consists chiefly of carbon monoxide and carbon dioxide, is brought from the top of the furnace to the gas main through a large pipe called the down-comer. In this pipe are devices for catching the dust which the gas contains. The gas is then mixed with air and burned in the cold stoves as before described. The burnt gases travel up a flue to the open air.

The Use of Gas for Blowing Engines.

Very often the gas which comes from the furnace is used for other purposes besides that of heating the cold stoves. For instance, it is sometimes used in gas engines for the operation of the blowers. Such a use of gas results in the saving of fuel which would otherwise be used in the production of steam for the steam blowing engines. Practical consideration however sometimes makes it more advantageous to use steam blowing engines.

Construction of Furnace and Stoves.

The outside shell of the furnace consists of steel sheets. The furnace is lined with fire brick, and rests, as is shown in some of the illustrations, on cast iron columns. The hearth is built up inside these columns. The hearth is the hottest part of the furnace, and in order to keep down the temperature as much as possible, and thus lengthen the life of the hearth, it is water cooled. The tuyeres and tuyere connections are also water jacketed. In the Hamilton furnace the capacity of the pumping plant which supplies the water for these cooling jackets will be twelve million gallons per day. The ordinary requirements for the whole plant is about six million gallons. This will be pumped by electrically driven pumps. Auxiliary steam pumps are provided in case of accident to the electrically driven pumps. The electrical power will be furnished by two Canadian Westinghouse engine generators.

The stoves are also built up of steel sheets. They are lined, and the sections are built up of fire brick.

Everything in connection with the furnace is being built in the most substantial manner. The foundations are of concrete resting on over one thousand piles. This work was done by Rowan & Elliott, St. Catharines, Ont. The contractors for the steel of the stack and stoves, dust catcher, cold and hot blasts, were the John Inglis Co., Toronto. The Hamilton Bridge Works, Hamilton, furnished and erected the cast house, skip hoist, and ore bins. Tallman & Sons, of Hamilton, are responsible for the brass and copper work, including the tuyeres, and Purdy, Mansell & Co., Toronto, have put in all the steam and water lines.

The plans for the new blast furnace were furnished by Frank C. Roberts & Co., Philadelphia, who have designed some of the largest and best furnaces in America.

The ores, coke and limestone will all be handled through steel bins, and will be delivered at the bottom of the double skip hoist by electric cars.

The pigs in this plant will be cast in sand. A Brown hydraulic pig breaker will be installed, and each bed of iron will be carried by an electric crane traveling the whole length of the cast house, and will be delivered to the breaker, where each thrust of the ram will break two pigs and the connecting sow into six pieces; these pieces will drop into a chute, which will deliver them into a railway car for shipment.

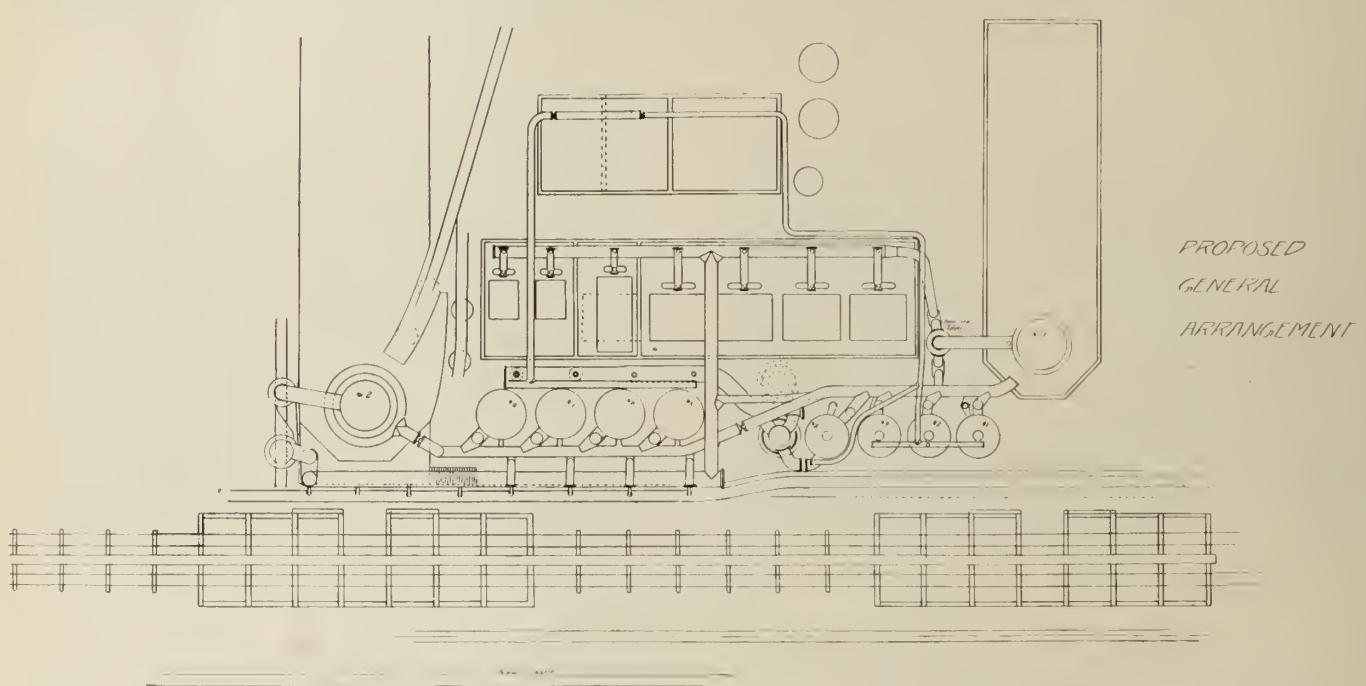

Fig. 3—Ground Plan of Works, Showing Both Old and New Furnaces.

New Furnace to Produce Foundry Iron.

The new furnace will be engaged solely on the production of foundry pig iron. It will be the largest furnace in Canada engaged in this work. As soon as the new furnace is blown in, the present furnace will be used for producing basic iron for the open hearth furnaces. It will be taken to them in a molten condition. A fourth furnace has just been added to the open hearth furnace plant, which brings the capacity up to one hundred thousand tons of open hearth steel per year.

PERSONAL MENTION.

Mr. D. Lorne McGibbon has succeeded Mr. H. C. Miner as president of the Consolidated Rubber Co., Montreal.

Fred A. Geier, president of the Cincinnati Milling Machine Co., has been elected president of the Bickford Drill & Tool Co., Cincinnati, Ohio. H. C. Hoefinghoff, recently deceased, Frank Hushart becomes general manager.

In the death of John M. Dixon, organizer of the Canadian branch of the Amalgamated Society of Engineers, the engineers of Canada and of Ontario particularly will suffer a great loss. Mr. Dixon's life has been one which should inspire and help the rising generation of engineers.

Mr. Charles F. Wolfe, formerly general superintendent of the Waterous Engine Works, Brantford, has accepted a position as inspector with the Canadian Boiler and Casualty Insurance Co., of Toronto. He was presented with a complimentary address and a cabinet of silver, the gift of the employes of the company, on the evening of April 26th. Mr. Wolfe was with the Waterous Company for 35 years.

Mr. J. W. Campbell, manager of the contracts and sales department of the Canadian General Electric and Canada Foundry Companies, was tendered a farewell banquet at the King Edward Hotel, Toronto, on April 23rd, on the occasion of his leaving the position which he has held for 15 years to assume the office of managing director of the Alberta Portland Cement Co., Calgary.

H. Somerville and D. D. Van Every have opened an office at Hamilton, Ont., as consulting and supervising engineers and factory architects. These men have had considerable experience in modern branches of structural, mechanical and electrical engineering, having been engaged upon the design and construction of the following shops: C.P.R. Angus Shops, Montreal, Canada Car Co., Montreal, Lackawanna Steel Co., Buffalo, N. Y., the John Bertram & Sons Co., Dundas, Ont., and M. Beatty & Sons Co., Welland. There is surely a broad field for work such as Somerville & Van Every have undertaken; and Canadian Machinery wishes them every success.

ALUMINUM ALLOYS.

When alloyed with copper, aluminum acts similarly to zinc, but much more strongly, so that an addition of 1 per cent. aluminum produces as much effect as 3.5 per cent. of zinc. Aluminum bronzes are much stronger than ordinary brasses, but those containing 10 per cent. or more of aluminum are so hard that they cannot be worked.

BOOK REVIEWS

PRODUCER GAS AND GAS PRODUCERS. A treatise on producer gas and producer gas plants by Samuel S. Wyer, M.E.; published by the Engineering & Mining Journal, New York; cloth-bound, 296 pages, 9 x 6.

This book is written in a style to be of value to those who may not necessarily be familiar with the laws of thermo-chemistry; the first few chapters of the book are devoted to the explanation of a few of the fundamental laws of the subject, which are used throughout the book. Following these chapters are several on the chemical reactions which take place in the producer, together with a number of computations of the generation and utilization of heat in the producer. The action of steam in the producer is dealt with quite completely. In these chapters the efficiency and fuel requirements of the plants are dealt with.

The author gives a concise historical account of the development of the producer gas plant from the early date of 1669: and this is followed by a complete description of modern pressure and suction gas plants, including descriptions of the detailed construction and action of parts of producers which is not commonly given in the current literature sent out by the different firms. He also devotes some space to the description of gas cleaning operations, and the devices used by different firms for this purpose. Several chapters are devoted to the description of special uses of producer gas, such as firing of steam boilers, firing kilns, and for firing different types of melting furnaces. The operation and testing of the plants is given considerable attention, and a complete data sheet for a test is furnished. The book is completed by what the author calls a "Bibliography of Gas Producers," which consists of a chronological record of what has been written about producer gas or producer gas plants since 1841.

In view of the very considerable interest which is being taken in this subject at the present time, and that the book is written in a way which can be easily understood by anyone who would be interested in the subject, this book will be of considerable general value.

THE COMMERCIAL ORGANIZATION OF ENGINEERING FACTORIES. An exposition of modern practice with forms and precedents for the use of directors, secretaries, managers, accountants, cashiers, and all students of industrial economy; by Henry Spencer; 221 pages, illustrated with tables and blank forms; price 10s. 6d.; published by Spon & Chamberlain, Liberty St., New York.

This book is to one who is interested in the commercial side of engineering as the mechanical handbook is to the mechanical engineer. It gives useful information in concise form which will be of very great value in the formation of companies to carry on engineering work, in the arranging of methods of manufacturing, and in the systematizing of the manufacturing plant generally. It contains chapters on the filing and looking after correspondence, methods of contracting and looking after contracts, conducting of the receiving department and store room, the estimating department, advertising department, manner of looking after orders received, the drawing office, the operation of the costs department, methods of keeping track of the cost of the plant and buildings and the depreciation of the plant and estate, the forwarding department, the accountant's department, the cashier's department, the necessity of complete organization in regard to selling agents and travelers, the secretaries' department.

To a student looking for general information on this subject, this book will be of very great value; and to those having charge of work such as outlined in the contents of the book, it should prove of very considerable interest and value, the work being full of hints for such men in the conduct of their work.

AMERICAN STATIONARY ENGINEERING.—Facts, rules, and general information gathered from thirty years' practical experience as running, erecting and designing engineer. By W. E. Crane. Published by The Derry-Collard Co., New York. 285 pages, 8x5½.

This book is essentially for the practical man. As the author says in his preface, the work is a plain talk on everyday work about engines, boilers and their accessories. It is largely a record of personal experiences of the author, illustrated and explained so as to be of actual assistance to any engineer in the operation of his power plant. Scientific and mathematical discussions are avoided; and all formulas which have been used are simplified to a remarkable extent. The book is well written, and is easily read. Very few books on the market cover this subject in such a practical manner. It will undoubtedly be a popular book with the engineer; and it will also be of very great value to the young and inexperienced engineer.

CANADIAN MACHINERY
and Manufacturing News

A monthly newspaper devoted to machinery and manufacturing interests, mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

TO OUR READERS.

We desire the co-operation of all our readers in making Canadian Machinery of the greatest educative value and interest. Each one can assist towards this end by letting us know his views concerning topics of particular or general interest, by sending us sketches and descriptions of out-of-the-ordinary jobs which he has performed, and, in fact, by letting us hear of anything that would be of interest to others like himself. For such contributions we gladly give suitable remuneration. In this way can readers make the paper of more personal interest to themselves and others.

Canadians naturally take a deep interest in seeing Canadian enterprises forging ahead. To make Canadian Machinery a paper worthy of the approbation of the Canadian mechanical world, we need the personal assistance of Canadians. We can get writers, but we wish Canadian writers and Canadian correspondents. Will you not assist us?

SPECIALIZED APPRENTICESHIP—A NOTE OF WARNING.

Specialized apprenticeship is proposed by the apprenticeship committee of the National Machine Tool Builders. At the recent convention of that association a system of specialized apprenticeship was submitted. This system is simply the training of an apprentice in a special line of work, such, for instance, as the operating of a boring mill in certain class of work, instead of along broad lines in machine shop practice. In this way a man can become productively efficient in a very short time. He can earn good wages in a shorter time than in the general apprenticeship. His value to the employer increases rapidly. The wages during the course are better than in the general course. As manufacturing economies are now, this is good for the employer. He wishes a large number of specialists. From the apprentice's standpoint the system is good. He can start his course at a reasonable wage—a wage upon which he can live; and in a short time he can earn good wages.

Then there is the general aprpenticeship. The time is longer. The wages during that time are smaller. The apprentice has his choice. If he is ambitious and can afford it, he will take the general course: If good pay in a short time is the object, the specialized course suits him. A combination of these has been tested in the Bullard Machine Tool Works, and found satisfactory. So Mr. Bullard says.

So far all seems well, but there is another side. There is a danger in this—a danger that the race of trained mechanics may degenerate into a race of machine operators or specialists. The progress of the manufacturing art is due to the work of thousands of thinking mechanics. The more machine specialists, the fewer all-round mechanics. This will have its effect. The machine operator, who is a specialist only, is lost outside his own line. His view is narrow. He is handicapped. His ambition dies for lack of means of expression. For large manufacturing plants perhaps this is good. System regards men as machines. The more like machines men are, the better for system—but the worse for the man and the worse for the mechanical trade.

But there is still another side to this, as shown in the Bullard works. There men who had been laborers became machine operators through this specialized course. Lack of opportunity, lack of ambition or lack of ability prevented them from becoming mechanics. They be-

came machine operators—specialists. They bettered themselves. That is well.

The combination of the specialized and general apprenticeship as suggested by the committee is undoubtedly good. In very many cases it would be to the advantages of employer and employes. But let us not forget that our modern methods of specialized manufaeture may be detrimental to the advancement of manufacturing methods.

In the future we may see manufactories operated like clockwork; each man performing his work as a wheel or pinion in the large machine; but we may also find but few men to think, to originate, to plan, to do their part in lifting manufacturing to a higher plane.

MORE ATTENTION SHOULD BE GIVEN PAPERS.

At the recent convention of the American Foundrymen's Association it was quite evident that the close proximity of the convention hall to the Supply Association exhibit was not advantageous. The one interfered with the other, and the convention suffered. One of the chief objects in the presentation of papers is to bring ont discussion on the topic of the paper. Owing to frequent interruptions and to delay in commencing the proceedings of each session, there was not the diseussion on the numerous subjects that there should have been. Close application cannot be given to the reading of papers unless the convention room is free from interruptions. For intelligent discussion there must be elose application.

At next year's convention the meeting room should be arranged at some distance from the exhibits. The noise of the exhibits would not penetrate to the convention rooms, and there would be fewer interruptions than at the Philadelphia convention. The importance of the convention proceedings should be impressed upon the members. This would be influential in securing a better attendance. These objects should be worked for at next convention: Opening of sessions on time; a better attendance; no interruptions, and much more discussion.

AMERICAN FOUNDRYMEN'S ASSOCIATION HAS A WORTHY OBJECT.

When we see fourteen hundred men gather together in convention from far and near, the natural query is: Why? What do they gain? That number of foundrymen and foundry foremen gathered at Philadelphia at the recent convention. Why did they come? What did they gain? These questions are soon answered. The convention provided a means for social and business intercourse between a large number of men drawn together by the ties of a common calling. It provided a means for the interchange of ideas and knowledge of foundry practice.

Papers on subjects of great moment were read by men who have made a special study of such subjects. Opportunity for discussion was afforded. The Supply Association made an exeellent exhibit of foundry machinery and supplies. This afforded a means for studying the latest appliances and ideas and comparing one with another. From the papers, from the discussion, or from the exhibits much useful knowledge and many useful ideas were stored up by the visiting foundrymen for future use. That is reason enough.

The objects of the Foundrymen's Association are purely educative. The one aim is to elevate founding to a higher plane. Since the inception of the association a great deal has been done towards fulfilling this aim.

The association is doing good work. It deserves hearty support. That Canadian foundrymen realize this is evident. Over fifty Canadians were at Philadelphia. Next year the convention will be held in Canada. Canadian foundrymen will unite to make this convention a more successful one than has been.

LESSENING THE JAR OF MACHINERY.

J. Derôme, in a recent issue of the Revue Scientifique (Paris, April 20), discusses the problem of the suppression of vibration in industrial installations. As he says, although it is not one of the most pressing questions, it is, nevertheless, one that has not yet received satisfactory solution.

Municipal authorities, as a rule, make it one of the conditions of installation that the machinery be built on a solid bed of masonry. In a number of cases this masonry has been laid in "made" ground, which, of course, does not fully meet the requirements of the authorities.

The most satisfactory solution reached is probably the recent invention of Mr. Jolivet, which depends on the following principle:

"In place of relying on the elasticity of rubber or cloth, which decreases as time goes on, the machine is placed on a series of numerous metal springs of steel, grouped in parallel between sheets of iron, the whole constituting an elastic plate or bed. The plate thus made up, whose total thickness does not exceed two inches, may be placed under the masonry foundation, or between two parts thereof, or between the machine and the foundation.

"The springs, generally of coachspring form, are, in the interior of the plate, surrounded with some insulating material such as felt, whose purpose is to damp the vibrations of the metal. The number of the springs and their individual elasticity are determined by the nature of the installation."

SOMETHING TO BOAST OF.

"A workman's proudest boast, is the pay well earned, for work well done." Take note of the implied grounds of satisfaction. "Good work—at an honest price"—a job a craftsman can look at with self-complacency, a cost at which the buyer gets a bargain. Surely the best of business foundations for a reputation, in shop, office, or out-door gang—and therefore something to be proud of; also a good profitable basis for both producer and customer. "Good work cheap at the price," has built both reputation and many strong concerns. It is a little motto Canadians might take for their industrial battle cry and if they live up to it it's a talisman that is sure to win.

Concerning Tool Rooms

A Practical Tool Room System for an average size shop, such as the writer has seen in successful operation.

By Geo. D. MacKinnon

It is the desire of the writer of this article, not to describe an ideal system which might be put into operation in some ideal shop, having ideal men in all its departments, from the manager down to the water boy—the only kind of an establishment where such a system could be put into useful service—but one combining a number of the best features of those with which he has come in contact—and the purpose of the writer will probably be better served by a description of a system suitable for a machine shop of, say, one hundred to one hundred and fifty men, of which class we have not a few in Canada.

Each system, however, must vary in detail with the shop and the class of work done; for when one is doing a very special class of work, special tools are required, and the system is not as complicated as in a shop doing miscellaneous machine work.

Best Location for Tool Room.

In the general economy of the works, the location of the tool room is an important factor; and it should be situated where it will be most convenient for the majority of the men in the shop. If the shop consists of a central bay with two side floors, the best location for the tool room will be about the centre of one of the sides, either in an annex to the main building, or else occupying a portion of one of the side floors. The former location is the more desirable.

Tool Room Should Be Enclosed.

But wherever it is located it should be entirely enclosed, so as to make it separate and distinct from the rest of the shop, for in this as much as in anything else, the efficiency of the tool room depends. There should be no access to it to the shop employe, except for good and sufficient reasons; and in some cases the writer has found it decidedly better to make the rule absolute, and prevent all but tool room employes entering. This is especially the case where the check system is in use, and the workman is held strictly accountable for his tools. This rule is for the purpose of protecting him as much as anything else.

Construction of the Tool Room.

A tool room, inside the shop, constructed with the lower portion of the walls made of matched lumber about five feet high, and with heavy wire netting above, serves the purpose as well as anything else, and has the advantage of thorough ventilation and lighting—two necessary features which all shop managers admit, but for which very many neglect to provide.

Necessary Equipment of Tool Rooms.

It is generally admitted that it is necessary to have in connection with the tool room an equipment of machines capable of taking care of all new tool work and the ordinary run of repairs; but of what this equipment should consist will depend upon the scope and organization of the tool department. In a shop such as the above the writer has found it advisable to combine several departments, which, in larger works, are usually separate.

THE STEWART CO., LIMITED
MACHINE SHOP
TOOL LIST

Name..... .....
Reg. No..... Date.....

All blue prints, sketches and gauges must be returned to the Tool Room before 1.00 p.m. Saturday. Any man failing to return these will be fined at the rate of 5 cents for each article not returned. All damage or loss of tools will be charged to the owner of the check held as receipt unless such damage or loss is proved to have been unavoidable.

Each workman will be held responsible for the following list, at the prices annexed :

NO.	NAME	PRICE
	Bolts	15
	Brush	15
	Carriers	30
	Centre punches..... ...	.05
	....	
	....	
	....	
	....	
	....	
	....	
	Tools, Lathe	25
	Wrenches.....	35

Other tools needed can be obtained from the Tool Room on leaving a check as receipt.

All Repair and Tool Room Work Under One Foreman.

These are, besides the small tool department, the machine and motor repair department, belt fixing gang, and shafting oilers; and it is well to have all this work done under the superintendence of a competent foreman, who will also have charge of tool shop. In this way one man is responsible for the running of the machines, and whenever it may be necessary to take down, say, a countershaft to rebush pulleys, rebabbitt boxes, etc., on account of lack of oil, he knows just where to place the responsibility. This is also true in the case of belt repairs; and it is not then necessary to look all around the shop for the one who is supposed to attend to that work, with the consequent loss of time of both the machine and the operator. He is located at once from the tool room as he will naturally work under the orders of the tool room foreman, who will know of his whereabouts.

With such a scope and organization, machines suitable for the accommodation of the different classes of tools and repairs peculiar to the shop, are readily decided upon.

These should be located in one end of the tool room, and partitioned off by wire netting from the tool serving department.

Run Tool Room With Separate Motor.

If electric power is in use throughout the shops it is desirable that the tool shop be run with a separate motor, so that repairs may be made here after hours without running, possibly, a long line of shafting to accomplish the result.

Should be Toolsmith in Tool Room.

In connection with the tool shop the writer has found that it not only is a great convenience, but is economical besides, to have a tool-smith in this department; then all new forged tools can be made here, and all tempering, hardening, etc., be done. In a shop of this size one smith and a helper are able to take care of all such work, and, being under the charge of a responsible foreman, there is a minimum of delay in filling rush tool orders—a very important item in shop economy.

Tool Grinding Done in Tool Room.

Whether the machine equipment will comprise universal tool grinding machines will depend upon whether the work being done in the shop is of a special class permitting a large number of parts to be put through at one time on a piece-work rate, or whether it is of a varied class done by day labor. If the former, a tool grinding machine is usually a necessity, for men do not care to stop—and in fact should not be required to shop—their machines to grind tools, with the consequent delay in production. But in the latter case they usually prefer to grind their tools to suit themselves; and I have often seen

a machine hand going direct to the emery wheel, with a most carefully ground tool, which he had just procured from the tool room, simply because it did not measure up exact to his own idea of rake and clearance.

Detail Equipment of Tool-Room.

Having then decided upon the tool shop and the scope of the tool department, it is an easy matter to decide upon the equipment of the tool serving section of this department. This equipment is one which should be as simple as it can possibly be made. It's true that in some shops, doing a very high grade of work, very carefully fitted compartments are frequently necessary for the proper storing of special and expensive tools, jigs, gauges, etc.; but when it comes to having a special slot in a special case for a certain ordinary machine bolt—such, as I have seen arranged—with other things in proportion—then the working of the system is going to clip a little more off the net profits of the concern. The simpler we can arrange our tools, so that they can be selected and served to the workman with the least possible delay, the better the system will be.

Combined Check and Charge System Best.

It has been the writer's experience that a combined check and charge system for the issuing of tools is desirable, and this is carried out in this way: Whenever a man engages to work in the shop, to whom it is necessary to serve tools, a tool list is made out for him. This is numbered either with his time register number or a special tool room number. The former is to be preferred, if it can be so arranged with the time department. This list is as per Fig. 1, and is filed away in its numerical order. A bunch of, say, twelve brass checks, bearing the same number as the slip, is given to him, together with a duplicate tool list; and these checks are charged to him on these lists.

Then, should the man desire a number of standard tools which he is to retain for an extended period, these, too, are charged to him. His bunch of checks is then available for special tools. It is desirable that the number of checks in the tool room belonging to each man be kept as small as possible, as there is then much less liability of their being misplaced and lost.

With this system it is necessary that when a man is quiting work, and before he is paid off, he must secure from the tool room foreman a clearance note, which is addressed to the time-keeper and which states whether he has or has not returned all his tools. If he has settled satisfactorily with the tool room the note is marked O.K.; but if not, the missing tools are noted, and charges made for them from standard charge list—which amounts are deducted from any moneys due him.

Of course it is not to be supposed that every man can return all the tools he has worked with for months past, and a good deal of discretion must be used in such cases so that no injustice will be done the men.

(To be continued).

Specialization in Apprenticeship Courses

Two Systems of Apprenticeship Proposed by the Committee on Apprenticeship at the Machine Tool Builders' Convention—one General and one Special.

Two systems of apprenticeship, one system, general, covering the entire machinists' trade, as apprenticeship has always done, and the other a special system, covering a single branch of the trade, were proposed by the committee on apprenticeship at the convention of the National Association of Machine Tool Builders, at Fortress Munroe, May 14 and 15. At the present time there is the demand for specialists in the machine shop, and this has led to the testing of this special apprenticeship course. The report of this committee was brought in by E. P. Bullard, Jr. This special system of apprenticeship is the result of experiments tried in the Bullard Machine Tool Works.

The idea at the base of the special apprenticeship system is that in the present condition of the machine-manufacturing industry the chief demand is for specialists, and also that, by reason of the shortened time in which a man may become proficient in a single branch of the trade, it is possible to pay materially higher wages to special than to general apprentices, and thus attract many young men who must have a living wage, but who cannot live on the wages which can be paid to general apprentices.

With both systems it is proposed to supply the apprentice with a set of tools at the beginning of his apprenticeship, which are to remain the property of the employer until the completion of the term, at which time they are to be given to the apprentice.

The apprentices at the completion of their term should be presented with diplomas, naming the shop in which they have worked and the special branch of the trade to which they have been apprenticed.

Wage Rate to Apprentices.

The length of the general apprenticeship course was recommended to be three years. The wages paid during those three years was to be 8, 10 and 13 cents per hour respectively. In the special apprenticeship course the time would be shorter, and the wage rates higher, these varying with the class of work.

Thus, for turning and planing the course is to cover two years, the rate of wages advancing each six months, and being 12, 14, 16 and 18 cents. For the vertical and horizontal boring mill the term is to be 1½ years, the rate advancing at the end of each six months, and being 15, 17 and 20 cents. In the case of drilling and milling, the term is to comprise a single year only.

In the Bullard Works, Mr. E. P. Bullard says it has been found feasible to train very efficient men by this specialized system of apprenticeship; and it is possible to greatly increase the earning capacity of such apprentices in a very short time.

Some of those taken in at the Bullard Works in this special course were beyond the usual age of aprenticeship, the applicants being men of natural ability, but working as laborers only, and a good proportion of them have increased their earning capacity threefold. In other cases it has been possible to obtain farmers' sons who were unable to take the general course, because of the lower wages, but who, by reason of the self-sustaining wages offered at the beginning of the special courses, have been able to take those courses and have done so.

The systems are so arranged that an apprenticeship may be transferred from the special to the general course, with suitable credit for the time served. In the Bullard shop in some cases young men had begun with a special course, saved up money from their wages, and then taking the general course, living for a time partially upon their savings.

Mr. Bullard's idea was that eventually the general apprenticeship course would become largely a means of training men and traveling representatives.

Producer Gas, Its Manufacture and Use

Relative Cost of Steam and Gas Compared

By J. R. Armer, Grand Trunk Railway, Toronto.

At the last meeting of the Central Railway and Engineering Club of Canada. Mr. J. R. Armer gave a most instructive paper on "Producer Gas and its Manufacture." This paper is long, and a few of the outstanding features have been abstracted.—(Editor.)

After telling of the manufacture of different kinds of gas, including coal gas, used for illuminating and other purposes, and blast furnace gas, the writer of the paper went right into the subject of the manufacture of producer gas.

The methods of manufacturing producer gas may be classified under two headings, according to the way in which the draft is created, namely, induced or forced.

Fuels Used in Gas Making.

Almost any carbonaceous fuel may be used in the manufacture of producer gas, including charcoal, coke, hard coal, lignite, peat, wood, sawdust and even city refuse. If coal is used, it should be of good quality. It should have a low percentage of ash, and should not clinker. In case the gas is to be used in gas engines or in the manufacture of iron, it should contain a low percentage of sulphur. The coal should be as nearly uniform in size as possible, and not too large. The fuels used in suction producer gas plants, which are the most common in small units, are usually coke or anthracite coal. These fuels do not clinker, and they produce a gas containing a low percentage of tar. Lignite and peat have been used in Europe in pressure producers, and the gas has been used for gas engines in many instances.

Some of the devices used for cleaning are as follows: liquid scrubbers, rotary scrubbers, deflectors and absorbers. The abstraction of tar is one of the greatest difficulties met with in cleaning producer gas, and as its elimination is absolutely necessary for the best results in gas engine practice, the means adopted for its removal are very important considerations.

Where there is an excessive amount of tar some builders use rotary scrubbers, or tar extractors, in addition to the wet scrubbers. They claim very satisfactory results. Other makers, instead, advocate having the fires so arranged that the tendency is for the tar to be converted into a permanent gas in the producer. To accomplish this the products of distillation are passed through a hot bed of fuel.

One of the important points about a producer gas plant is the short time required in starting, and the little attention required when it is standing idle; even after several hours' idleness the plant may be started and be working at its full capacity in a few minutes.

The labor required to operate with a pressure producer plant is about the same as that required for a steam plant of similar size, while with a suction producer plant the labor required is much less.

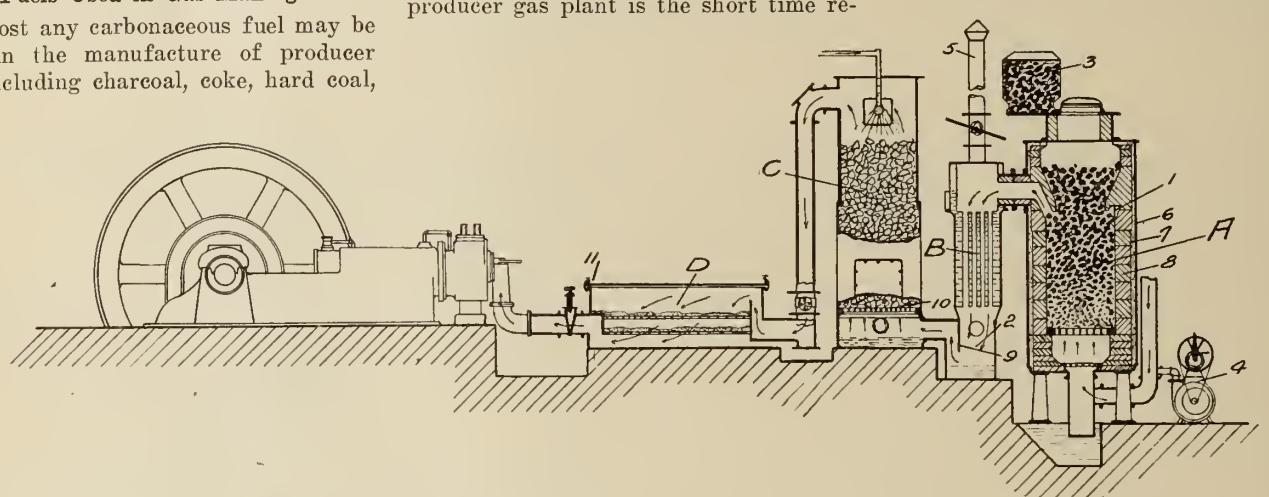
The amount of water used in a producer plant is not more than half that required in a steam plant of similar size. If the cooling water, used in the scrubbers, be used over and over again this will be greatly reduced.

No more skill is required to handle a producer gas power plant than is needed for a steam plant of similar size; but it may require some time for men trained to handle steam plants to become accustomed to gas engines and gas producers.

Operation of Producer Gas Plants.

For best results, plants should be kept clean; pipes should be kept gas tight, and arranged so that they may be cleansed of dust and tar; scrubbers should be inspected periodically, to see if the coke or other material is clean enough to assure efficient working. They should be cleaned once in six or eight months, according to conditions.

The fire should be drawn from the producer about once a week, and the clinkers removed; if the fires are rekindled immediately so that the fire brick lining is not chilled, the life of the lining will be prolonged considerably.



TYPICAL SUCTION GAS PLANT

The regulation of the steam supply to the producer is of considerable importance. In pressure producers the regulation is not very difficult, but in suction producers, where the air supply in the producer depends upon the load on the engine, it requires special attention. The amount of steam going into the suction producer must always be proportional to the amount of gas used by the engine, so that the fires will neither become too hot nor be dampened. Different firms have different methods of regulating this.

Gas Power Plants vs. Steam Power Plants.

In the case of the gas producer, the gas is conveyed to the engine cylinder, where almost perfect combustion is obtained. The losses in this case are oc-

casioned mainly by the heat radiated from the producer and connecting pipes, in the heat lost in cooling the gas, in cooling the engine cylinder, and in that lost in the exhaust from the engine. The amount of energy lost in this way compared to the amount originally in the coal is very large; the proportional loss, however, is much smaller than in a steam plant.

In a steam plant all the combustion takes place in the fire box, under poorly regulated conditions, an excessive flow of air always being required which carries a large proportion of the heat up the stack, together with unburnt gases, and particles of carbon in the form of smoke. The remaining heat is absorbed by the boiler in generating steam, or is radiated from the fire box; further losses occur through the radiation from the steam pipes and engines, and finally there is the large loss from the exhaust on the engine.

The following heat losses in a modern steam plant, when compared with the losses in the gas plant, will give an idea of where the greater efficiency of a gas power plant, over a steam plant, comes in: Out of 13,500 B. T. U., the value per pound of coal used in the fire box, 135 B. T. U. were lost in ashes, 675 in radiation from the boiler, 2,970 in chimney loss, 190 in auxiliary exhaust, 520 in radiation from steam pipes and engine, 7,737 in the exhaust from the condenser, 1,273 were converted into power. Considering the mechanical efficiency of the engine as 93 per cent., this would give 1,176 B. T. U. as delivered from the engine in B. H. P. By comparing 1,176 B. T. U. with the original 13,500 B. T. U., the efficiency of the whole plant is 8.7 per cent.

As a comparison with this, the following figures have been taken from a report on tests made with the Crossley suction gas plants and gas engines by consulting engineers and others, and read before the Manchester Association of Engineers in connection with a paper on this subject.

In the tests reported, the thermal efficiency of the plants ran as high as 24.95 per cent. One of these tests was made with a plant at Milford-on-Sea Electric Works, which at the time of making the test had been in operation for some months. The efficiency of this plant was low in comparison with some of the results obtained, as will be seen, so that the comparison is conservative. The fuel used was anthracite coal having a heating value of 14,895 B.T.U. per lb. The indicated horse power of the engine was 46.25 I.H.P. The test lasted 3 hrs. 49 mins. The total amount of coal used was 133.5 lbs.; the coal used per I.H.P. hour was .785. Assuming that the mechanical efficiency of the engine was 85 per cent. the amount of coal per B.H.P. would be .89 lbs. The value in B.T.U. of .89 lbs. of coal would be 13,256 B.T.U., which when compared with 2,545, the B.T.U. value equivalent to 1-H.P., gives the efficiency of the whole plant including the mechanical efficiency of the engine as 19.35 per cent. If the losses in this case be divided up according to the usual proportion of loss in the different parts of the suction producer power plant they will be as follows: Out of 13,256, the B.T.U. value of the fuel used, 2,651 are lost in ashes, radiation, cooling of gas, etc., 4,445 in exhaust and 3,166 in cooling the cylinder; the remaining 2,994 are converted into power; the efficiency of the engine being 85 per cent., 2,545 of these are converted into B.H.P.

In comparing these two plants, the efficiency of the steam plant being 8.7 per cent., and that of the gas plant being 19.35 per cent., we find a saving of 55 per cent. in favor of the suction producer power plant. In neither of these cases has allowance been made for standby losses, which favor the steam plant.

Regarding fuel required per H.P., manufacturers make numerous claims, many of which have been substantiated. The claims average about 1 lb. of anthracite per H.P. per hour, and vary from 0.6 to 1 1-3 lbs. per B.H.P. per hour. The 0.6 figure is pretty low, but numerous tests have shown a consumption as low as .8 lbs. anthracite per B.H.P. per hour.

Considering the high thermal efficiency and the many other points of advantage about a producer gas power plant, its outlook for the future is very bright. It has passed the experimental stage and has become a formidable competitor of all classes of power. Its field of usefulness will doubtless be widened greatly and already it is being considered as a means of propelling vessels, driving traction engines and for developing power under many other conditions.

Discussion on Paper.

In the discussion of this paper several points of interest were brought out. Mr. Samuel Groves said, that the pioneers in this country in this work were the French Canadians. To his knowledge over ten suction gas plants had been installed in Quebec. In England they are ahead of both Canada and the United States in the utilization of the gas engine. The United States, however, have beaten the world in the use of the gas producer. The best practical results in Canada have been achieved at Wellington, Prince Edward County, Ont. There, with a 65 h.p. suction gas plant, electrical energy is being supplied at $20 per h.p. year, 10 hr. day; 18 arc lamps for street lighting, at $530 per annum. The stores and residences pay one-half cent per night for continuous incandescent light. Mr. Groves spoke of the electric furnace as having a bright future; and brought out the fact that the waste gases produced in the electric furnace are comparatively pure, and are, therefore, very suitable for use in the gas engine. He predicted that the suction gas producer system would play an important part in opening out and developing industries in the great Northwest, were lignites abound.

Mr. R. J. Goudy pointed out that the economy of the gas engine operated by producer gas lies in the almost direct conversion of the energy in the coal into work. He said that the United States navy were adapting the gas producer and gas engine in naval work.

Mr. J. J. Fletcher said that he was opposed to gas producer power plants simply because it was against his profession; he is a steam man. If the gas producer power plants are to be our source of power, he would have to learn the profession over again in the direction of gas producer power plants.

RICE LEWIS & SONS' MACHINERY DEPARTMENT.

Rice Lewis & Son's Co., Toronto, have started a new department in their business, a machine tool and general machinery department. In branching out into this line, the company were of the opinion that there was a large field for such an undertaking. They were of the opinion that there should be closer relationship between the buyer and the seller. They have arranged so that intending purchasers may obtain reliable information as to the best machine for their purpose. Their salesmen will be men well acquainted with machinery which they sell, so that they may advise as to the best machine for the work required of it, should the purchaser desire such information.

The company have secured a number of good agencies, to which they will be continually adding. At present their chief lines will be machine tools and power machinery. Later they will handle woodworking machinery. They will stock a sample line of machinery. It will be their object to make deliveries as quickly as market conditions will allow. New machinery will receive their chief attention.

This new department is in charge of Mr. Rossiter Kellogg.

In this new undertaking the company have behind them the reputation which they have gained in lines more or less closely related to machinery; and their new department will be conducted in a way befitting this good reputation.

Foundry Practice

MODERN IDEAS FOR THE TRADE.

Modern Foundry Practice

By Samuel Groves.—Article II.

After Nasmyth's ladle, in 1838, came Jackson's invention of his gear-moulding machine in 1855. Just as the worm-geared ladle was the initial step towards introducing applied mechanics into the foundry, with a view of the labor-saving in the handling of material; so, the advent of the spur wheel moulding machine marks the transition from crude, rule-of-thumb practice to more scientific founding, and greater economy in the production of castings.

Jackson's Gear-Moulding Machine for the specific purpose of moulding toothed wheels was a stroke of genius; since it represented not only an immense advance in foundry practice, as we shall see, but supplied a long-felt want. In those days, as now, toothed wheels were in universal demand in workshop, factory, mill, and mine. The first cast-iron gear wheel was made at Coalbrookdale, Staffordshire, England, in 1782. From that time until 1855, the conventional method of manufacturing was to mould them from full patterns;

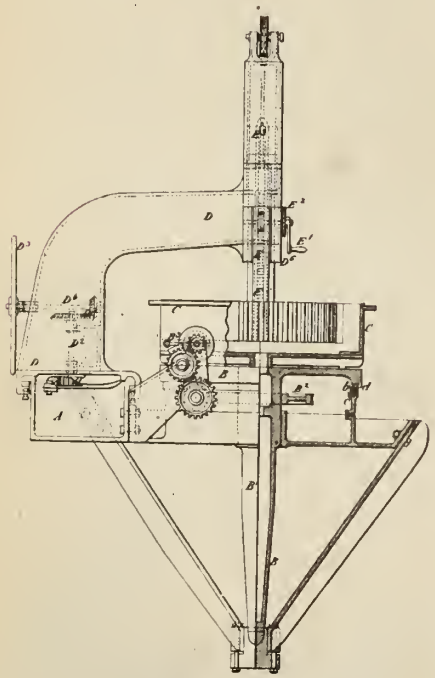


Fig. 5—Jackson's Gear Moulding Machine.

but it had been found that the constant rapping and soaking with water caused the patterns to warp and get out of shape. Moreover, with a view of aiding the withdrawal of the pattern from the sand, it was found necessary to allow draft on the face—leaving in the casting a permanent defect; for a gear with tapered face is wrong mechanically; and many accidents were due to this cause. Another serious defect of this hand-moulding system, was the irregularity in the pitch of the teeth—caused by patching; for experience proved that in spite of rapping, water soaking, and draft, it was almost impossible to lift a many toothed pattern from the sand without bringing away lumps of facing from the tooth moulds.

A gear wheel not true in diameter and face, and with teeth unequally spaced, is practically useless as a mechanical appliance. Under the old regime, it

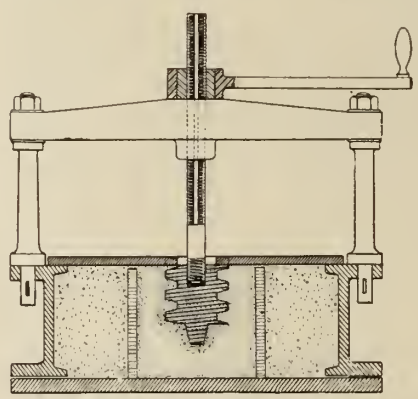

Fig. 6—Worm Moulding Machine

was well nigh a hopeless task to turn out a gear wheel without one or other of the defects indicated; hence, there was general dissatisfaction with the foundries. But the coming of Jackson's moulding machine brought about a complete revolution; since it provided an effective remedy for the defects inherently associated with the prevailing system of moulding (1) by rendering obsolete, costly full patterns; (2) by doing away with draft; and (3) by guaranteeing perfect concentricity, and equal spacing of teeth. And yet, notwithstanding these manifest advantages, so conservative were the owners of foundries generally, that in 1892 the engineering concerns in Great Britain and the United States having gear-moulding machines, could be counted on one hand; while in Canada there was not one. About the year 1896, however, there seemed bright prospects of a widespread adoption of gear-moulding machines;

Fig. 7—Stripping Plate and Drawback Machine.

when all at once came a startling counter action, similar to another phenomenal change in engineering practice which took place a year or two earlier.

At the beginning of the last decade, 1890, it seemed as though cable railways and rope drive traveling cranes were firmly entrenched, when almost without warning electricity came in, and swept away in two years, both systems. With like suddenness came in high-grade tool steels, together with milling and gear-cutting machines, ensuring perfect gears having faces parallel to the axis, and teeth spaced with contoured with mathematical regularity. This innovation enabled the factory, rolling mill and steelworks engineer to design machines and appliances on a scale of strength and magnitude undreamed of previously; for they could now use large steel gears having the precision and exactitude of clockwork, instead of the coarsely-moulded specimens produced from full pattern, or cores in the foundry. As a consequence, the moulding machine as applied to the making of gear wheels, received a setback; it almost seemed as though its days were numbered. Time, however, has proved—even in the case of gears to be cut—the utility of moulding the forms by machinery—especially those of magnitude. Steel has not displaced cast-iron in the manufacture of gears—except in the case of high powers; and from the

signs of the times is not likely to do so. In both cases, particularly the latter, there is a strong reaction in favor of the gear-moulding machine. The reasons

Fig. 8—Universal Gear Moulding Machine.

are obvious. Even where the teeth are to be cut, it is better not to cast a solid rim, since in so doing initial stresses are set up in the neck of the arms next the rim, due to unequal shrinkage, caused by lack of uniformity in section. Besides, in cutting the teeth out of the solid rim, the hard, close-grained, combined carbon next the skin is taken away, leaving the coarse grained softer metal as a wearing surface. In 1896 the writer made a plea in favor of this view, before the American Foundrymen's Convention at Philadelphia.

Now, even firms making a specialty of gear cutting, are using moulding machines, and instead of casting solid rims in their gears, are leaving a film of metal around the teeth contour, thus avoiding unequal shrinkage, and at the same time getting the advantage of the close-grained metal as a wearing surface—in this way increasing the life of the gears. In the United States and Great Britain, there is hardly a steel foundry in existence without a series of gear-moulding machines. Another advantage of this system is, that the simple pattern rig for hundreds of gears can be stored in a comparatively

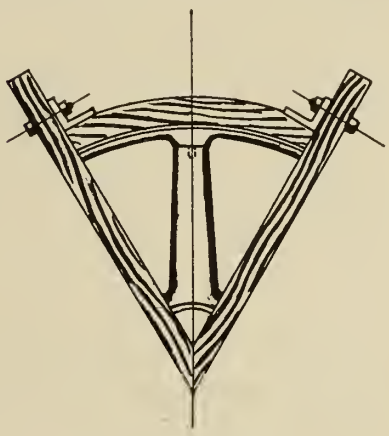
Fig. 9—Tooth Block.

small building; for all that is required is a tooth block, and two core boxes for arms and centre core, whereas the area needed for an equivalent number of full patterns would cover an acre of ground, be an expensive first cost and would depreciate very rapidly.

Inasmuch as Canada is destined for great industrial development, and gear-moulding in both cast-iron and steel, is likely to play an important part in the "good time coming," it may be deemed an opportune moment to set forth with as much brevity as is consistent with clearness, the principles and latest practice in the moulding of gear wheels by machinery.

Moulding a Worm.

The common method of moulding a worm is, to form the mould by means of a pattern made in halves. Now, these pattern halves can not be withdrawn from the sand direct, owing to the overhanging of the thread; they must be twisted out. Anyone who has tried to do it knows how difficult it is —patching and mending invariably follow. This trouble, together with the enlargement of the mould due to rapping,



ARM CORE BOX.

Fig. 10.

added to the unsightly fin which appears on the casting at the parting line of the pattern, renders this old plan altogether unsatisfactory. But the machinery moulder has completely overcome these difficulties by bringing to his aid a simple mechanical appliance (Fig. 6).

A brass pattern is chased in the lathe, leaving the necessary allowance for contraction. This pattern, with tapered core print at lower end, and tapped hole in top for receiving lifting rod, is set vertically in the flask, hand packed with suitable facing, rammed around and scraped off. This done, a plate having a hole in the centre of the same shape and rake as thread of worm, and also a cross bow with guiding gland in middle, is secured to top of flask. The lifting rod, with left-handed screw, is then inserted into the pattern, and the pattern screwed out of the mould up through the slot in cover plate; the mould of each thread being self-slicked in the process of withdrawal. The cope is then put on, rammed, gated, and the mould poured. Thus, by a simple method of machine moulding, duplicate worms, perfectly smooth and true, can

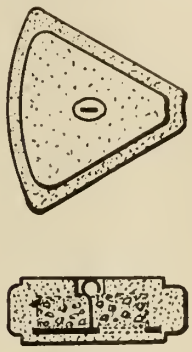


Fig. 11—Green Sand Arm Core.

be cast in greatly increased quantities and at comparatively small cost.

Moulding Smaller Gears and Pinions.

It would not pay to mould pinions and smaller gears required in quantities on a revolving table machine like that shown in Fig. 7; the process would be altogether too slow. Neither is it economical to mould the blanks in the foundry and cut the teeth in the machine shop. A more satisfactory plan is to prepare a cut toothed iron brass, or aluminum pattern, and mould from same on a simple, draw-back mould forming machine, similar to that shown in Fig. 7.

With scientifically selected sands and facings, and care in the operation of the machines, a laborer can make these gears almost as fast as a skilled moulder can turn out the blanks. The castings will be superior to cut gears; for while the flanks of the teeth are smooth and clean, and the pitch true, they will have the additional advantage of the hard skin of combined carbon as a wearing surface.

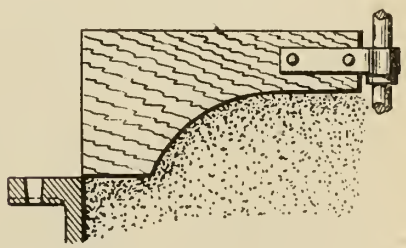

Fig. 12—Sweep for Bevel Reverse Mould: Cope.

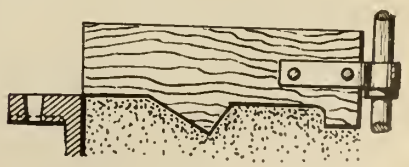

Fig. 13 Sweep for Bevel Bed Drag.

Universal Gear Moulding.

Gears over 12 inches and up to 72 inches in diameter, are generally made on a revolving table machine like Fig. 8;

with either straight or bevelled faces; and with either external or internal teeth, the shape of which may be either spur, staggered, helical or worm. Supposing a wheel 40 inches in diameter, having 84 teeth 1½-inch pitch and 4½-inch face is required, a full pattern would take at least five days to make, and cost from $20 to $25; whereas, all that would be required for machine moulding would be a single tooth block pattern (Fig 9); a sweep for tooth backing; and a radial box for green sand arm cores. (Fig 10). These latter would take from 1½ to 2 days in the making, and cost less than one half the price of a full pattern. The centre core in both cases would be made in a standard core box. From this the reader will readily perceive, that by the machine moulding process, the gear could be made and installed before the full pattern was ready for the sand—a manifest advantage in the matter of breakdowns in factories.

The "modus operandi" of moulding a 40-inch wheel on the "universal" machine is as follows: The cast-iron flask with planed points is placed on the table and carefully levelled, so that it is perfectly horizontal. The bottom plate is then covered with a layer of coke, for venting, and covered with floor sand which is well rammed and vented. The inside of the perforated flask body is then daubed with clay wash and packed with floor sand; supplemented with a refractory facing of a grade suited to the general metal section of the gear. By means of a sweep with a radial face piece and judicious ramming, a substantial wall of sand is left, forming a backing upon which the series of tooth space moulds are to be built. This done, the tooth block pattern, having been adjusted properly, is lowered into the mould, so that it touches both the bottom and backing. Thereupon, the moulder with a bucket of selected facing near him, sifts the sand into the pattern cavity with one hand, and rams, by means of a short rod of iron, with the other; taking care to firmly secure the tooth space mould to the backing by means of nails. After pushing a vent wire down through the tooth into the coke below, soaking the top with water and sleeking with a trowel, the leather on top of pattern is gently rapped with a wooden mallet; then the moulder takes hold of the hand wheel behind the pattern, gives a half turn and the tooth block is withdrawn inwards towards the centre of the flask, clear of the point of the tooth space mould. Without delay, the operator lifts his hand to the star handle connected to the rack and pinion on the balanced vertical spindle above, gives a few turns and the tooth block pattern is hoisted out of the flask. The pattern is then cleaned. Whereupon, the moulder steps to the left, gives a certain number of turns to the handle on the index plate, and the table revolves just enough to give the requisite pitch of the teeth. Straightway, the tooth block is lowered again into the mould, and by means of the wheel on the eccentric drawback device, is pushed forward to the mould backing —only a distance of one pitch away from the inter-tooth space form already made. The process of ramming, etc., is repeated and repeated, until the inner circle of the mould is completely filled with projecting tooth space forms. The flask is then carried into the core oven for drying. So far, provision has only been made for moulding the teeth; we now come to the rim, arms and hub.

In the best modern practice, the arms of gears are made in green sand (see Fig. 11); designed for arms of I shaped section. Seeing these cores have to be hung in the cope, it is necessary to build up the core on a grid, in which is cast a lifting hook. The central part is made of coarse gravel sand, and cinders, from which small diagonal vents are carried to a main vent in the top. These sectional cores are skin dried in the core oven, or by means of the portable drying apparatus, and coated with a refractory solution; the aim being to prevent the burning of the silica in the green sand, and at the same time to ensure a smooth and clean surface on the casting.

The cope for a spur gear has a plain joint surface; the only exceptions being the apertures for centre core, arm core lifting rods, overflow and runner gates, hence, is generally made on a striking plate adjoining the machine. The runner gate is invariably placed around the centre core, with two or three inlet holes, the object being, to deliver the molten metal into the hub, from whence it flows out through all the arms simultaneously to the rim and teeth, thus ensuring a more homogeneous casting.

Gears with staggered, helical, or worm teeth are all made in like manner; but bevels are made somewhat differently. The drag is filled with hard rammed sand and a form coincident with back of curved arms is swept as per Fig. 12, and coated with parting sand. The cope is then put on, rammed with sand, vented and removed. The sand in drag which formed the reverse mould, is then dug out, and by means of another sweep (Fig. 13), the lower face and backing upon which the inter-tooth space moulds are to be built by machine is formed. The bevelled tooth block is then adjusted, and the operation of machine moulding the teeth begins; the process being similar to that of spur tooth moulding, except that instead of the pattern being withdrawn horizontally, it is hoisted vertically: otherwise the processes are identical.

To the uninitiated, the operations described may seem somewhat complicated; in actual practice, however, the work is comparatively simple. Having made one of each of the various kinds of toothed wheels on the machine, subsequent work is only duplicate as regards method; hence, any intelligent, conscientious moulder, gifted with patience and a capacity for exact work, can soon become expert.

Standard Methods for Analysis of Iron

Report of Committee of American Foundrymen's Association

At the annual convention of the association in 1905, this committee reported a method for the determination of silicon in iron, and last year added methods for determining total carbon and sulphur. The committee now adds methods for determining graphitic carbon, manganese and phosphorus, thus including all the determinations usually made on iron in which occasion for difference between the buyer and seller is apt to arise. The report will therefore include all the methods decided upon.

We would also like to call attention to the following quotations from the report of 1905, which indicated the intentions of these methods.

"In recommending the above method, it was recognized that it is almost an impossibility to get chemists to use a standard method in their daily work. Hence the above method, as recommended, is intended primarily as a check method in case of dispute between laboratories, or as between buyer and seller.

"Hence a method, accurate in every point was sought, shortness being sacrificed to some extent to insure accuracy or the chance of error by a careless operator. Little in the above is left to the judgment of the chemist.

"It will be further recognized that in the purchase and sale of pig iron or castings under specification, that standard methods are essential in order to allow the parties of both parts to make their determinations with the assurance that, on the score of method, they are on the same footing."

We wish also to emphasize the ideas involved in the selection of members of this committee—that is to have representatives from commercial laboratories as well as works chemists, and to have

members from different sections of the country. The success in carrying out these ideas will be seen by the following list of members :

Andrew A. Blair, Booth, Garrett & Blair, Philadelphia.
H. E. Diller, chemist, Western Electric Co., Chicago.
H. E. Field, metallurgical engineer, Macintosh, Hemphill & Co., Pittsburg.
R. F. Flinterman, chief chemist, McCormick division, International Harvester Co., Chicago.
Allan P. Ford, metallurgist, Eaton, Cole & Burnham Co., Bridgeport, Conn.
J. O. Handy, chief chemist, Pittsburg Testing Laboratory, Pittsburg.
J. R. Harris, chief chemist, Tennessee Coal Iron & Railroad Co., Birmingham, Ala.
H. C. Loudenbeck, chief chemist, Westinghouse Air Brake Co., Pittsburg.
R. S. MacPherran, chief chemist, Allis-Chalmers Co., Milwaukee.
W. G. Scott, chief chemist, J. I. Case Threshing Machine Co., Racine, Wis.
Henry Souther, Henry Souther Engineering Co., Hartford, Conn.
Prof. Thomas B. Stillman, Stevens Institute of Technology, Hoboken, N.J.

Determination of Silicon.

"Weigh one gramme of sample, add 30 c. c. nitric acid (1.13 sp. gr.); then 5 c. c. sulphuric acid (cone). Evaporate on hot plate until all fumes are driven off. Take up in water and boil until all ferrous sulphate is dissolved. Filter on an ashless filter, with or without suction pump, using a cone. Wash once with hot water, once with hydrochloric acid, and three or four times with hot water. Ignite, weigh, and evaporate with a few drops of sulphuric acid and 4 or 5 c. c. of hydrofluoric acid. Ignite slowly and weigh. Multiply the difference in weight by 4702, which equals the per cent. of silicon."

Determination of Sulphur.

Dissolve slowly a three gram sample of drillings in concentrated nitric acid in a platinum dish covered with an inverted watch glass. After the iron is completely dissolved, add two grams of potassium nitrate, evaporate to dryness and ignite over an alcohol lamp at red heat. Add 50 c. c. of a one per cent. solution of sodium carbonate, boil for a few minutes, filter, using a little paper pulp in the filter if desired, and wash with a hot one per cent. sodium carbonate solution. Acidify the filtrate with hydrochloric acid, evaporate to dryness, take up with fifty c. c. of water and two c. c. of concentrated hydrochloric acid, filter, wash and after diluting the filtrate to about 100 c. c. boil and precipitate with barium chloride. Filter, wash well with hot water, ignite and weigh as barium sulphate, which contains 13,733 per cent. of sulphur.

Determination of Phosphorus.

Dissolve two grams sample in fifty c. c. nitric acid (sp. gr. 1.13), add 10 c. c. hydrochloric acid and evaporate to dryness. In case the sample contains a fairly high percentage of phosphorus it is better to use half the above quantities. Bake until free from acid, re-dissolving in twenty-five to thirty c. c. of concentrated hydrochloric acid, dilute to about sixty c. c., filter and wash. Evaporate to about twenty-five c. c., add twenty c. c. concentrated nitric acid, evaporate until a film begins to form, add thirty c. c. of nitric acid (sp. gr. 1.20) and again evaporate until a film begins to form. Dilute to about 150 c. c. with hot water and allow it to cool. When the solution is between 70 degrees and 80 degrees C. and fifty c. c. of molybdate solution. Agitate the solution a few minutes, then filter on a tarred Gutch crucible having a paper disc at the bottom. Wash three times with a three per cent. nitrate acid solution and twice with alcohol. Dry at 100 degrees to 105 degrees C. to constant weight. The weight multiplied by 0.0163 equals the per cent. of phosphorus in a one gram sample.

To make the molybdate solution add one hundred grams molybdate acid to 250 c. c. water, and to this add 150 c. c. ammonia, then stir until all is dissolved and add 65 c.c. nitric acid (1.42 sp. gr.). Make another solution by adding 400 c. c. concentrated nitric acid to 1100 c. c. water, and when the solutions are cool, pour the first slowly into the second with constant stirring and add a couple of drops of ammonium phosphate.

Determination of Manganese.

Dissolve one and one-tenth grams of drillings in twenty-five c. c. nitric acid (1.13 sp. gr.), filter into an Erlenmeyer flask and wash with thirty c. c. of the same acid. Then cool and add about one-half gram of bismuthate until a permanent pink color forms. Heat until the color has disappeared, with or without the precipitation of manganese dioxide, and then add either sulphurous acid or a solution of ferrous sulphate until the solution is clear. Heat until all nitrous oxide fumes have been driven off, cool to about 15 degrees C.; add an excess of sodium bismuthate—about one gram—and agitate for two or three minutes. Add fifty c. c. water containing thirty c. c. nitric acid to the liter, filter on an asbestos filter into an Erlenmeyer flask, and wash with fifty to one hundred c. c. of the nitric acid solution. Run in an excess of ferrous sulphate and titrate back with potassium permanganate solution of equal strength. Each c. c. of N-10 ferrous sulphate used is equal to 0.10 per cent. of manganese.

This determination requires considerable apparatus ; so in view of putting as many obstacles out of the way of its general adoption in cases of dispute your committee has left optional several points which were felt to bring no chance of error into the method.

The train shall consist of a pre-heating furnace, containing copper oxide (Option No. 1) followed by caustic potash (1.20 sp. gr.), then calcium chloride, following which shall be the combustion furnace in which either a porcelain or platinum tube may be used (Option No. 2). The tube shall contain four or five inches of copper oxide between plugs of platinum gauze, the plug to the rear of the tube to be at about the point where the tube extends from the furnace. A roll of silver foil about two inches long shall be placed in the tube after the last plug of platinum gauze. The train after the combustion tube shall be anhydrous cupric sulphate, anhydrous cuprous chloride, calcium chloride, and the absorption bulb of potassium hydrate (sp. gr. 1.27) with prolong filled with calcium chloride. A calcium chloride tube attached to the aspirator bottle shall be connected to the prolong.

In this method a single potash bulb shall be used. A second bulb as sometimes used for a counterpoise being more liable to introduce error than correct error in weight of the bulb in use, due to change of temperature or moisture in the atmosphere.

The operation shall be as follows : To one gram of well mixed drillings add 100 c. c. of potassium copper chloride solution and 7.5 c. c. of hydrochloric acid (conc.). As soon as dissolved as shown by the disappearance of all copper, filter on previously washed and ignited asbestos. Wash thoroughly the beaker in which the solution was made with 20 c. c. of dilute hydrochloric acid (1.1), pour this on the filter and wash the carbon out of the beaker by means of a wash bottle containing dilute hydrochloric acid (1.1) and then wash with warm water until all the acid is washed out of the filter. Dry the carbon at a temperature between 95 and 100 degrees C.

Before using the apparatus a blank shall be run and if the bulb does not gain in weight more than 0.5 milligram, put the dried filler into the ignition tube and heat the pre-heating furnace and the part of the combustion furnace containing the copper oxide. After this is heated start the aspiration of oxygen or air at the rate of three bubbles per second, to show in the potash bulb. Continue slowly heating the combustion tube by turning on two burners at a time, and continue the combustion for thirty minutes if air is used ; twenty minutes if oxygen is used. (The Shimer crucible is to be heated with a blast lamp for the same length of time).

When the ignition is finished turn off the gas supply gradually so as to allow the combustion tube to cool off slowly and then shut off the oxygen supply and aspirate with air for ten minutes. De-

tach the potash bulb and prolong, close the ends with rubber caps and allow it to stand for five minutes, then weigh. The increase in weight multiplied by 0.27273 equals the percentage of carbon.

The potassium copper chloride shall be made by dissolving one pound of the salt in one liter of water and filtering through an asbestos filter.

Option No. 1.—While a pre-heater is greatly to be desired, as only a small percentage of laboratories at present use them, it was decided not to make the use of one essention to this method; subtraction of the weight of the blank to a great extent eliminating any error which might arise from not using a pre-heater.

Option No. 2.—The Shimer and similar crucibles are largely used as combustion furnaces and for this reason it was decided to make optional the use of either the tube furnace or one of the standard crucibles. In case the crucible is used it shall be followed by a copper tube 3-16 inch inside diameter and ten inches long, with its ends cooled by water jackets. In the centre of the tube shall be placed a disk of platinum gauze, and for three or four inches in the side towards the crucible shall be silver foil and for the same distance on the other side shall be copper oxide. The ends shall be plugged with glass wool, and the tube heated with a fish tail burner before the aspiration of air is started.

Graphite.

Dissolve one gram sample in thirty-five c. c. nitric acid (1.13 sp. gr.) filter on asbestos, wash with hot water, then with potassium hydrate (1.1 sp. gr.) and finally with hot water. The graphite is then ignited as specified in the determination of total carbon.

Convention of American Foundrymen

Convention to be Held in Toronto Next Year.

At the closing sessions of the American Foundrymen's convention, which was held in Philadelphia from May 20 to 24, Toronto was recommended as the convention city for next year. The decision was left in the hands of the executove. Dr. Moldenke, secretary of the association, says Toronto will be the next place of meeting. The decision rests chiefly with him. At the closing session of the Supply Association, the decision as to the next place for holding their exhibits was left to the executive; but a strong recommendation to hold the exhibits in the same city and in conjunction with the convention of the American Foundrymen's Association. was passed. Thus it is practically decided that the foundrymen's convention and the exhibit of the Foundry Supply Association will be in Toronto in 1908.

It was at first planned to hold the convention in Toronto, and to have the exhibits in Niagara Falls, N.Y. This, however, was finally decided inadvisable.

To Canadian foundrymen this decision regarding the place of next year's convention is of prime importance; and to the large number of Canadians present at the convention it is gratifying that their efforts in that direction have been influential. At the closing sessions of both the Foundrymen's Association and the Supply Association, L. L. Anthes, Toronto Foundry Co., Toronto, pointed out in a convincing manner the many reasons for holding the entire convention in Toronto.

Large Number of Canadians Present.

The increasing interest which Canadian manufacturers and Canadian foundrymen are taking in the advancement of founding in Canada was evidenced by the large number of Canadians who attended the convention in Philadelphia. Forty-four Canadians registered, and there were many there who did not register. Those registered are, in order of registration :—

T. J. Best, the Best Steel Casting Co., Quebec.
David Reid, Canadian Westinghouse Co., Hamilton.
J. K. H. Pope, London, Ont.
J. B. Walton, McClary Mfg. Co., London, Ont.
Samuel Terrill, Guelph, Ont.
H. D. Reed, Doty Engine Works Co., Goderich, Ont.
L. L. Anthes, Toronto Foundry Co., Toronto.
J. C. Armer, editor Canadian Machinery, Toronto.
A. E. Pipher, Sanitary Ideal Mfg. Co., Port Hope, Ont.
J. K. Moffat, Moffat Stove Worvs, Weston, Ont.
Arthur W. White, Geo. White Sons' Co., London, Ont.
Geo. A. Burman, King Radiator Co., Toronto.
F. H. Stoneman, Wortman & Ward Mfg. Co., London, Ont.
R. J. Cluff, King Radiator Co., Toronto.
E. B. Fleury, Hamilton Facing Mills Co., Hamilton.
W. J. Thompson, Hamilton Facing Mills Co., Hamilton.
H. V. Tyrrell, manager Canadian Machinery, Toronto.
Wm. Yellowlev, Canadian Locomotive Co., Kingston, Ont.
Robert Agnew, Canadian Locomotive Co., Kingston, Ont.
J. S. Taylor, Paris, Ont.
Wm. Surdam, Smith's Falls, Ont.
J. R. Nichol, Smith's Falls, Ont.
J. P. Hockin, Taylor-Forbes Co., Guelph, Ont.
Geo. C. Wilson, Taylor-Forbes Co., Guelph, Ont.
A. J. Calv Pease Foundry Co., New Toronto, Ont.
A. G. Storie, Ontario Malleable Iron Co., Oshawa, Ont.
J. S. Storie, Oshawa Steam & Gas Fitting Co., Oshawa, Ont.

Group of Delegates at Convention of American Foundrymen, Philadelphia, May 20-24.

F. G. Trull, Ontario Malleable Iron Co., Oshawa, Ont.
G. S. Trubell, Empire Mfg. Co., London, Ont.
A. J. Palmer, Empire Mfg. Co., London, Ont.
J. H. McGregor, Galt, Ont.
H. Hertfelder, Dodge Mfg. Co., Toronto.
W. G. Reid, Toronto.
A. H. Tallman, Tallman & Sons., Hamilton.
Robert Hunter, Goldie & McCulloch Co., Galt.
N. K. B. Patch, Toronto.
R. J. Hopper, Brantford, Ont.
G. W. Duecharme, Montreal.
J. A. Lagnon, Montreal.
Geo. H. Weaver, Dominion Foundry Supply Co., Montreal.
Kenneth Falconer, Gunn, Richards & Co., Montreal.
T. Ben. Bennett, D. Maxwell & Sons., St. Marys, Ont.

Among the Canadians present who did not register were :—E. C. Gurney, Gurney Foundry Co., Toronto; J. Wright and P. McMichael, Dominion Radiator Co., Toronto.

Aims and Objects of the Association.

This shows what an interest Canadians take in the American Foundrymen's Association. The holding of the convention in Toronto next year will result in increased interest. For the benefit of those who are not acquainted with the association, it may be well to discuss its aims and objects.

The American Foundrymen's Association was organized at Philadelphia ten years ago with the purpose in view of placing founding on a higher industrial plane. Its aims are purely educative. To Dr. Moldenke is due the chief credit for the success which the association has had. Of late years there have been affiliated associations formed—the Foundry Supply Association, the Associated Foundry Foremen and the newly organized Brass Founders' Association. Each year a convention is held at which papers pertaining to foundry practice are read and discussed, and at which the Supply Association make exhibits. This convention provides an opportunity for the foundrymen to meet in social intercourse, to exchange ideas and to become familiar with all the latest machinery and appliances which are placed on the market.

The advancement in the founding industry in the least ten years is due in no small measure to the work of the American Foundrymen's Association.

This Year's Convention Most Successful.

The convention at Philadelphia this year has been a most successful one. The papers presented to the association were good. The movement to organize an affiliated brass association was successful. The exhibit of foundry machinery and foundry supplies was the best that has ever been made in America.

Group of Canadians at Convention of American Foundrymen.

Officers of Foundrymen's Association.

The officers of the American Foundrymen's Association for the ensuing year are as follows:

President, S. G. Flagg, Jr.

Vice-president, 1st district, C. J. Caley.

Vice-president, 2nd district, John S. Burr.

Vice-president, 3rd district, H. E. Field.

Vice-president, 4th district, J. H. Whiting.

Vice-president, 5th district, A. K. Beckwith.

Vice-president, 6th district, T. W. Sheriff.

Vice-president, 7th district, J. P. Golden.

Vice-president, 8th district, L. L. Anthes.

Secretary-treasurer, R. Moldenke.

The officers of the Associated Foundry Foremen for the coming year are as follows:

President, James F. Webb, Lake Shore & Michigan Southern Railroad shops, Elkhart, Ind.

First Vice-president, W. S. McQuinnin, Allegheny Foundry Company, Warren, Pa.

Second Vice-president, W. O. Steele, Bateman Mfg. Company, Grenlock, N.J.

Secretary and Treasurer, F. C. Everitt, J. L. Mott Company, Trenton, N.J.

Under the constitution of the Associated Foundry Foremen the presidents of the local associations become vice-presidents of the national association. These are the following: W. F. Brunan, Erie, Pa.; Thos. Glasscock, Milwaukee, Wis.; E. W. Smith, Chicago, Ill.; Hugh McPhee, New York, and other eastern territory; W. A. Keller, Indianapolis, Ind.; Hugh McKenzie, Cleveland, Ohio; W. A. Perrine, Philadelphia, Pa.; David Reid, Hamilton, Ont.; H. J. Holmes, Cincinnati.

Hugh McPhee, the retiring president, was elected an honorary member of the association. A committee was appointed to revise some portions of the constitution and by-laws, and the changes will be submitted to letter ballot.

Officers of Brass Association.

The officers of the Brass Founders' Association, formed at this convention, are as follows:

President, Charles J. Caley.

Secretary, Andrew M. Fairlie, Philadelphia.

Treasurer, J. H. Sheeler.

Officers of Foundry Supply Association.

The newly elected officers of the Foundry Supply Association are as follows:

President, E. H. Mumford, E. H. Mumford Co., Philadelphia.

1st Vice-president, W. P. Shepard, Rogers, Brown & Co.

2nd Vice-president, W. S. Quigley, Rockwell Engineering Co.

3rd Vice-president, H. E. Atwater, Osborne Mfg. Co.

4th Vice-president, Wm. Chambers, Garden City Sand Co.

Treasurer, J. S. McCormick, J. S. McCormick Co.

Secretary, H. M. Lane, Cleveland.

Trustees—W. E. Kanavel, Interstate Sand Co.; E. J. Woodison, Detroit Foundry Supply Co.; W. J. Thompson, Hamilton Facing Mills Co.; F. W. Perkins, Arcade Mfg. Co.; and Geo. Rayner, the Carborundum Co.

Notes of the Convention.

The convention was a famous success. The exhibits of the Supply Association were the best ever made.

* * *

Dr. Moldenke and H. M. Lane were hard-worked men. They worked day and night and night and day.

* * *

Joseph A. Walker, vice-president of the Joseph Dixon Crucible Co., died during the convention.

* * *

The shad dinner at Washington Park will long be remembered.

* * *

A feature of the after-smoker musical performance was the singing of the Canadian national anthem by a number of enthusiastic Canucks.

* * *

Canadians were in evidence everywhere, and at all times Canadians make themselves felt wherever they go.

EXHIBITS OF SUPPLY ASSOCIATION.

A splendid exhibit was made by the Supply Association, each member doing his share to contribute to the splendid effect. Practically all the exhibits were educative. Nearly all were in actual operation. There were a large number of new machines shown and new ideas brought out. Moulding machines and core-making machines were the features of the exhibition. Quite a study could be made of the different principles involved in the machines; and there was ample opportunity afforded to judge of the relative merits of each. There were also many other new features of decided interest.

W. W. SLY MFG. CO.—A complete exhibit of tumbling barrels, cinder mills, dust arresters, core sand separators, resin grinders and other foundry equipment. One of the features of the exhibit was the burnt sand cleaner. This machine is illustrated and described in another part of this issue. The exhaust tumbling barrels have some important features, among them being unlimited guarantee as to strength and wearing qualities of the pinions and bearings, the automatic opening and closing of the damper in the exhaust pipe as the barrels are thrown into and out of commission. The dust arrester was also an attractive part of the exhibit. This arrester exhausted dust from the tumbling barrels, and expelled the clean air.

DETROIT FOUNDRY SUPPLY.—Represented by E. J. Woodison, L. A. Crandall and W. R. Beers. Owing to the going astray of shipment they were unable to show their complete exhibit, which was to have consisted of foundry supplies, the Crandall cupola and furnaces. Mr. Woodison was influential in having the exhibit in Toronto next year. During the convention the company sold all the apparatus they had on exhibit, as well as several Crandall cupolas. This firm distributed a neat souvenir, consisting of a pocket-book.

GUNN, RICHARDS & CO.—Represented by Kenneth Falconer in the interests of costs systems.

C. DRUCKLEIB.—Exhibit of sand blast apparatus for cleaning castings. This apparatus differs from other sand blast apparatus in its application of sand at three different points by means of special jets working in unison. These machines are made in Canada by the Canadian Rand Co.

CHICAGO PNEUMATIC TOOL CO.—Represented by G. A. Barden, B. H. Tripp, F. C. Severin, J. M. Towle, W. H. S. Bateman, H. B. Griner, P. R. Severin and Howard Small. They had a comprehensive exhibit of pneumatic machinery.

HANNAH ENGINEERING WORKS.—Represented by W. L. Laib. The exhibit consisted of shakers and pneumatic riveters. The shaker has several distinctive features.

CLEVELAND WIRE SPRING CO.—Represented by J. W. Campbell and C. H. Erricson. Exhibit consisted of steel barrels and boxes for handling small castings in the foundry, and for similar purposes in a manufacturing plant. Souvenir, a neat note book.

OSBORNE MFG. CO.—Represented by H. R. Atwater, vice-president; F. D. Jacobs, sales manager; C. V. Jacobs, J. C. Boyton. They had a splendid display of their line of goods, brushes and other foundry supplies, in the form of pyramids. Their souvenir, hat and clothes brushes.

LINK BELT ENGINEERING CO.—Represented by Arthur D. Shaw and T. B. O'Neil. The exhibit consisted of a conveying machine for handling sand, coke, etc., in the foundry. This is a demonstration of the case of handling materials in the foundry with suitable appliances. The Reynold silent chain was included in the exhibit.

J. W. PAXON.—Represented by I. F. Kreiner, designer of exhibit; E. M. Taggart, J. Goehring, J. H. Joulin, Canadian and New England representative; M. Carr, A. G. Warren, M.E.; H. M. Bougher, treasurer and advertising manager; Howard Evans, vice-president, and Geo. Moore, moulding machine man. Largest exhibit in the building, consisting of all kinds of foundry supplies, including the New Glenwood Rocvover moulding machine. An exhibition of the manufacture of brushes and sieves was given. Souvenir, a pair of dividers.

ARCADE MFG. CO., Freeport, Ill.—Three moulding machines, equipped with different styles of pattern plates, showing the different styles of work which is handled by these machines. Neat pin tray as souvenir.

BERKSHIRE MFG. CO., Cleveland, O.—Standard Berkshire moulding machines in operation, moulding radiators, hot water pipes, etc. Puzzle match-box as souvenir.

PH. BONVILLAIN & E. RONCERAY, Paris.—Exhibited a full line of their universal moulding machines in operation, with several styles of pattern plates. There was also shown several styles of intricate castings made from their moulds.

CYRUS BORGNER, Philadelphia.—Fire brick and other foundry supplies.

A. BUCH'S SONS CO., Elizabethtown, Pa.—Exhibit of moulding machines.

CAMDEN COKE CO., Philadelphia.

CORTLAND CORUNDUM WHEEL CO., Cortland, N.Y.,—Exhibit of grinding machines. Souvenir, grinding stone in leather case.

CROCKER-WHEELER CO., Ampere, N.J.

DIAMOND CLAMP AND FLASH CO., Richmond, Ind.—Exhibit of three styles of core machines, with which a very varied style of core can be made. Representatives are: W. N. Gartside and Jos. H. Gartside, traveling representative.

JOSEPH DIXON CRUCIBLE CO., Jersey City, N.J.—Represented by A. L. Haasis, W. J. Coane, Neville Roane, W. A. Housten and Frank Krug. A fine display of crucibles. Souvenir, a box of pencils.

STANLEY DOGGETT, New York.—Exhibited "Perfection" parting compound.

EDWARD J. ETTING, Philadelphia.—An exhibit of cupolas, tumbling barrels, ladles, etc., and a magnetic separator.

FALLS RIVET & MACHINE CO., Cuyahoga Falls, Ohio.—Exhibit of the Wadsworth core making machinery including the improved core machine,; and also the new Wadsworth core ovens, which have but recently been placed on the market. There was also shown a gagger mould and a friction drive tumbling barrel. Souvenir, a cigar case.

FOX MACHINE CO. Grand Rapids, Mich.—Exhibit of Fox trimmers.

FOUNDRY SPECIALTY CO., Cincinnati, Ohio.—Practical demonstrations were made of the use of a new line of compounds for parting and facings for brass and iron work.

THE GARDEN CITY SAND CO., Chicago.—An exhibit of samples of a complete line of mounding sands.

THE GOLDSCHMIDT THERMIT CO., New York.—There was demonstrated the use of thermit for various purposes to which it is put, including welding, repair of large castings, purification of iron in the ladle, etc.

EDWIN HARRINGTON, SON & CO., Philadelphia.—An exhibit of Peerless hoists, for use in foundries.

HERMAN PNEUMATIC MACHINE CO., Zelienople, Pa.—An exhibit of three different styles of moulding machines, together with samples of work which had been done with them.

A. E. HOERMANN, New York.—An exhibit of sand blast apparatus and a complete line of Green pneumatic hammers, sand rammers, etc.

THE INTERSTATE SAND CO., Cleveland, O.—An exhibit of foundry sands. Souvenir, handsome watch fob.

KILLING MOULDING MACHINE CO., Davenport, Ia.—Represented by E. J. Potter and M. K. Weigel. An exhibit of moulding machines and automatic steel clasps, floor plate, steel flasks and new power-driven sand riddle. Souvenir, a handsome paper weight and dice box.

ARTHUR KOPPEL CO., New York.—An exhibit of the industrial railway system. Souvenir, note book.

W. W. LINDSAY & CO., Philadelphia.—A complete line of foundry chaplets, etc.

MACPHAIL FLASK & MACHINE CO., Chicago.—An exhibit of steel flasks and a new type of galvanized sheet steel bottom board.

C. E. MILLS OIL CO., Syracuse, N.Y.—An exhibit of core oil and Mills Day core compound.

MITCHELL-PARKS MFG. CO., St. Louis.—Exhibit of their gravity moulding machine in operation.

MONARCH EMERY & CORUNDUM WHEEL CO., Camden, N.J.—Exhibit of emery and corundum wheels.

MONARCH ENGINEERING & MANUFACTURING CO., Baltimore.—Exhibit of a tilting furnace, a Monarch blower, a ladle heater, and other foundry supplies.

E. H. MUMFORD CO., Philadelphia.—An exhibit of moulding machines and their new Mumford sand supply and screening apparatus for moulding machines.

J. S. McCORMICK CO., Pittsburg.—An exhibit of moulding machines, the Dings magnetic separator, the McCormick continuous sand mixer and other foundry supplies.

S. OBERMAYER CO., Cincinnati.—Represented by J. T. Thorner, vice-president,; S. T. Johnston, J. E. Evans, W. M. Fitzpatrick, C. M. Goldman, E. D. Frohman. Showed a new line of foundry ladles.

OLIVER MACHINERY CO., Grand Rapids, Mich.—A Universal saw bench, a band saw, and a trimmer.

OTTO GAS ENGINE WORKS, Philadelphia.—Their horizontal gas engine supplied power to the various exhibitors.

THOS. W. PANGBORN CO., New York.—An exhibit of foundry supplies, including sand

blast apparatus, core machines, and sand sifters.

PETTINOS BROS., Bethlehem, Pa.—An exhibit of lubricating and crucible flake graphites, foundry dust, blackings, etc., and various grades and styles of plumbago.

HENRY E. PRIDMORE, Chicago.—Exhibit of four moulding machines, two of the rock-over drop type, and two standard stripping plate machines.

RANDALL TRAM RAIL CO., Philadelphia.—An exhibit of the Moyer tram rail system.

ARTHUR E. RENDLE, New York.—Exhibit of skylights and fireproof windows.

ROCKWELL ENGINEERING CO., New York.—An exhibit of the Rockwell melting furnace.

J. D. SMITH FOUNDRY SUPPLY CO., Cleveland.—An exhibit of foundry supplies, including the new sprue cutter and Cleveland moulding machines. Souvenir, handsome memorandum case.

P. H. & F. M. ROOTS CO., Connersville, Ind.—An exhibit of foundry blowers.

R. B. SEIDEL, INC., Philadelphia. Exhibit of crucibles. Souvenir, watch fob.

SMYTH SWOBODA & CO., New York.—An exhibit of the "Lycropart" parting.

STANDARD SAND & MACHINE CO., Cleveland.—An exhibit of their continuous automatic sand and mixing machine.

THE TABOR MANUFACTURING CO., Philadelphia.—An exhibit of the Tabor moulding machine and the Taylor Newbold saws.

B. F. STURTEVANT CO., Hyde Park, Mass.—An exhibit of their high pressure rotary type blower, the interior of which was shown by the blower being partly dismantled. There were also shown various other styles of blowers.

U. S. GRAPHITE CO., Philadelphia.—An exhibit of graphite products. Souvenir, a set of playing cards.

THE WHITING FOUNDRY EQUIPMENT CO., Harvey, Ill.—Furnished space for the reception and entertainment of friends and guests.

THE WILBRAHAM, GREEN BLOWER CO., Philadelphia.—An exhibit of foundry blowers, motor driven.

YALE & TOWNE MFG. CO., New York.—An exhibit of their portable electric hoists and their triplex, duplex and differential train blocks in operation.

Points about Compressors and Pneumatic Tools

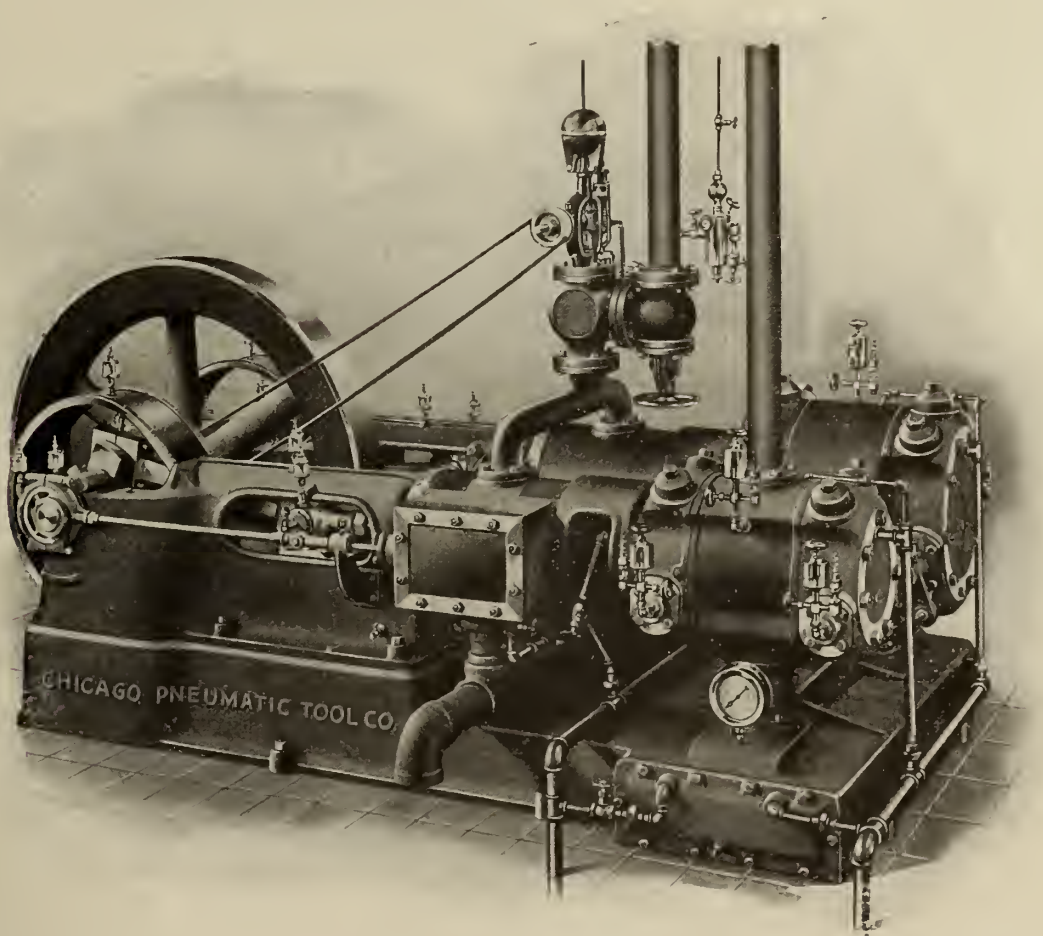
The Field of Compressed Air; Interesting points concerning Compressors; Care of Pneumatic Tools.

By W. P. Bissinger, Chicago Pneumatic Tool Co.

During the past five years much progress has been made toward standardizing operations with air tools, hitherto accomplished by different means in different shops; also we are witnessing the realization of prophecies regarding the extension and widespread use of air power that seemed wildly extravagant when they were made. From the air brake pump to the Corliss compressor is a wide span, yet we have seen the air power plant develop from one to the other during the past ten years.

I shall merely mention in passing the familiar applications of the air hammer for chipping, riveting, scaling, or any service demanding a rapid, hard, percussive blow; the air motor for drilling, reaming, flue rolling, turning car journals, or any kind of work requiring rotative power—the air hoist, either in the form of a motor or straight lift cylinder and piston. Likewise the pneumatic jack, the sand blast, the stay bolt nipper, the paint burner and the paint sprayer, the air cleaning nozzle and numerous other special uses devised for this readiest of powers.

In the early days of air utilization much was heard about the rivalry between pneumatic power and electricity for transmitting energy from its source



Air Compressor with Mechanically Operated Intake Valves

of inception to its point of consumption and each had its votaries and advocates more or less extreme in their partisanship.

To-day each has found its recognized and legitimate sphere of usefulness, and frequently both forms of power are made to co-operate in the achievement of the best results.

Compressors Now More Efficient.

It is natural to expect that larger compression units would produce compressed air with less relative expenditure of power, since the opportunity exists for refinement of design and construction not possible in the smaller compressors. But so great has been the demand for a reduction in the cost of compressed air production that contemporary compressors in all sizes are vastly superior to the earlier patterns in use when air tools were first introduced. This has been accomplished through an intelligent appreciation by the builders of air compressing machinery of the more arduous service which compressors undergo, to which they have responded by designing machines adequate in weight, strength, bearing surface, valve areas, and automatic regulation, to the severer conditions. Users of compressed air in the selection of their compressors have contributed an influence equally beneficial by exercising a discriminating knowledge and judgment (expensively obtained at the school of experience) which they did not possess when compressors first supplanted air brake pumps.

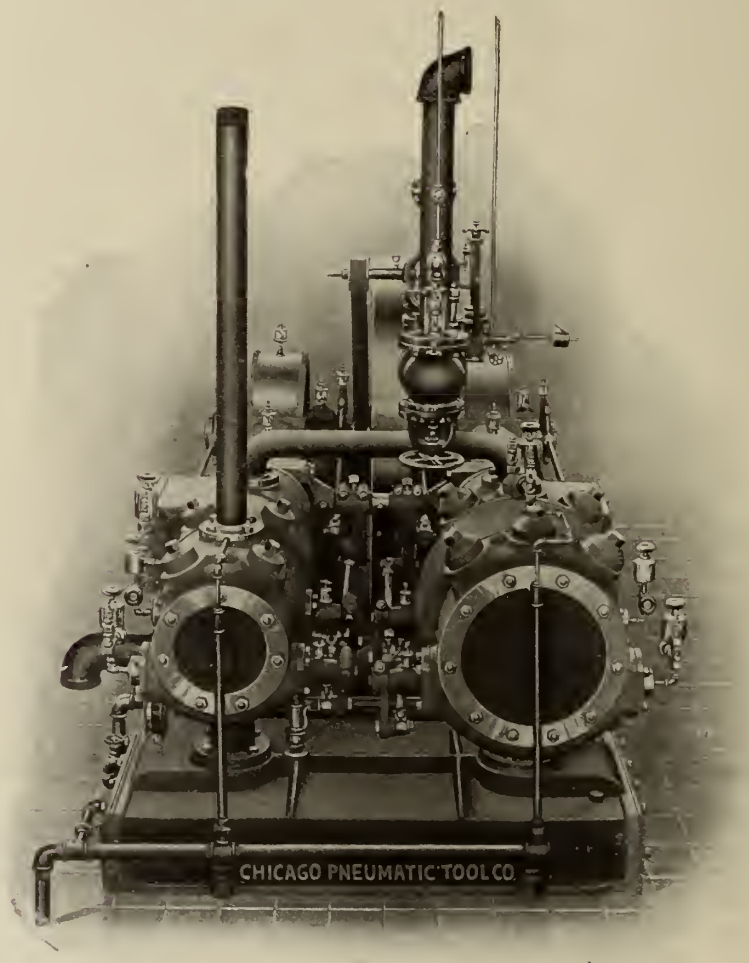
Evil of Overrating Compressors.

An evil to which not over-scrupulous compressor builders have contributed is the over-rating of compressor capacities. As is well known, compressors are rated according to their piston displacement, being the cylinder area multiplied by the piston speed. From this result deductions due to clearance losses and heat expansion must be made to arrive at the actual volume of air delivered. These losses necessarily vary according to the quality of the machine, emphasizing the inevitable conclusion that greater initial investment pays a handsome dividend.

Beyond an arbitrary limit, however, compressor ratings at high speeds mean nothing but deception, since greater displacement than the air valve area permits is not possible even if structural strength and bearing surface are adequate, which they rarely are.

Experienced compressor users realize thoroughly the desirability of providing machines of size sufficient to deliver the requisite yield at moderate working speed, reducing cost of maintenance and greatly prolonging the life of the machine.

But while these recent prosperous times have enabled a great betterment of compressor equipment, there is much yet to be accomplished. There still remain air brake pumps in use supplying shop requirements and plants with compressors inadequate or obsolete, or both, are still altogether too numerous. An investigation applied to individual conditions would develop results so surprising as to overcome all ordinary objections to the increased investment, and instances where compressors have been shown to earn their cost within one to two years after installation are by no means rare.



End View of Compressor with Mechanically Operated Valves.

Compressors Driven by Steam Engine, Electric Motor and Gas Engine.

For railroad shops and industrial establishments the steam driven compressor is of course most generally employed, though many more motor driven compressors are used than formerly, conditions being favorable.

The demand is steadily growing for compressors of moderate capacity for use where steam to drive them is not available. Motor driven compressors meet this requirement if electrical current is obtainable and gasoline engine driven compressors where neither steam nor electricity may be had. Such machines are highly useful for maintenance of way and bridge construction and repair at junction points. The necessity of testing the air brake equipment of cars received from other lines has also created a comfortable demand for self-contained gasoline driven compressors with engine and compressor mounted upon one bed, the engine driving the compressor by gear or silent chain.

Compressors up to 200 cubic feet per minute capacity for a terminal air pressure of 100 lbs. per square inch are usually of the single cylinder type, double acting in that they compress air at each of the strokes, displacing the cylinder contents twice per revolution. Above 200 cubic feet per minute two stage compressors show an economy that should not be disregarded. Formerly duplex compressors having two simple compressing cylinders were common, but except for low air pressures, that do not warrant compounding, these have been superseded by the two stage type.

The steam cylinders have balanced slide valves, with independent adjustable cut-off usually provided for cylin-

ders of twelve inches diameter or larger. Steam cylinders are compounded generally when the steam pressure at throttle is sufficient to warrant. The limit of capacity at which the Corliss valve should supplant the slide valve varies according to the appropriation available and the cost of fuel. However, Corliss compressors of 1,500 and 2,000 cubic feet per minute capacity are much more frequently installed than formerly.

Wasted Air Means Wasted Money.

Effectual measures should be adopted to prevent the useless waste of compressed air, so frequently encountered in shops. Since the atmosphere we breathe is free, its value when compressed, represented by the cost of maintenance of plant and power expended in compressing it, is too lightly regarded, with the result that it becomes a favorite means of blowing dust from machines, work benches and garments, and a plaything in the hands of the mischievous, frequently with dangerous and sometimes with fatal results. For cleaning armatures and delicate machinery, compressed air is often an indispensable agent, but strict orders and severe penalties should prevent its indiscriminate and unauthorized waste.

Keep Air Free From Dirt.

Dirt and grit in compressed air clogs the necessarily delicate working parts of the pneumatic tools and the inevitable excessive wear on valves and other parts causes rapid depreciation in value and power. To avoid this it is desirable to screen or filter the air at the compressor intake, but care must be observed not to have the screen of too fine a mesh or the air supply will become partially throttled. Occasional instances have occurred where compressor capacity has been markedly curtailed from this cause. As most of the air tools now sold are provided with individual strainers, trouble from dirt in the tools is not frequent. These strainers also must be kept clean or the tool will appear to have lost its power.

Lubricating Compressors and Tools.

The lubrication of compressors and pneumatic tools is a feature deserving careful attention. A too frequent mistake is made by using in air cylinders of compressors, oil intended for steam cylinders. Such oil is of low flash point, whereas the power lubrication of air cylinders demands a light oil of high flash point and of very best quality. Oil of poor grade and low flash point becomes vaporized in air cylinders and is discharged with the air without effecting lubrication.

Oil should be fed to air cylinders slowly and sparingly, as too much oil will clog the air valves, causing them to stick and give trouble. Air valves should be examined and cleaned at intervals by washing in kerosene or naphtha. When this is done the valves should be removed from the compressor. Engineers have been known to introduce kerosene through the air inlet pipe, an effective method of cleansing dirty valves, but sometimes equally effective in producing an explosion, since the oil forms a fine spray or mist which when compressed with the air produces a condition similar to that in the cylinder of an oil engine.

The plan of feeding soap suds into the air cylinder through the lubricator is excellent for keeping valves clean, but when this is done, oil should be fed through afterward to prevent rust.

The lubrication of pneumatic tools is of equal importance. One cannot do better than obtain and use one of the several brands of oil furnished by pneumatic tool makers who have made a special study of the requirements. Such oil is necessarily light, and under no circumstances should a heavy oil be used, as the cooling effect of the expanding air would cause it to clog the tool parts and prevent the free movement of the parts.

Pneumatic hammers should be carefully cleaned after using and kept submerged in a tank of oil when not in service. An excellent device for effectively lubricating pneumatic tools is an automatic oiler inserted in the supply hose about twenty inches from the tool with oil proof hose between oiler and tool, which, operating on the principle of an atomizer, enables the flow of the lubricant to be regulated to a nicety.

Equipment of Manufacturing Plants

Economy can be Effected by Correct Placing of Machinery.
By G. C. Keith, B.A.Sc.

In erecting a building for the manufacturing of a certain machine or article, too much care cannot be taken to construct the building to suit the work. An architect should be engaged who is thoroughly conversant with the character of the work. Heads of departments should be brought together and schemes decided upon. This should also be done in the placing of the machinery. The equipment is of more importance than the building, and the proper placing of machinery should not be neglected.

Just as in locating a plant, transportation is one of the most important factors in settling on a manufacturing site, so in the shop. The machinery should be so arranged that the castings, etc., will have to be carried as short distances and handled as few times as possible. In a certain large manufacturing plant in Ontario thousands of dollars have been spent shifting and re-arranging the machinery. This not only wastes considerable time, but it is accomplished only at a large cost.

Before placing the machines, positions should be carefully studied. Every time a change is made the profits are lessened. The proper placing of machinery is a great factor in keeping up the efficiency of the plant.

Work Should be Standardized.

As soon as possible the work should be standardized. Gauges should be made as well as jigs to assist in quick manufacturing. A toolroom is necessary, well equipped with good machinery and first-class men. Here the plans are made for the best way to do any special job, and jigs are made for the work.

In some machine shops it has always been the rule: "One machine—one tool —one man," but shop superintendents and foremen should recognize that a great saving is accomplished by doubling up. For this reason we now have one-headed planers replaced by those with four heads; we have the automatic nut-tapping and screw-cutting machines with three and four heads, and we have the turret-lathe.

Let me cite the saving there is in roller bearing tie-pins alone by the use of the automatic turret-lathe. In one machine shop it takes a boy, working at the rate of about five cents a hundred, milling the ends of the tie-pins. He puts them in a jig, one at a time, tightens it up and forces it into a revolving mill by means of a lever, doing one end and then the other. He must then loosen the jig to take the pin out. Before the milling can be done a man must cut off the pins in lengths in the shears. Now let us look at a different shop. Here twelve automatic turret-lathes stand in a row. The wire for the pins is fed into the machine from a coil, the ends are milled for the rings and the pins are cut to their proper length. These twelve machines are looked after by one man.

Where there are thousands of small articles to be made, as in some sewing machine, bicycle and agricultural works, such machinery is essential. Such an installation costs considerable, but the saving effected much more than pays the interest on the investment.

Tricks of the Trade

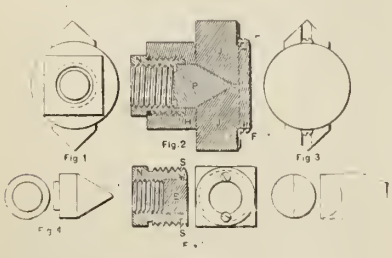
Send in your ideas, sketches or jobs you are doing, and anything of interest to your fellow-workmen. Remuneration will be made for such contributions.

WAYS AND MEANS OF DOING THINGS

STUD HOLDER FOR BOLT CUTTING MACHINE.

The accompanying cut shows a stud holder intended to hold short studs in a bolt-cutting machine when one end of the stud has already been threaded. Referring to the cut, Figs. 1 and 3 show end views and Fig. 2 a sectional view of the device. The body (H) is made of machine steel, and is first drilled crosswise to receive the jaws (J), shown in Fig. 6. These jaws are made in one piece and fastened in place by the screws (FF). Then the body with this piece in place, is chucked and bored out for the plunger (P), a detail of which is shown in Fig. 4, and is, at the same time bored and threaded for the machine steel bushings (N). After this is done, the jaws are taken out, cut in two, and the slots for the screws (FF) made a little longer to allow the jaws to freely adjust themselves to the plunger point. The jaws and plunger are made of tool steel and hardened. The square bushings shown can be made of square cold rolled stock and the body of the same kind of round stock, no outside finish being necessary.

The assembled sectional view shows a bushing for 1-inch studs. Fig. 5 shows a bushing for ¾-inch studs. The inside end of the bushing is counterbored for the button (E), which is a hardened tool steel piece held in place by the two screws (SS), which prevent it from falling out, but allow it to slide in about 1-16-inch, the same as the plunger slides in the 1-inch bushing. The threads on the insides of the bushings on all sizes are made the length of the diameter of the stud. The stud to be cut is screwed



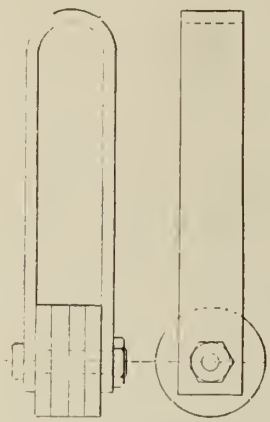
Stud Holder for Bolt Cutting Machine.

loosely down against the plunger (P) or the button (E), as the case may be, and the jaws of the vise tightened up against the jaws of the holder, which, in turn, force the plunger and, in sizes smaller than 1-inch, the button against the end of the stud, locking it, and also securing the holder in the vise. Opening the vise allows the button, plunger and jaws to go back to their former places, and the stud can be easily removed.

M. H. BALL, in Machinery.

EMERY WHEEL DRESSER.

The cut herewith shows a simple emery wheel dresser made from an ordinary bent piece of band iron with four or five tool steel washers between the ends. A small bolt passes through the washers and the band iron holding it together. If the wheels of an ordinary dresser are worn out ordinary tool steel washers may be inserted as these will last just as long and are a great deal cheaper

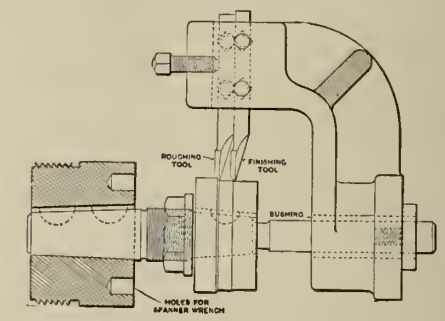


Emery Wheel Dresser.

than the wheels bought especially for the purpose.—Roy B. Demming, in Machinery.

TURRET TOOLS FOR ROUGHING AND FINISHING PINIONS.

The cut herewith shows a tool which I designed recently for turning and facing pinions on a Warner & Swasey screw machine. It consists of a cast iron overhanging arm carrying a roughing and finishing tool attached in the ordinary way to the turret with two bolts. A cast iron head fitted to the spindle holds the arbor on which the pinion is turned. This arbor is made of tool steel, hardened and ground, and fitted with Woodruff keys, as shown, to prevent the arbor and pinion from turning on the seat while the cuts are taken. The bushing shown in the arm steadies the arbor during the operation. The hole for the bushing was bored in the machine, bringing it perfectly in line. The tools used are 1 x ½-inch high speed steel cutters. The nut shown is for backing off the pinion after the job is



Turret Tools for Roughing and Finishing Pinions.

completed. The pinions are first chucked in the same machine, bored, and reamed with a taper reamer. They are then faced on the end with a tool in the cross slide, after which they are put on the fixture shown and turned. Afterward they are faced on the other end to the proper length with a tool in the cross slide.

C. W. PUTNAM, in Machinery.

EDUCATION AND THE TRADES.

In his last annual message, President Roosevelt said:

"It should be one of our prime objects as a nation, so far as feasible, constantly to work toward putting the mechanic, the wage-worker who works with his hands, on a higher plane of efficiency and reward * * * Unfortunately, at the present, the effect of some of the work in the public schools is in the exactly opposite direction. If boys and girls are trained merely in literary accomplishments, to the total exclusion of industrial, manual, and technical training, the tendency is to unfit them for industrial work and to make them reluctant to go into it, or unfitted to do well if they do go into it."

Words coming from the lips of so great a publicist as President Roosevelt and delivered on such a significant occasion, have a pregnancy well worth our consideration. In the above quoted words the President is calling the nation's attention to an ominous fact, that of the scarcity of skilled and experienced mechanics and the inadequacy of machinery for training them. As

citizens of America we have been very slow to see this fact. We are just now beginning to realize the gravity of the situation.

In a large majority of cases where applicants for any vacant position are asked for, the demand is made that the applicant state his experience. Hitherto, many bright, ambitious and capable boys, who, though having no experience in the trade in which they wish to enter, are willing to start "at the bottom of the ladder," if even they may secure a start in that particular trade, are discouraged by being "turned down" because of the company's rigid insistence upon the experience principle. President Roosevelt, readily realizing the distressing vicissitudes of fortune in every vocation, whether profession or trade, went to the root of the question by putting his finger on the public school system. He justly deplored the undue attention given in the schools to "training in merely literary accomplishments, to the total exclusion of industrial, manual, and technical training."

In such an age as ours, when the mechanical spirit is abroad, it is a gross absurdity to preclude the possibility of children, who have not sufficient mental capacity to make a success of any profession of earning the necessities of life through some trade, by training them in merely literary accomplishment, entirely losing sight of the fact that those entering trades need as much training and preparation as the others. It is to be sincerely hoped that such an unhappy illusion as the one just named will be speedily dispelled. Such illusions prove disastrous to the prosperity and welfare of a nation.

Men before President Roosevelt, however, saw the necessity of establishing schools wherein to give boys experience in their chosen trades before actually entering the manufactories, thereby better equipping them for their trades and increasing the possibility of rapid promotion. Such schools are in successful operation in some of the larger centres of population in the United States, New York, Boston, Pittsburg, Philadelphia, Indianapolis, and Springfield, Mass., have their free evening trade schools. As will be noticed, the sessions of these schools are held in the evening, and are meant primarily to prepare boys of sixteen years and up, who have left school, to enter the trades. The teachers are men actually engaged during the day in mechanical work and thus well fitted to train the boys. So far, these schools have proved to be invaluable factors in enhancing the commercial conditions of the republic. They are largely attended, the one opened in Philadelphia this year having an attendance of over five hundred.

The central aim of all successful educators has been, and is, to make all education concrete and practical. The predominant materialism of our age demands it. In the city of Toronto we have two large schools which emphasize pre-eminently the practical side of education. The Technical School and the School of Practical Science* are model institutions. They do a splendid work in their own fashion, but they do not go far enough. Technical instruction has reached a very high standard of perfection in these schools. Their work would be more universally satisfactory if mechanical instruction was introduced and imparted. It is a notable fact that college—and school—trained mechanics often make deplorable failures when it comes to applying the training and knowledge they have acquired to actual and real conditions. In a conversation with a mechanic of five years' experience the other day, the present writer was told that the experience of a man in the shops was eminently preferable to the training gotten in a technical or science school. The mechanic told an incident of a young man "just out of college with all his diplomas," being assigned a certain work in the shop where he worked. After a great deal of work with discouraging results, the college-trained mechanic came to the manager and acknowledged his inability to satisfactorily complete the work.

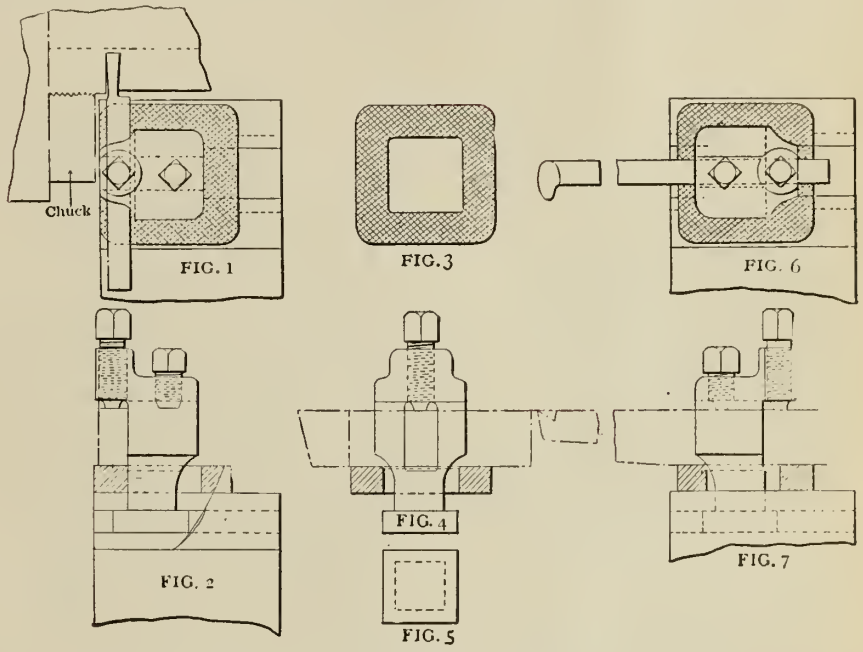
Would it not have been eminently better for that young man if he had had the privilege of attending a trade school such as are in successful operation in the United States and gotten his training from men actually engaged in the trade instead of from college professors so well versed in theory but in a number of cases so deficient in practical training. Our educational system is a practicable system; let us strive to make it more practicable by collaborating in the establishment of trade schools, and give encouragment and aid to those boys who have been "turned down" because of inexperience.

READER.

AN IMPROVED TOOL POST.

The illustration shows a lathe tool post that possesses decided superiority over any now in common use.

Figs. 1 and 2 show a square-nose tool



An Improved Tool Post.

fimly held within 1-16 inch of the chuck jaws. Fig. 3 is the tool-post ring.

Figs. 4 and 5 show the square end of the tool post a good sliding fit in the tool slide, permitting any of the four sides to face the work.

Figs. 6 and 7 show a boring tool that cannot slip.

The advantage shown in Fig. 1 where a parting tool could work within 1-16 inch of the chuck jaw is quite sufficient even alone to recommend the tool post.

I have seen many parting tools, square-nose and thread tools, that had been broken simply because the tilting gib caused the tool to lose its side clearance; these tools were all of the off-set type.

Offset tools are a poor make-shift and should have no place in the up-to-date shop; nor should the tilting gib.—F. Rattek, in American Machinist.

*Our correspondents' plea for the advancement of technical and mechanical knowledge is a worthy one. This subject is now receiving great attention from all quarters. But distinction should be made between trade schools and schools or colleges of Applied Science. The School of Practical Science is a misleading name. It is now, however, the Faculty of Applied Science of the University of Toronto. Its purpose is to give a thorough training in mathematics and applied science to fit one to take up one of the branches of engineering. There is no pretense of giving a practical training.—(Editor.)

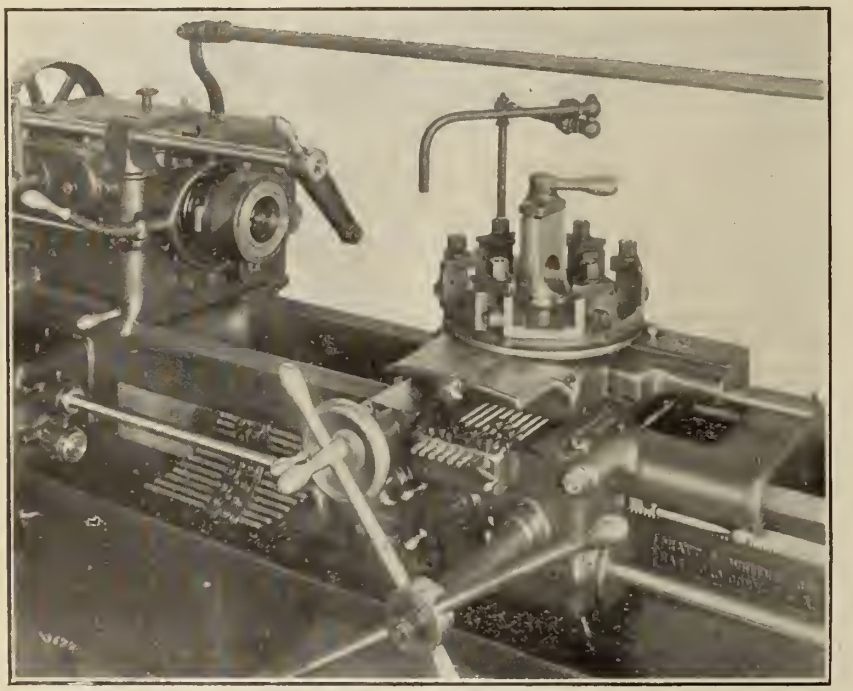
Developments in Machinery

Metal Working Wood Working ***Power and Transmission***

NEW TURRET LATHE.

The new Pratt & Whitney 2½ x 26 in. open turret lathe is a universal machine suitable for doing a great variety of work from the bar and on forgings and castings, without continually requiring special appliances and expensive cutting tools. To accomplish this purpose many new features, including a cross sliding turret, have been introduced.

This machine possesses practically all the flexibility and adaptability of the engine lathe. The extreme rigidity, powerful spindle drive, quick changes of speeds and feeds, heavy cross feeding



New Pratt & Whitney Turret Lathe.

turret and numerous adjustable stops, admit of narrower limits of error, as well as a marked reduction in the cost over work produced on the ordinary turret or engine lathe.

This machine has a stiff head, with constant speed arranged for either direct-connected motor or countershaft drive by means of a single pulley. The turret is mounted on a slide, having both positive power and hand longitudinal and traverse directions. The machine is recommended for bar work up to 2½ in. diameter by 26 in. long, for castings up to 14 in. diameter and for cylindrical operations on work within these dimensions.

An unusually heavy spindle of special steel, with cylindrical bearings, runs in bronze split sleeves. The thrust of spindle is against an independent upright, cast solid with the head, and insures against any springing tendeney under heavy end cutting strains. Provision is made for taking up wear of spindle and end thrust.

The direction and variation of the spindle to the work holding spindle are obtained by levers operating friction clutches. It is impossible to connect more than one set of gears with the spindle and main driving shaft at the same time.

The gears are of extra heavy pitch and of ample width to safely withstand the hardest usage. The head, which is stationary, is of box construction, the gears running continually in oil.

Eight variations of speed are provided and by using the two-speed countershaft this may be doubled. All of the controlling levers and connections are within easy reach of the operator. The spindle can be instantly stopped by movement of any lever on head stock.

The rod chuck may be operated while machine is running and has extraordinary gripping power.

The collet jaws are supported up to their outer end, which is particularly desirable in forming work from the cross slide.

The complete chuck can be readily removed from the spindle when combination lathe chucks or special face plates for castings are to be substituted.

A positive screw feeding device automatically feeds the rod forward to its stop.

The bar may be round, square, hexagon, or any irregular cross section, and need not necessarily be free from scale, as there are no delicate parts or complicated gearing to become clogged.

A follower bar is furnished which enables short pieces of stock to be as conveniently handled as long bars, and at the same time serves to keep such pieces concentric with the spindle.

An efficient stock stop for gauging the length of stock is provided, which, when not in use, is moved forward and swung upward, so as not to interfere with the turret tools.

The turret revolves about a large conical stud held firmly in the cross slide.

The various tools may be accurately located and with rigid backing, so that the heaviest cuts can be taken without the slightest spring or backward movement. The tools are held in place by straps and are backed up by uprights cast solid with the turret. Severe tests have proved this to be a superior method of unyieldingly holding the tools against all tortional and backward strains.

The locking bolt is directly under the cutting tool and is horizontal, thereby overcoming the tendency of a vertical bolt to lift the turret from its seat.

Indexing can be accomplished at all positions of the cross slide, and is automatic, although the turret may be rotated to any position by hand.

One of the most important features in this open turret lathe is the compound turret with power and hand feeds and adjustable stops which are conveniently located.

The longitudinal turret slide travels on large raised V's, is provided with gibs its full length, and a binder which permits the slide to be firmly clamped

to the bed at any point within its travel.

The power longitudinal feed is positive in both directions, and has six changes, any of which can be instantly set by movement of lever.

There are six automatic longitudinal stops and six supplementary stops, which give two positions to each turret tool. If necessary, all twelve stops may be used for one or all tools in the turret, making it possible to effectively cover all requirements. The stops are held in a heavy steel bracket, which may be moved along the front of the bed and clamped where desired. In case it is desired to run through a few special pieces of work, the automatic stops may be dispensed with and the supplementary stops used in their place without the necessity of disturbing adjustments.

The distance from the axis of the spindle to the turret tool is altered by traversing the turret slide. This arrangement permits ample support for long bars and if machine is belt driven, gives an unvarying belt tension. Motor can be mounted on head without difficulty.

The cross slide has both hand and power feed. There are six variations of the power feed in either direction. Eight distinct adjustable cross stops are provided, which may be used in any combination desired.

Bed and pan are made in one single casting and have U-shaped cross webbing, insuring rigidity. Generous provision for oil and chips is provided.

A variety of turret tools adapted to meet practically all the various requirements are furnished with this machine to order.

THE BURKE TWO-SPINDLE BENCH MILLER.

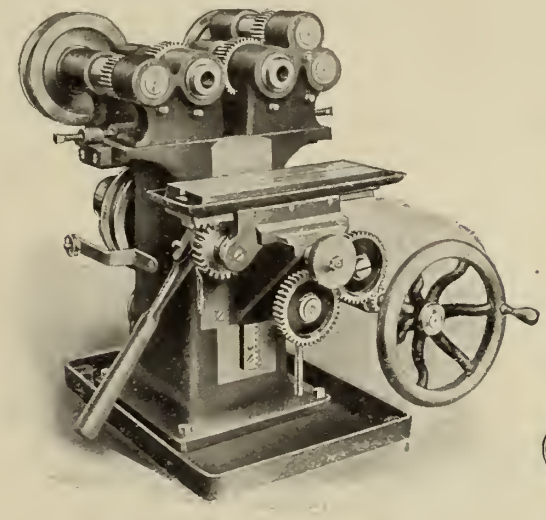
Accompanying is an illustration of a two-spindle bench milling machine which was originally built by the Burke Machinery Co., Cleveland, Ohio, as a specialty for one of the large manufacturers of typewriters, for the special purpose of milling both ends of the type bars at one time. The usefulness of such a machine for general bench work has led the manufacturers to place it on the market regularly.

The spindles rotate in different directions, so that the work can be clamped to the table and raised between the cuttters, the cutting on each end being done with a downward cut. The adjustment of the heads permits a great variety of work to be handled, not only in the millling of the two ends of a piece simultaneously, but in ordinary surface milling, where substantially the machine will have the capacity of two single millers.

The table of the miller has a longitudinal movement of 6 in., a transverse movement of 2½ in. and a vertical movement of 5½ in. The working surface of the table is 4 x 12 in. The maximum distance between the bed and the spindles is 6½ in., and the minimum distance 4 in. The largest diameter of the cone driving pulley is 6 in. and the smallest 3½ in. The spindles have holes to take No. 9 B. & S. tapers. The machine stands 25 in. high over all and weighs, complete with countershaft, about 400 lbs.

The driving pulley is on the back of the column and may be partly seen in the illustration. On the same shaft with this pulley is a large flanged pulley, which is connected by a continuous belt to the two spindle driving pulleys. The belt passes successively around one of the spindle driving pulleys, around the main driving pulley, around the second spindle driving pulley and around an idler pulley below the driving pulley back to the first spindle driving pulley. The idler is adjustable, to take up the slack of the belt caused by moving the heads. The shafts of the spindle driving pulleys carry gears which drive the spindles, on the left side directly and on the right side through an intermediate gear to give the reverse rotation to that spindle. The gears are of cast iron, the spindles of crucible steel and the bearings of phosphor bronze.

The longitudinal feed, which is used more for positioning the work than anything else, is operated, as shown in the engraving, by a ratchet lever and pinion meshing a rack on the lower side of the table. The feeding movement is usualy obtained by lifting the table vertically between the cutters, these cutters being adjustable sideways, as before stated. The table, saddle and knee are raised vertically by the hand wheel shown, which operates through gearing to drive a gear engaging in a rack on the face of the column.



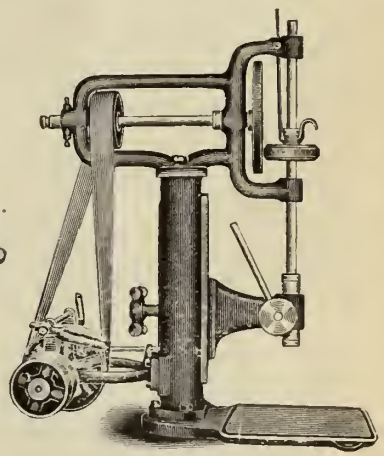
The Burke Two-Spindle Bench Miller.

All the spindle bearings are equipped with wick oilers and suitable oil boxes cast beneath the bearings. In case it should be desirable to attach weights to the knee to counterbalance it the small grooved pulleys on the side of the column are provided, over which the cords supporting the weights are hung.

FRICTION BENCH DRILL.

The accompanying illustration is of a neat and simple friction bench drill, which has been placed on the market by Krug & Crosby, Hamilton, Ont. The friction drive allows the speed to be changed instantly while the drill is in motion, which is done by releasing the screw on the stop rod and moving the friction wheel to or away from the centre of the driving disc as greater or less speed is required.

This machine will drill to the centre of 14-inch radius.



Friction Bench Drill.

HOPPES FEED WATER HEATER.

Accompanying are illustrations which show sectional views of the improved open feed water heater and purifier, made by the Hoppes Manufacturing Co., Springfield, Ohio. Fig. 1 is a side view, showing the arrangement of pans and the oil catcher. Fig. 2 is an end view, showing the delivery of the water to the feed troughs and pans. The shell of the heater is cylindrical, and the heads are "bunked," a design well calculated to resist the pressure. The feed troughs, pans and bottom of heater are made of cast iron, while the shell is made of pig iron. In vast "T" type, however, the entire shell, as well as before mentioned parts, is made of cast iron.

The normal storage of water in the bottom of the heater is shown in the end sectional view, but where more storage is desired, several layers of the bottom pans are left out and the maxi-

mum water line is fixed at the centre of the shell by raising the overflow dam. This dam is shown at the rear end and controls the overflow and acts as a skimmer for same. The overflow pipe is attached near the bottom of the back

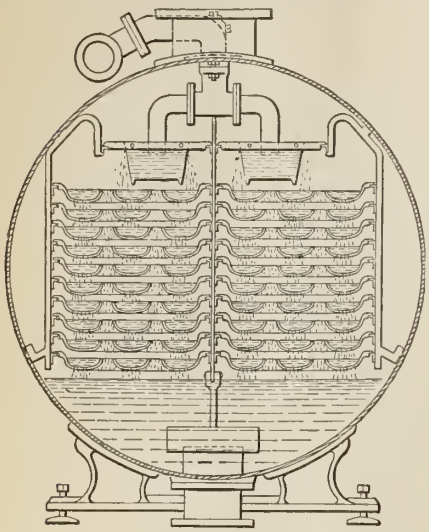


Fig. 1—Hoppes Feed Water Heater.

head. The water is admitted to the heater by a balance regulating valve and regulated by a float in a separate float chamber.

In operation the water is delivered into the feed-troughs through the feed-pipe shown at the top and is evenly distributed by means of discs having uniform openings placed between the flanges of the tees in the feed-pipe and

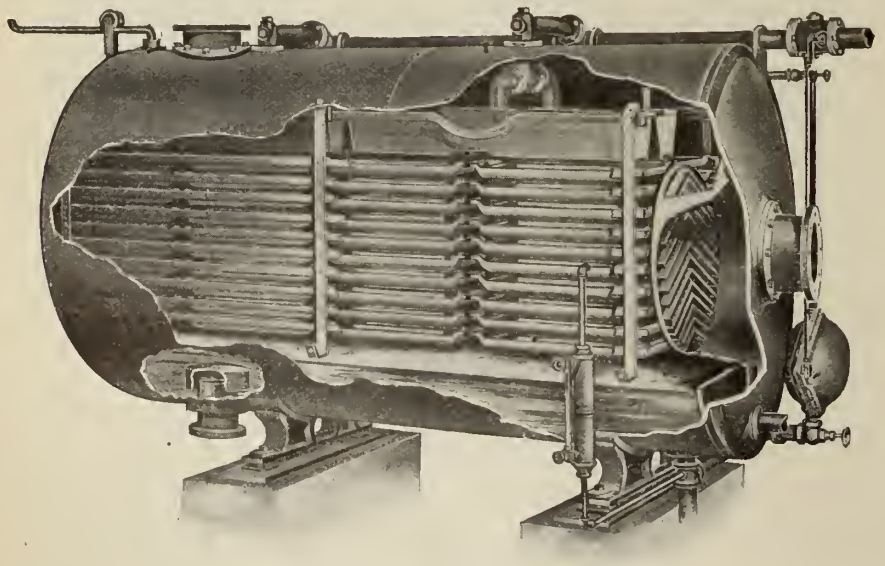

Fig. 1—Hoppes Feed Water Heater.

the L-shaped connections extending down into the feed-troughs. The water overflows from the troughs into the pans and overflowing the sides it follows along the under side of the pans in a thin film to the centre of each trough before dropping down into the next pans. While following the under sides of the pans, the exhaust steam will come in contact with the water and heat it to the full temperature of the exhaust. All the solids which may be held in solution in the water will, when liberated by the heat, form mostly on the under side of the pans, while matter in suspension will be deposited inside of the pans. As the water continues to follow the under side of the pans, or the lime already formed, the full efficiency of the machine is realized until ready to clean. The oil catcher provided is very large and efficient.

In open heaters of large size the regulation and distribution of the water is a very important matter, as to be effective the steam should come in direct contact with the water, and to do this the passage of the water should be gentle and as free from agitation as possible. The principle of flowing the water evenly over the under side of the pans in these heaters brings this about in a most practical manner.

By the use of the artificial regulation provided in this heater, the water is not only evenly distributed to the pans, but two or more heaters may be used in multiple by providing a single regulating valve in the main feed-pipe controlled by a float attached to an equalizing pipe at the bottom.

COAL HANDLING MACHINERY.

The problem of supplying fuel to large boiler houses has received a great deal of attention during the past few years, and several types of machines have been built for the rapid unloading of fuel barges. The type which is obtaining considerable success in the eastern part of the country is the two-man steeple with horizontal boom. These towers have been made both of steel and timber construction, some a combination frame with timber struts and fitted with steel booms.

One of the examples of recent installation of this character is the steel tower erected at the plant of a large sugar refinery in Philadelphia. This tower is shown in the accompanying view, which brings out the rather heavy style of construction. This equipment is de-

Jeffrey Coal Handling Mechanism.

signed to unload barges which come in a rather narrow slip, and which lie head on to the unloading tower. The coal is elevated, crushed, screened, weighed and delivered to the belt conveyer, which carries it to the boiler plant, located some 300 feet away. This work requires the services of two men on the tower; and one, and part of the time two, men in the barge to help clean up and guide the bucket during the last part of the unloading.

The tower proper is an all steel structure made up of lattice channel columns, with stiff bracing. The structure contains five distinct floors or levels in it, made up of heavy planks laid on steel floor beams. All floors have, in addition to the heavy planks, a wearing surface made of 1-inch hardwood flooring laid diagonally. The first or lower floor contains the hoisting engine, and the engine for driving the crusher; the second floor contains automatic scales; the third floor a four-roll crusher; the fourth floor, receiving hopper; the fifth floor is at the level of the boom which supports the trolley, and there is, in addition, a crow's-nest around the head sheave which allows easy access for the inspection of the bearings located at this point. All the floors which are outside of the house proper are well provided with hand railings. The cabs protecting the operators are two in number, located at opposite sides of the tower.

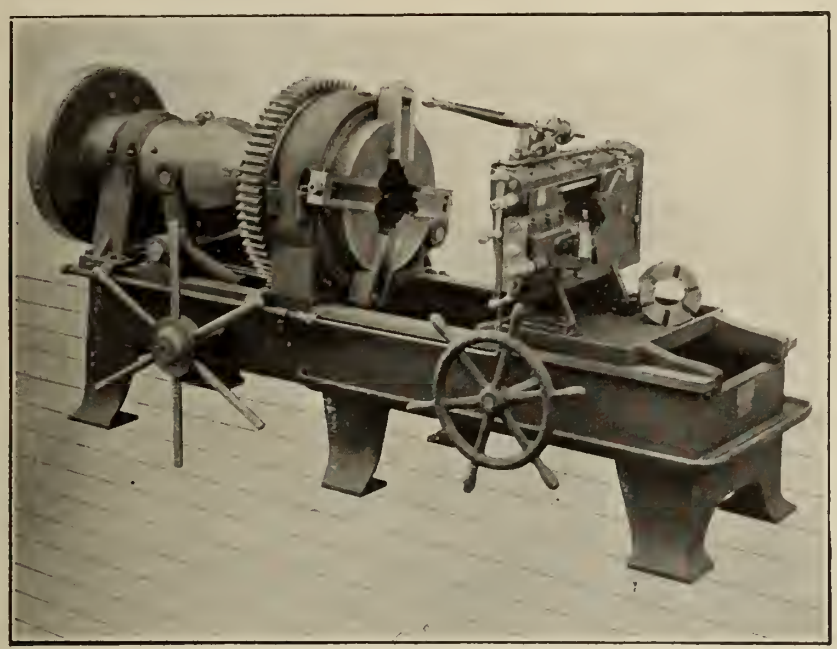
In one cab is placed the bucket man who controls the hoisting, lowering, opening and closing of bucket; in the other the trolley man who controls the motion of the trolley along the boom. These cabs are very well provided with windows; in fact, three sides are all glass. The covering used is heavy galvanized corrugated sheet, made of rerolled iron.

Extending from the lower engine floor to the fourth, or hopper, floor is a housing made of heavy corrugated galvanized sheet iron. The hoisting machinery used to handle the bucket and trolley consists of one Lidgerwood Steeple Standard hoisting engine fitted with two cylinders 15 x 24 inches, direct connected to 30-inch drums equipped with 54-inch double cone friction automatic brakes. The trolley engine consists of a pair of 10 x 12-inch engines, direct connected to a 16-in drum fitted with cone friction and band brakes.

The arrangement of levers for controlling the hoisting engines is very simple, and each operator has but three to handle, one for each hand and one for his foot; the foot lever in each case controlling the throttle on the engine. The bucket with which this tower is equipped is the second of its type which has been placed in service along the eastern coast, but still is only one of a number of the large group which are working successfully in handling sand, gravel, broken stones, coal and other materials at different points throughout the interior of the country and along the Pacific slope. It differs in many points from the ordinary clam shells with which our readers are, no doubt, familiar, and will handle successfully materials which the clam shells cannot penetrate. In this particular instance the equipment will have to handle large lump coal more than half the time, and in order to obtain the desired capacity the bucket must be able to handle the large coal as rapidly as the small. The equipment is designed for continuous capacity of 120 tons per hour from barge to receiving hopper. The hoist from barge at mean tide water to the hopper is about 60 feet, and the length of travel is 57 feet.

In the hands of expert runners, with this height of hoist and travel, coal can be unloaded at the rate of 200 tons per hour. The equipment was designed and built by the Jeffrey Mfg. Co., Columbus, Ohio, with Canadian office on Cote street, Montreal.

The view was taken while the tower was in process of construction, and does not show the covering which was afterwards placed upon the steel frames.



New Pipe Threading Machine.

NEW PIPE THREADING AND CUTTING MACHINE.

A new size pipe threading and cutting off machine, known as the P.D.Q.C. No. 6, has recently been brought out by the Bignall & Keeler Mfg. Co., Edwardsville, Ill. The machine is particularly adapted for shops having large quantities of pipe of one size to thread at one time. It is equipped with a quick operating chuck, controlled by a hand wheel and pinion which engages in a segment gear on the end of the cone shifting arm. The cone slides freely on the arbor; as it is moved forward rollers on the ends of the chuck arms roll up on the surface of the cone, and the arms being thereby spread apart tighten the jaws on the pipe. When the cone is retracted, springs draw the jaws away from the pipe. As this gripping chuck can be operated while the machine is running, the jaws being set for a given size of the pipe, an entire lot can be threaded without stopping the machine. The steel jaws in the chuck are graduated, which facilitates the setting for a given size of pipe.

The die head is of the peerless type, as used on the machines of similar type, manufactured by this company, in which the dies can be instantly released from the pipe after the pipe is threaded. The cutting off tool is held in the slide in the front of the die stand and a reaming tool for removing the burr from the pipe is also provided.

The rear chuck is provided with three independent jaws with which fittings can be made up, and also a bushing for holding the pipe central without gripping the pipe.

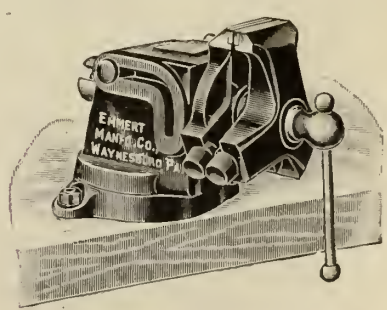
The drive is from a four-step cone pulley at the back which, in connection with compound shifting gears, affords eight changes of speed. The machine can be arranged to be driven by belt or motor. An automatic oil pump in the bed of the machine supplies oil to both the dies and the cutting off tool.

The machine illustrated occupies a floor space of 50 x 120 in., and weighs in the neighborhood of 7,500 lbs. Ten other sizes of the machines are made, ranging in pipe capacities from 1¼ to 6-in. diameter, inclusive.

THE EMMERT UNIVERSAL VISE.

A new type of vise which is rather out of the ordinary is being placed on the market by the Canadian Fairbanks Co., known as the Emmert Universal vise.

As the name suggests, this vise is universal, and has every possible adjustment which the workman could find convenient. Thus quick work in shaping, finishing and fitting is facilitated greatly. While in service the vise can be swung into any desired position without necessitating the releasing of its hold on the article gripped within the jaws. The vertical position gives the advan-



Emmert Universal Vice.
